Grass is also an important product to the New England farmer. As much land in the present state of agriculture is probably employed to furnish food for cattle as food for man. In a climate where, for so large a portion of the year, it is necessary to feed animals with fodder prepared and stored for the purpose, it will continue to be the case, as long as animals furnish the motive power to so great an extent as at present. This vegetable furnishes the principal food for the horse, the ox, the cow, and the sheep, all in their respective places most valuable animals to the farmer. The farmer cannot place too much importance upon the production of food for cattle in sufficient quantities and of an improved quality. How much depends upon this in carrying on the various operations of agriculture the immense interior transportation, the business and the pleasures even of the whole community! That valuable animal the horse, by whose cheerful services the numerous and various assemblages of men for purposes of business, of benevolence, or pleasure, are effected

by which distant relations and friends are brought together and enabled to enjoy the highest pleasures of social intercourse; by which our comforts and luxuries from foreign countries are brought from the sea coast to our own doors, and the almost infinite variety of exchanges of our interior productions are accomplished; by which, in short, we are enabled at will to change our locality, and move from place to place for the accomplishment of all the infinitely diversified business, employments, enjoyments and improvement of life, should, surely, be kindly treated, and at all times furnished with suitable food and in sufficient quantity. The patient ox, whose steady and uniform exertion of that superior strength with which nature has endowed him turns up and subdues the most stubborn and refractory soil, pulverizes the earth, and thereby enables the farmer to cover his fields with abundant harvests, should certainly be cared for by the farmer; and allowed to partake liberally of a portion of those products, which he has been so greatly instrumental in raising. The valuable milch cow, who daily delivers to her owner her rich treasures of ready prepared food; and the sheep, who gives the covering of his own body to furnish materials for the clothing of man, should not be stinted in their allowance of food. Perhaps the time will come, in the progress of improvement, when the services of some of our useful animals will be dispensed with. May we not anticipate the time when the greatest portion of the lands which are now appropriated to the raising of food for the horse and the ox, will be released from this burden, and be employed in the more pleasing use of raising food for man; thereby increasing and cheapening human subsistence, and leaving a large surplus of property or time, or both, for the improvement of his moral and social condition? This is not the proper place to enlarge upon this subject; but I cannot refrain from saying that it does not require much of the spirit of prophecy to foresee, that soon, and sooner than many are aware, we may see steam carriages of every size, traversing our common roads in every direction; and steam horses, ploughing our lands, and transporting the rich-burdens of our farms. Does any one say that these are the dreams of a visionary? Let him look back thirty years, and see what would then have been thought of a man who should have predicted what is now actually come to pass, what we can see with our own eyes, and what is daily exhibited to our senses, of the wonderful power of steam; and consider, that this mighty power is almost daily, by the ingenuity and enterprise of man, applied in some new way, pleasing and beautiful and useful; extending gradually, constantly and certainly, to almost every object of human pursuit industry and enterprise. The examples which I have taken of the principal product of our own climate, and our own immediate vicinity, are but examples. Other products, numerous, various and valuable, too numerous to be noticed in this limited address, are the productions of our farms, and greatly administer to the necessities, comforts and luxuries of the cultivator. The employment of a New England farmer, the business of agriculture as it respects him, is not confined within narrow limits, but takes an extensive range, and includes all those products which can be advantageously raised upon a farm, either as food for man, or food for beast; either as furnishing materials for manufactures or articles of commerce;

either as administering to necessity, or to comfort and luxury. Horticulture, which is but a branch of agriculture, with all its numerous, useful and beautiful variety of production; the cultivation of fruit trees; the introduction and cultivation of the grape, so far as it may be suited to our soil and climate; the mulberry tree, to furnish food for the silk worm; and the production and preservation of forest trees for fuel and timber, are all legitimately within the limits of a farmer's industry, and should be, as circumstances are favorable, the objects of his care. While I am upon the subject of the importance of agriculture, I will briefly notice some of the rich products of other countries. The *cotton plant* seems to have been the gift of a beneficent Providence for the special purpose of furnishing clothing for the greater part of the human race, and especially the poor. It is the cheapest material for clothing yet known, and probably the cheapest that ever will be known. Almost the whole clothing of the inhabitants of warm climates, and a considerable portion of those of colder countries, is supplied by this valuable plant. When we consider how great a portion of the earth's surface is adapted to the cultivation of this plant, the ease with which it can be produced, and that its production may be increased to an almost indefinite extent, what limits can be assigned by a warm and benevolent heart to the gratitude which is due to the Creator, for so great a boon? Did I say the production of other countries? It is the production of our own country, though a different climate. Yes, within the limits of the United States there is land enough adapted to the cultivation of this plant, and more than enough to clothe all its inhabitants. How pleasing, if time would permit, to trace this material from the simple state in which it appears, as an article of commerce, through the almost infinite variety of its manufacture, from the coarse garment of the day laborer, to the rich muslin of the palace; administering to the necessities, the comforts, the luxury, and the pride even, one or all, of every individual in the community? But, I forbear; the task though pleasing would be inappropriate, and I will merely say that if this simple material, the cotton of commerce, should be traced through all its variety of manufacture, and all the modifications of its use throughout the greater part of the habitable globe, it would manifestly appear, to any benevolent mind that its gift to man was a signal instance of the benevolence of the Deity.—The *sugar cane* is also the production of our country, though not of our climate. Sugar was once a luxury; it is now a comfort most extensively diffused, and has almost become a necessary of life. It is a nutritious and healthy food, enters extensively into the cookery of the middle and higher classes, and gives a zest to the delicacies of the epicure. The extensive and various use of this article among all classes of the community capable of purchasing it, show it to be one of the most important productions of agriculture. It shows, satisfactorily, how much the discovery, cultivation and use of a single useful plant will conduce to the comfort and happiness of man; and affords ample encouragement to the farmer to discover and introduce to cultivation other extensively useful vegetables.

The *tea plant* is of extensive use, and furnishes a valuable article of commerce. Though the countries where this plant is cultivated, to which it is indigenous, and where alone probably it can

be cultivated to advantage, constitute but a small part of the earth, yet a sufficient quantity may be produced to furnish to every member of the community at a moderate expense the indulgence of this favorite beverage. It is not necessary to take up time in eulogizing this vegetable. Its good qualities are known to all. It enters so extensively into the domestic economy of every civilized community; it has such an intimate acquaintance with household affairs, that every individual has felt its comforting, consoling and exhilarating power. It is sufficient merely to name it among the agricultural productions of the earth which are most distinguished for extensive usefulness. It may seem inappropriate in an address to the farmers of New England to speak of the valuable productions of distant countries. But agriculture is the art of cultivating the earth in such a manner as to render it useful to man, and the successful cultivation of useful plants in other countries may afford to the farmer here useful information as to the cultivation of our own important products, and at some future period lead to the discovery of some plant which by its congeniality to our soil and climate and skill in its cultivation, may take the same place in the commerce of the world and the extensive benefits which it distributes, as the cotton plant, sugar cane and tea plant.

Let not the circumstance that other portions of the earth produce plants apparently more valuable, calculated to have a more extensive circulation, and to occupy a larger space in the commerce of the world discourage the New England farmer, or lessen in his eyes the importance of his own agriculture. The productions of your agriculture are such as are adapted to your soil and climate, and though not so showy, nor so well calculated for distant transportation, being bulky; the same value cannot be brought within so narrow a compass, and they are not in such extensive demand over so great a part of the earth as the products of some other countries; yet the productions of your agriculture are substantially useful and highly valuable. They furnish to you and your families the necessities, comforts, and some of the luxuries of life; and there is sufficient demand for the surplus to enable you to purchase in sufficient quantities the rich products of those seemingly more highly favored countries. Though your lands may not be so fertile, though your productions may not furnish such valuable articles of exchange and an extensive commerce as those within the tropics, yet the climate in which your products are raised is comparatively mild and temperate, and you have the means of personal comfort and happiness to a much greater extent than the inhabitants of warmer countries. The same fervid sun, the same heated atmosphere which ripens and brings to perfection the vegetables of the tropics, enervates the body, diminishes the strength greatly, impairs the comfort and endangers the health of the laborer; and at the same time brings into existence myriads of reptiles and insects. Let not then your comparative agriculture be undervalued, and because you cannot produce what are called the great staples of the world neglect and under-rate those useful productions with which Providence has blessed you. It is enough that there are plants adapted to your soil and climate, which, if properly cultivated, will abundantly supply all your wants, either directly by their own use, or indirectly by furnishing the means of purchasing others. It is enough that the farmer here, by a

a well directed industry can supply himself and family with the necessities, comforts, and some of the luxuries of life, and by a sale of the surplus furnish all those comforts and luxuries of foreign countries which can add any thing to the enjoyments of life.

It should be enough, even if your agriculture labored under considerable disadvantage compared with that of other countries, that you, here, enjoy a temperate and healthful climate, a free government, political, benevolent, moral and religious institutions, decidedly superior to that of any other country. It should be enough to satisfy the New-England farmer of the happiness of his lot that the climate in which he lives, the soil he cultivates, and the plants which nature has adapted to that soil, are all calculated to promote health of body, and vigor of mind: and if he will be true to himself, and improve the advantages, within his power, he has greater means of real happiness, greater means of a comfortable subsistence, greater means of improving his mind and social condition, than the cultivator of the soil in any other part of the world. Agriculture, which, strictly speaking, is merely the cultivation of the earth, may be carried on by different nations and different individuals in a very different manner. It may be carried on in such a manner as merely to afford a miserable subsistence to the cultivator of the soil, and leaving large portions of the earth's surface to the dominion of the primeval swamps and forests: or it may be carried on in such a manner as to extend over the entire cultivable portion of the land, and so as to leave a large and abundant surplus of produce beyond the subsistence of the laborer for comfort and luxury: to furnish the raw materials of numerous and valuable manufactures: and to provide the means of a rich and flourishing commerce. When I speak, then, of the importance of agriculture I speak of it not as simply the cultivation of the earth; but I speak of agriculture improved, enlarged, systematically and successfully pursued. An agriculture which spreads over the greater part of the surface of the country: occupying, and usefully occupying most of the land capable of profitable tillage: an agriculture which not only subsists, and comfortably subsists the laborer, but also furnishes to himself and family numerous comforts and luxuries, the materials of manufactures and commerce. And also indirectly, by a sale of the surplus products, the means of education, and of moral and religious improvement. [To be continued.]

COMMUNICATIONS.

For the New England Farmer.

APPLES FOR SWINE.

FARMERS seem very generally, to think that sour apples are useless as food for cattle or swine. But this opinion is very incorrect. Sour apples were not made in vain. When mellow they make excellent food for hogs, and probably for all other stock. Let farmers who doubt this decide it by experiments. For myself I have no doubt.

To feed apples to hogs make them into pomace by cutting them with a shovel, or by mashing them. Then put in some meal or bran, and let them stand till they get into the saccharine fermentation, then as you feed put in your sour milk or whey. Hogs fed with this food will fatten very fast, and do not seem to cloy as on richer food.

Fermentation takes place very soon in warm

weather. The quantity of meal used should vary according to circumstances.

Winchester, Conn. Dec. 30, 1833.

PUMPKIN.

GEORGE C. BARRETT, Esq.

Dear Sir:—I send you a hard shelled Pumpkin, weighing forty-two pounds and a quarter. Its formation is very uncommon, and may be a subject of interest to gentlemen who visit your very useful establishment. It is of the kind most common in this county, and most highly esteemed. If the seed be planted in the interior of the country, the pumpkins soon degenerate, and become soft shelled.

Yours, &c.

Edgartown, Jan. 1, 1834.

MASS. HORTICULTURAL SOCIETY.

Horticultural Hall, Jan. 4, 1834.

EXHIBITION OF FRUITS.

APPLES. By Mr. A. Painter of Cummington, Ms. *Roxbury Russels*, the growth of 1832, in good condition, preserved in sand. Another specimen of the same fruit, preserved in the open air. Also *Winter Sweet*, a round fruit of a russetty color, and good size, of a sweet and pleasant flavor—another kind of winter sweet, a round fruit of medium size, a native of a russetty color, mixed with russetty red, of good flavor—Another kind, name unknown, striped with red on a yellow ground, below medium size; its flavor pleasant; and resembling the *Wine Sap*.

By Mr. Nathaniel Davenport of Milton, *Seaver Sweeting*, sometimes called *Winter* or *Grafton Sweeting*, a fine, fair fruit, well known—it keeps till April.

By Mr. Downer, an apple, name unknown, rather large, roundish, or conically formed, of a white color, with a blush next the sun, of a rich, agreeable, spicy and peculiar flavor. Also another variety, without name, very large, flattened, of a red color, striped; of a rich, pleasant, subacid, and excellent flavor. This fruit was sent from Genesee, N. Y., 137 filled a barrel.

PEARS. By Mr. Payne, a variety without name, of a rich and agreeable flavor.

AMERICAN CITRON, by Mr. L. Ellis of Franklin. A preserve of the *Citron Water Melon*, and resembling in taste and substance, and equal in quality to the imported citron.

Per order of the Committee,

WILLIAM KENRICK.

From the New York Farmer.

CAPE FLORIDA NURSERY.

I AM told that the St. Helena will suddenly start to-morrow, at 9 A. M. I fear these dilatory Mexicans will not have the hive of stingless bees ready. I want also to send you, if possible three young plants, viz: a true *pulque* Agave, a true *Henequen* Agave, and a true Pita plant, Bromelia or Furcraea, which you should have the greatest possible care taken of, as they give a death-blow to the voracity and intelligence of Humboldt. Should they go, exhibit them likewise at the American Institute, if they arrive in time. As I can keep my nursery under way, provided J. Dubose of Cape Florida is persevering, through Sagra, at Havana; and as my fellow trustees in the T. P. Company seem to hold back for the law giving the township

of land, I shall remain here till I have news of its passage. Perhaps I will have time to-night to write a short address to the Horticultural Society, which I wish you to present and explain. If they and their brethren throughout the Union would do any thing in their own way, to forward the enterprise, it would soon be completed.

H. PERRINE.

FOREIGN GRAPE VINES.

MR. GOODSSELL—Sir:—I have some fifty grape Vines of different foreign varieties.

They are now loaded with their third crop of fruit, all of them are suffering more or less from mildew. This I suppose was to be expected. But there is one fact in regard to them, which I noticed to day, while looking them over and applying Prince's remedy, to which I wish to call your attention, viz: That the fruit farthest from the ground suffers the most from mildew; and that without reference to its nearness to, or remoteness from the root. Vines which grow up 3 or 4 feet, and then bend over near the surface of the ground again, have the fruit on their two extremities almost free from mildew, while that on their centre branches, being the farthest from the ground, is almost ruined; and some clusters lying directly on the ground and hid by the leaves, have escaped the malady entirely.

I have never known low training recommended as a preventive to mildew, but my experience this season would seem to point to it as such.

Yours,

H. M.

From the Northern Farmer.

RECIPES IN DOMESTIC AFFAIRS.

Pressed Beef.—Take a piece of the flank, brisket, or other part, freed entirely from bone, pickle it, for five or six days, in a brine made of common salt and sugar in the proportion of a quarter of a pound of sugar to a pint of salt; then boil it gently till very tender; wrap it in a strong cloth, and press it under a heavy weight, or in a cheese press till perfectly cold. It is fine, when eaten cold, or for Sandwiches.

Hunter's Beef.—Remove the bone from a round of beef weighing twenty-five pounds; and when it has hung two or three days, take three handfuls of salt, four ounces of brown sugar, one nutmeg, half an ounce of cloves, and some pimento; reduce them all to a fine powder, and rub well the beef, turning and rubbing it daily for two or three weeks.—When to be dressed, dip it into cold water to take off the loose powder; bind it tight with tape; put it into a pan with a teacup of water at bottom; put over the pan a brown crust and paper; and bake it five or six hours.—When cold remove the crust and fillet. Cut with a sharp knife, and serve cold.

Italian Beef Steaks.—Cut your steak large, from a rump, that has been well hung, or from any tender part; beat it with a rolling pin, and season with pepper, salt, and onion, if approved; lay it in an iron stew-pan, with a close cover, without water; set near the fire, let it have a strong heat; but be careful it does not burn. In two or three hours, it will be quite tender; serve with its own gravy.

From the Maine Farmer.

MANURE FROM SHEEP.

I wish farmers to rightly understand the value of the several kinds of manure. I have heard that some people apprehend that the manure from sheep is useless for the purpose of growing vegetables. Will such tell me if a ton of hay is eaten by sheep, as they chew the cud, or are ruminating animals, as well as what are called black cattle, why that ton of hay thus passing sheep, is not as valuable for manure as though it passed oxen or cows. The fact is, it is as good; and as no animal makes hay finer by mastication than sheep, I believe no manure is better, except that all manure, as to its quality depends much on what the animal eats. Thus while you are fattening a beef creature, its manure is richer than if it eat hay or grass only. That from swine or the back-house proves this. So far from sheep manure not being useful, much more might and should be made of it—it is a waste to let sheep lie in their pastures during the summer nights. Their manure being fine is carried off soon into the air, and if that element can be enriched, it takes place by such slovenly practice.

Let the sheep be placed in the night, if you have 50 or 60, in about an acre of ground fenced off with some suitable fence—let a boy place them there every night. Plough or harrow it frequently; and my word for it, they will manure it abundantly for any crop the next season, or for turnips in the fall of the same season. If sowed to turnips they may reasonably prepare another acre that year. Thus we obtain the advantage of their urine, and all their droppings. A farmer who will manage in this way, will never complain that his sheep manure is worthless. Horses are not ruminating animals; their manure, of course, is not so fine, but lighter. For low or moist land the same weight of it is as valuable as other manure. As it is more open, its effects are sooner exhausted if we reckon by bulk and not by weight. If any farmer thinks the above ideas incorrect, the writer hopes he will show his views through the Farmer, and oblige

A CORRESPONDENT.

From London's Magazine. CROPPING BORDERS IN WHICH FRUIT TREES GROW.

SIR, Having for some years been an advocate for not cropping the borders of fruit trees, I have noticed, with pleasure, that you have several times called the attention of your readers to the subject. I beg leave therefore, on the present occasion, to make a few observations for the consideration of those who are of a different opinion; as I think that, before long it is very likely that, instead of having a border of 10 or 12 ft. wide close to the wall to be constantly dug and cropped, and a gravel walk 4 or 5 ft. wide beyond it, we shall see a wide gravel walk close to the wall over a previously prepared border; for I am persuaded it is owing more to the digging and manuring the border, than to any other circumstances, that there are so many failures of fruit trees. I have seen the above method (of gravelling the borders to walk upon) practised on a small scale and I am not aware of a single failure. I have often noticed that, in the formation of borders to vineries or green-houses where vines were to be planted, after much expense and labor bestowed, it has ended in disappointment; the cause of which I consider to be the planting of the border with vegetables if in the kitchen garden, and with flowers if in the flower garden. Perhaps it may not be amiss to mention here, that many persons who are very particular about pruning their vines in the autumn, to prevent their bleeding, will nevertheless delay digging the borders till February or March, when all the roots within the reach of the spade are sure to be cut and made to bleed, without being observed. In many cases where prepared borders have failed to produce fruitful vines or other trees, it is very often to be seen that a tree or vine, planted against a building merely for the sake of hiding it, seldom fails to produce a crop of fruit, although it has nothing below but the natural soil, and this covered over with gravel, or other materials to form a walk. I could mention several instances of this kind, some of which are within a few yards of where I am writing, and many others in the neighborhood; and I have no doubt that many of your readers will be able to see the same, after it has thus been pointed out to them. One of the instances which have come under my observation is within a short distance of my cottage. It is an extensive range of glass, used chiefly for stove and green-house plants, with a vine trained up each rafter, not one of which is worth the trouble bestowed on it annually in tying, &c. The roots of these all running directly into the borders and clumps of a flower garden, it is not thought that the fault can be in the soil, as it is so well cultivated for the plants in it, but this I consider to be the only cause of their failing; as within a few yards of these is a building of considerable height and length, of the same aspect as the others, having vines trained all over it, which are planted (as far as I can learn) in nothing but the natural soil having a wide gravel walk over their roots, beyond which they have nothing else but a lawn. They have, therefore, in all probability never been disturbed since they were planted. These I have known for several years, but I do not recollect ever having heard of their failing to produce good crops. Young vines also, which have been planted among them, have begun to bear. Instances of this kind are so numerous, in front of dwelling houses and other buildings, that it is unnecessary for me to say any more on the subject; I shall therefore conclude with hoping that those who have hitherto attributed it to the soil will reflect whether in some measure it may not be owing to the cause I have mentioned.

I am, sir, yours, &c.

R. T.

Feb. 26, 1833.

From the Gardener's Magazine.

STRAWBERRIES.

The Fruit of Strawberries preserved free from Grit, and the Attacks of Slugs, by covering the Soil under the Fruit with a Layer of the short Grass mown off Lawns.—As the fruit of the strawberry is, with many, a thing of consequence, the preservation of it from the several casualties to which, on its attaining maturity, it is liable, is, or ought to be, an object of as much solicitude: to point out a preservative from one or more of the evils which endanger it, will be my endeavor in the present communication. I generally grow the large sort in rows from 20 in. to 2 ft. apart, and a considerable quantity in a single row between the box edging and the gooseberry bushes, which form the narrow border of the quarters. These distances I consider the best for Keen's seedling, Wilmot's superb, &c., the crop of which is as good in the fifth year as in the third, and better than that in the second. The small sorts, as the early scarlet, Duke of Kent's scarlet, the Roseberry, &c., may be grown with as much advantage on narrow beds, 3 ft. or 4 ft. wide, and if renewed every three or four years. In the case of the smaller sorts, they being so close together, the following method might be dispensed with, or, at least, it is not necessary; but in the large kinds above named, owing to the isolatedness of the rows, and the heaviness of the bunches of fruit, these latter lie on the soil, and, when rain falls, are covered with grit; and they likewise lie so convenient for slugs, that many are destroyed by them. To obviate these liabilities, I have tried several expedients, but none had the required effect, until it occurred to me this season that short grass laid between the rows would answer the purpose. This I have applied with perfect success, especially as to the grit. There is no gentleman's place without the material at the time at which it is required for this purpose, and the application of it 2 in. or 3 in. thick does not consume much time. It is not only useful in the above instances, but it acts as a non-conductor of evaporation from the soil below, whether you water it artificially, or the more general rain administer the moisture; it also chokes most sorts of weeds, and destroys the vegetation of their seeds; and it may be taken off, or allowed to remain, after the crop is done. It is best to ap-

ply it in a dry time, before the strawberries begin to get ripe; when the slugs have sought shelter in less exposed situations; after which it forms so bad a path for them to slide along, that they cannot overcome the difficulty. If any should remain, a watering with lime-water, or urine (as Mr. Gorrie recommends), will extirpate them. The above may not be new to some gardeners; but, as I have never heard it suggested, nor seen it done, it may be to a few, if not to many.—*George Thomson. High Elms, July 1, 1833.*

GREAT TURNIP.

A Norfolk Tankard Turnip grown in Ireland to the Weight of Thirty-Six Pounds Avoirdupois.—Sir, As a matter of curiosity, and to show you that we have both a fine climate, and a productive soil (indeed I do not remember ever seeing an old abbey or cathedral situated otherwise), I may mention that a Turnip of the Norfolk tankard variety was pulled in this demesne, which weighed no less than 36 lbs. avoirdupois.—*J. Elles. Palace Gardens, Armagh, Dec. 1832.—Gardener's Magazine.*

HINTS AND RECEIPTS.

If you have a greater quantity of cheeses in the house than is likely to be soon used, cover them carefully with paper, fastened on with flour paste, so as to exclude the air. In this way they may be kept from insects for years. They should be kept in a dry cool place.

Woollens should be washed in very hot suds and hot rinsed. Lukewarm water shrinks them.

Suet and lard keep better in tin than in earthen vessels.

Suet keeps good all the year round if chopped and packed down in a stone jar, covered with molasses.

To cook Salsify or Vegetable Oysters.—Cut the roots transversely into thin pieces, boil them in a little water—when boiled soft, mash them, and thicken the whole with flour; and then fry them in fat of salt pork, or in butter. They are a luxury.—*N. Y. Farmer.*

HORSES.

Sore Tongue. This distressing disease, we learn, prevails extensively among horses in this vicinity. We have handed us for publication the following Recipe, with the assurance that it is an effectual remedy for this sore disorder.—*Amh. Cab.*

Cure for Horses sick with the Sore Tongue. Take 2 oz. alum, 1 oz. borax, half oz. blue vitriol, $\frac{1}{2}$ oz. copperas, $\frac{1}{2}$ lb. honey, and one quart of vinegar, with a little sage—steep, and make a wash, with which cleanse the mouth of the horse three times a day, taking care to keep him from taking cold.

From Goodsell's Genesee Farmer.

Black Tongue.—Preventive. Take one ounce of assafoetida, divide it into two parts, wrap them in clean linen rags, and nail one part in the bottom of the manger where the horse is fed, the other in the bottom of the bucket in which it is watered. These will last for three months. A small piece confined to the bridle bit when the horse goes from home will act as a preventive.

Cure when the disease has commenced. Take one pint of Castor Oil, two ounces Balsam Copaiva, two ounces Sweet Spirits of Nitre, let these ingredients be well mixed in a bottle and given.

Symptoms of the disease, are soreness in the mouth, tongue red, raw in spots, slaver.

From the Poughkeepsie Journal.

INTERESTING ITEMS.

We gather the following items from a variety of sources.

French cake.—Take five common sized tumblers full of sifted flower, three tumblers of powdered white sugar, half a tumbler of butter, one tumbler of rich milk or cream, and a teaspoonful of pearl-ash, dissolved in as much lukewarm water as will cover it. Mix them all well together in a pun. Beat three eggs till very light, and add them to the mixture. Throw in a teaspoonful of powdered cinnamon or nutmeg, and beat the whole very hard about ten minutes, butter a deep pan, put in the mixture, and bake it in a moderate oven.

To cure Hams.—A friend recommends the following receipt. He ate hams preserved in this way in May last, and found them superior to any he had ever before eaten. Take one pound of salt, one ounce of saltpetre, well pulverized and mixed, with about two quarts of molasses, rub the hams thoroughly with this mixture, lay them flesh side up, and let them remain for 18 or 20 days.

To improve Candles. Steep the candlewick in a strong solution of saltpetre and water, and dry it well before dipping them. Try it once and you will find the advantage gained.

To take Ink Spots out of Cloth or Linen. Wet immediately the place with lemon or sorrel juice, or with white soap diluted with vinegar.

To prevent Snow-Water from penetrating Boots and Shoes. Take equal quantities of beeswax and mutton suet, and melt them together in an earthen pipkin, over a slow fire. Lay the mixture while hot on the boots and shoes, which ought to be made warm also, let them stand before the fire a short time for it to soak in, and then put them away till quite cold: when they are so, rub them dry with a piece of flannel, in order that you may not grease your blacking brushes. If you black them well before you put the mixture on, you will find them take the blacking much better afterwards.

Cure for Oxen strained by overdrawing. About half a pint of common soap stirred up with a quart of milk, poured down the throat of the creature, will, we are told speedily effect a cure.

From the Northampton Courier.

STUMP EXTRACTORS.

THE Genesee Farmer, a few weeks since, made inquiries about the operation of Stump Extractors, and wished for information respecting them. A correspondent who has seen them in operation, furnishes us with the following particulars:—

"The common method and that with which I have been longest acquainted, consists in a perpendicular lever from 18 to 24 feet long, (according to the size of the stump to be removed). One end of the lever is made fast to a large root of the stump as near as possible to the trunk; the highest part of the stump is next fastened to the lever at a point which becomes the fulcrum. The power is then applied by a long and heavy chain to the end which is in the air, and thus the stump is easily torn from the earth. Two yoke of oxen will remove a stump of the common or midling size without difficulty; but the earth must be previously removed from around the stump, and some or all of the roots must be cut away with the axe."

Another and better method is the *Horizontal* lever, one end of which is fastened to a root of the stump and to its trunk, (others say to a neighboring stump where there are many in a field) the power is then applied to the remote end of the lever, and the stump at the opposite end, or the stump which is used as a fulcrum, must give way, more commonly the former. A small wheel is advantageously placed under the end where the power is applied; causing it to run over the ground more easily than otherwise. By this method two yoke of oxen and three men may easily remove about 40 stumps in a day, if they are of hard wood, and somewhat old, (in which case little or no digging will be necessary,) or perhaps 20 green stumps of hemlock, pines, &c.

The last and best stump machine I have seen or heard of consists in a *wheel and axle*. A large but simple frame is supported by two upright posts within the frame, and upon the uprights an axle is made to revolve by a wooden wheel of some ten or twelve feet circumference, with a strong chain passing around its periphery. Two yoke of oxen will turn the wheel, and thus another chain fastened to the axle and to the stump under the machine is wound around the axle until the stump is torn from the earth. The machine though light is somewhat unwieldy; but the difficulty of transporting it from one stump to another might be removed by affixing wheels to it, and this would in no wise interfere with the operation of the machine. It is difficult to say how many stumps might be pulled in a day in this manner, for such computation would be influenced by a variety of circumstances, such as the character and size of the stumps, the nature of the soil, &c.; but many hundred acres of the New England territory have been cleared by this machine at the rate of ten dollars the acre; and in some instances large tracts of land which were once thickly wooded have been rendered stumpless for the small sum of eight dollars the acre, every stump exceeding six inches in diameter, being removed."

From the New-York Farmer.

GRASS CLOTH, &c.

I observe in the advertisements of the New-York Courier and Enquirer, of August 16th, under public sales, the following: 66 cases assorted bleached and brown grass cloth, and fine and extra fine grass cloth, handkerchiefs; 850 bales and cases Chinchu, Bamboo, and other fancy baskets; 40 cases Suchan Pongees, 20 do. Cochineal and white Pongee handkerchief; 60 dozen fancy cane seat chairs. Cannot you enlighten us in your next number relative to the vegetables which furnish these materials?

H. PERRINE.

FLORIDA PRODUCTIONS.

I presume you have observed that the Charleston Mercury remarks that "no doubt can longer exist that the productions of the West Indies may be profitably cultivated in the peninsula of Florida. The Sloop Capital, arrived yesterday from near Cape Florida with a quantity of bananas, plantains, and limes, as a part of her cargo, being the first shipment for commercial purposes, of fruit, produced at that place. A bunch of bananas, and of the plantains, and a few of the limes, may be seen at this office, all remarkably fine."

H. P.—ib.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JAN. 8, 1833.

TYRANNY AMONG HORNED CATTLE.

It is a fact of some consequence to be borne in mind by every person who has any thing to do with barnhold economy, that neat stock do not pay any regard to the rights of cattle, but every animal is a tyrant to the extent of its power, and a slave to the amount of its weakness and its fears. The right of the strongest is apt to be exercised by the higher orders, over the more puny and pusillanimous without measure or mercy; and some aristocratic animals appear to take as great delight in worrying and tormenting their inferiors as if they belonged to the classes of bipeds called emperors, kings, conquerors, &c. On this and other accounts it is important to give your stock plenty of room for feeding ground, racks, troughs, &c. The size of a barn yard should be large in proportion to the stock kept in it. A small yard gives the stronger animals a greater chance to gore and harass the weaker than if there was room for the latter to escape from the assailants.

"The spirit of domination" says an English writer "is so remarkably prevalent among horned cattle that I have a hundred times observed the master beasts running from crib to crib, and absolutely neglecting their own provender for the sake of driving the inferior from theirs. This is, much oftener than is suspected, the chief reason of that difference in a lot of beasts after a winter's keep. It is likewise a very common, and very shameful sight, in a dairy of cows to see several of them gored and wounded in a dozen places, merely from inattention of the owner, and the neglect of clipping the horns of those that butt. The weaker animals should be kept apart; and in crib feeding in the yard, it is a good method to tie up the master beasts at their meals."

Dr. Deane observed "There should be more yards than one to a barn, where divers sorts of cattle are kept. The sheep should have a yard by themselves at least; and the young stock another—that they may be wholly confined to such fodder as the farmer can afford them."

Foddering Cattle. It is important to make the most of your materials for foddering. Corn butts and straw, which are often thrown away, with a little pains may be made useful as fodder, by being cut with a straw cutter, mixed with a little cut hay or corn, and the mixture sprinkled with a pretty strong solution of salt and water. "There is a remarkable difference" (according to Lisle, an English writer on husbandry) "in cattle's eating straw when fresh thrashed, and when it has been thrashed several days, especially if the straw is indifferent fodder."

Breeds of Domestic Animals. "Mr. Bakewell of the Dishley farm in England has rendered himself famous by his breed of cattle. His principal aim is to gain the best, whether sheep or cow, which will weigh the most in the most valuable joints; and the same time that he gains the shape that is of the greatest value in the smallest compass, he finds by experience that he gains a breed much hardier and easier fed than others. In his breed of cattle, his maxim is, the smaller the bone the truer will be the make of the beast; the quicker it will fatten, and the weight will have a larger proportion of valuable meat."

The shape which should be the criterion of an ox, bull, sheep or cow, is that of a hoghead or barrel, truly circular, with small, and as short legs, as possible; upon this plain principle that the value lies in the body, and not in the legs. All breeds, whose backs rise in a ridge, are bad.

By proper management Mr. Bakewell brings up his cattle to amazing gentleness; his bulls stand still in the field to be handled; they are driven from field to field with a small switch. His cattle are always fat, and this, he insists is owing to their breed.

The small quantity, and inferior quality of food that will keep a beast, which is properly well made, in good order, is surprising. Such an animal will grow fat in a pasture which would starve one with great bones and ill made.

Mr. Bakewell is equally curious in the breed of his sheep. The bodies of his rams and ewes are as true barrels as can be seen; round broad backs and legs, not more than six inches long. An unusual proof of their kindly fattening is their feeling quite fat between the fore legs upon the ribs, where the common kinds never carry any fat.

He finds that hardly any land is too bad for a good breed of cattle, and hardly any good enough to make a bad breed profitable.

Mr. Bakewell was remarkably attentive to the business of watering his stock. All his horned cattle were tied up in open or other sheds during the winter, and fed, according to their kind, on straw, turnips or hay. Young cattle, which require to be kept in a thriving state, and fattening ones, were fed on roots. His farm consisted of 440 acres; 110 under the plough, and the rest in grass. He kept 60 horses, 400 large sheep, 150 horned cattle, and had generally 15 acres of wheat, and 25 of other Spring grain."

The *Encyclopedia Britannica*, under the article Agriculture, gives the following notices of some of the improvements above adverted to:

"By Bakewell's skilful selection at first, and constant care afterwards to breed from the best animals, he at last obtained a variety of sheep, which for early maturity, and the property of returning a great produce of mutton for the food they consume, as well as for the small proportion which the weight of the offal bears to that of the four quarters, are altogether unequalled either in this or any other country. The Dishley or New Leicester sheep and their crosses, are now spread over the principal corn districts of Britain; and from their quiet, domesticated habits, are probably still the most profitable of all the varieties of sheep, on farms where the rearing and fattening of live stock are combined with the best courses of tillage crops.

"The practice of Bakewell and his followers furnishes an instance of the benefits of a division of labor, in a department of business where it was little to be expected. Their male stock was let out every year to breeders from all parts of England; and thus, by judiciously crossing the old races, all the valuable properties of the Dishley variety descended after three or four generations to their posterity. By no other means could this new breed have spread so rapidly, nor have been made to accommodate itself so easily to a change of climate and pasture. Another recommendation of this plan was, that the ram-hirer had a choice among a number of males, of somewhat different

properties, and in a more or less advanced stage of improvement, from which it was his business to select such as suited his particular object. These were reared by experienced men, who gave their principal attention to this branch alone; and having the best females as well as males, they were able to furnish the necessary supply of young males in the greatest variety to those farmers whose time was occupied by other pursuits. The prices at which Bakewell's rams were hired, appear enormous. In 1789 he received twelve hundred guineas for the hire of three brought at one birth; two thousand for seven, and for his whole letting, at least three thousand guineas."

GAMA GRASS SEED.

EXTRACT from a letter from Mr. M. Bartlett, Editor of the Southern Planter, to the Proprietor of the New England Farmer.

"Enclosed I send you a few seeds of the Gama Grass which at this time is exciting a good deal of interest in the southern states, as you will perceive by the papers. It has but lately been brought into notice in this State, and experiments with it have not been fully tested. It promises, however, the most beneficial results. It is perfectly naturalized to our climate, being found wild in almost all parts of the state; yields abundantly, and the roots withstand our severest winters. But it may be no object in your climate and section only as an article of curiosity. It can never, probably, compete with your fine grasses and clovers."

Mr. Bartlett then requests some exchanges of seeds, lucerne, white mulberry &c. and promises in return to send us seeds and roots. We shall be happy to reciprocate favors of this kind, and are very much obliged to Mr. Bartlett for his kindness. The Gama grass seed which we have received shall be put into the hands of such of our friends as we think will turn it to the best account.

The Editor of the N. Y. Farmer gives the following notices of this grass.

"The seeds are put in drills 18 inches apart, and the plants should be hoed sufficient to prevent the growth of weeds. The first season they spread and cover the whole surface. During the second, they are cut once a month from May or June to October or November. Being a perennial, it will probably continue to produce for several years without renewal. Those who are zealous advocates for the introduction of this grass into southern husbandry in particular, say that it will produce 70 to 80 tons of green hay or 20 to 30 of cured hay to the acre.

Some botanists describe four species of *Trip-sacum*, but that called Gama Grass is supposed to be the *T. monostachyon*; others enumerate only three, and, in the opinion of some writers, two of these are identical. Professor Eaton describes only two, considering the *T. monostachyon* a variety of the *T. dactyloides*.

BLACK TONGUE.

The following Recipe was furnished us by a gentleman who has tried and proved its efficacy.

Take of Saltpetre, Copperas, Alum and Loaf Sugar, $\frac{1}{2}$ oz. of each, and 1 pint of Brandy. Simmer them together, so that the ingredients be well mixed, and apply it as a wash. The mixture should be heated over a slow fire, as it is very inflammable, and should it boil over it would burn like gunpowder.

ITEMS OF INTELLIGENCE.

The London Times states, that the British Ministry have in contemplation an important plan for the relief and benefit of the people. They intend to form an establishment in every parish, under the guaranty of Government, for the granting of annuities. A person paying 9d a week from the age of 15 is to be entitled after the completion of his 60th year, to an annuity of £20 for life; and if he prefers to pay 18d a week, to an annuity of the same amount from the age of 35. Persons paying £671 10s. once, are to have considerable advantages held out to them, and the annuity of £20 will be allowed at a stated period. The poor who may become subscribers, are to receive the benefit now enjoyed by the proprietors of those institutions in which annuities are granted. If at any period a subscriber chooses to withdraw what he has thus deposited he is at liberty to do so, but will have no claim to interest, though from the time when the annuity becomes payable, the privilege of withdrawing the principal is to cease.

A train of one hundred and forty cars, containing upwards of 3600 barrels of flour passed over the Baltimore Rail Road, destined for that city.

A letter from the Pacific, to a house in New York, received via Panama, states that Arica and Tacna were nearly destroyed by an earthquake on the 18th of Sept.

A Deer of the largest size was lately killed at Freetown Furnace, the first that has been seen there for a number of years—and dearly he paid for his temerity.

A farm one mile from Norristown, (Pennsylvania) of 155 acres, was sold on the 7th ult. for \$252 per acre. The purchaser has since refused \$5000 for his bargain. Norristown is a small village, situated on the Schuylkill river, 17 miles from Philadelphia.—*Poughkeepsie Jour.*

A shocking accident occurred in Clay, N.Y. last Tuesday night. Two young ladies, Miss Ricord and Miss Hufftailing, went to bed in perfect health and were found dead in the morning by their parents in consequence of a Charcoal fire in a tight room.

TO BE LET

THE whole, or part of a Farm, in the vicinity of Boston, containing about 95 acres of good land, with a convenient House, Barn, and out houses—of which possession may be had on the 1st of April next—Provided application is made by a capable, steady and industrious man, of good moral character, and who has been educated in the business of Farming, and who will produce a good recommendation of such qualifications—and none other need apply.

For further information, enquire of the proprietor and publisher of the New-England Farmer, at his Office, Nos. 51 & 52, North Market Street, Boston.

100 BUSHELS TIMOTHY SEED,

GROWTH of 1833, just received at G. C. BARRETT'S Seed Store, Nos. 51 & 52 North Market Street.

SOUTHERN CLOVER,

GROWTH of 1833, just received by G. C. BARRETT.

FINE EARLY PEAS.

Earliest Dwarf Peas—the earliest variety of Peas, grown from 20 to 24 inches high—consequently require no sticks.

Early Washington Peas; a very productive early variety.

Charlton " Early Golden Hotspur, do.;

Bishop's Early Dwarf, do.; very dwarf and early.

Also—Dwarf Scymetar Peas—A new variety from Scotland; this Pea will be found a great acquisition for a very productive and delicious late sort.

Dwarf Blue Imperial Pea; Knight's Dwarf do.;

Large Dwarf Marrowfat, do.; &c. &c.

All the above were raised expressly for the NEW ENGLAND SEED STORE, Nos. 51 & 52, North Market Street.

MANUAL OF THE MULBERRY.

Just published, the second edition of Cobb's Manual, containing information respecting the growth of the *Mulberry Tree*, with suitable directions for the culture of SILK, in three parts. This edition is an improvement. Price 50 cents.

For sale, by GEO. C. BARRETT, N. E. Farmer Office.

CATALOGUE FOR 1834.

Just published for distribution gratis a Catalogue of GARDEN & GRASS SEEDS, of the growth of 1833, raised expressly for, and warranted of first quality by, GEO. C. BARRETT, New-England Seed Store, Boston.

SEED BARLEY.

Seed Barley for sale, at G. C. BARRETT'S Seed Store.

FOR SALE.

A Cow and Calf of good Breed and good for Milk, by S. POND, of Cambridgeport. Jan 8.

NOTICE.

A capable, faithful and industrious young married man who should be disposed to take a Farm (upon fair terms) consisting of about 90 acres of good tillage and pasture land, within eight miles of Boston, and within half a mile of a growing neighborhood, where he would find a profitable, ready and sure market for a regular supply of vegetables—which advantages, with that of supplying milk in the City, would ensure him a lucrative and encouraging support—may hear of such an opportunity, on a personal application to the publisher and proprietor of the New-England Farmer, at the Agricultural Warehouse, Nos. 51 & 52, North Market St., Boston—possession may be had the 1st of April next. Boston, December 13, 1833.

STEAM RICE MILL, AT SOUTH BOSTON.

THE subscriber having purchased the Patent Rice Machines of Messrs. Strong, Moody & Co. of Northampton, with the exclusive privilege of using them in Boston and a large vicinity, has put them in operation at South Boston, near the Free Bridge. It is well known that rice in its rough state, or with its outer hull on, will keep many years, and that after being cleaned, it is subject (particularly in warm weather) to weevil, and other insects, and is usually put in bad casks—he therefore hopes, by having this article always in a fresh state, in casks of different sizes, to meet with a ready sale. The mode of cleaning being entirely different from any other now in use in any other country, the grain is kept quite whole and very clean. It will be put in good casks of usual size, for export; also in barrels and half barrels, and in bags of 100 lbs. each, (which may be returned;) also, ground into fine Flour, in quarter barrels—it will be delivered in any part of the city, for a reasonable charge, and will not be sold in smaller quantities. Also, the fine Bran, or Flour, so called in the Southern States, being the inner coat of the grain, excellent food for horses, cows, hogs, sheep and poultry—and the outer Hull, a prime article for packing glass, crockery, bottles and fruit, and is believed will prove valuable in making Course Paper, will be sold at a low price in large quantities.

This Rice is particularly recommended for whaling ship, and others going long voyages, as from being highly polished and free from dust and flour, and being put into their tight iron bound casks, it will be free from any insects, until exposed to air.

[P] An Order Box is placed in Mr. Roger's Foreign Letter Office in the area of the City Hall, and a sample of the Rice in the several Insurance offices, State str. JOHN PRINCE. Boston, Nov. 16, 1833. if

FRUIT TREES.

ORNAMENTAL TREES. ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 3½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston.

MISCELLANY.

From the Genesee Farmer.

TO COMING EVENINGS.

In summer days I till the ground,
And tug, and toil and get my bread;
No interval can then be found
Between my labor and my bed;
My wife declines to knit by night,
And I to read by candle-light.

But when the south receives the sun,
Beyond the equinoctial line—
When all my summer work is done,
Substantial pleasures then are mine;
Then Jane begins to knit at night,
And I to read by candle-light.

I am content and never sigh,
Nor fly from home some bliss to find;
And Jane is pleased as well as I,
It so completely feasts her mind,
To sit her down to knit by night,
And hear me read by candle-light.

For when I read, she always hears,
And what she hears she tries to scan;
When aught obscure to her appears,
Then I explain it if I can.
O how she loves to knit by night,
And hear me read by candle-light.

But when she drops a stitch and gapes,
Soon gapes again and nods her head,
I close my book, and say "perhaps
'Tis time, my dear, to go to bed—
So knit again to-morrow night,
And hear me read by candle-light."

From the London Quarterly Review.

FIXED STARS.

We are as yet, and doubtless ever shall be, without the means of numbering those tenants of the firmament. Every new improvement of the telescope brings within the range of vision countless multitudes which human eye has never seen before. Some stars are double, and even triple; that is to say, they appear to us within a barely distinguishable distance of each other. Upwards of three thousand double stars have been discovered; and it is justly supposed that even this number by no means exhausts the fertility of the Heavens in these twin productions, some of which have been actually observed to move round each other in orbits requiring for their entire completion twelve hundred of our years. Such systems as these give the mind a faint glimmer of eternity.

Astronomers conjecture, not without reason, from the analogies of our own system, that these suns do not revolve round each other, shedding their light in vain, but that each is accompanied by its circle of planets, which being opaque bodies, would of course be forever shrouded from our view by the splendor of their respective orbs of day. This idea leads us to conclude that the stars which are separated from each other by distances at least as great as that of Uranus from our sun—that is to say, some eighteen hundred millions of miles—have also their respective planets, their Mercuries, their Earths, their Jupiters, and Saturns, and are the centres of peculiar systems throughout the whole firmament. If these planets be peopled by intelligent beings, as Earth is, and the other planets of the Solar System are supposed to be, the contemplation in thought of such myriads of globes with their inhabitants, overwhelms the mind.

We have no mode of ascertaining the distance

of any one of the stars from the earth. We have measured the circumference which we describe in our annual journey round the sun; we take the diameter of that circle, and with it form the base of a triangle whose vortex should be at the nearest of those luminous bodies. The angle thus formed, however, at the star, would be unappreciable with the most perfect instrument of human invention. Now an angle of one second of a degree is appreciable; consequently the distance of the nearest fixed star must exceed the radius of a circle, one second of whose circumference measures one hundred and ninety millions of miles; that is, it must exceed two hundred thousand times the diameter of the earth's orbit. If the dove that returned no more to Noah, had been commissioned to bear with her utmost speed, an olive branch to the least remote of the spheres, she would therefore still be on her journey: after towering for forty centuries through the heights of space; she would not at this moment have reached the middle of her destined way.

No Machinery has yet been invented, indeed it seems at present impossible that we should ever devise any means, by which we might estimate the magnitude of even the least of the stars, since we never behold their distances. We become sensible of their existence by rays of light, which must have taken, in some instances, probably a thousand years to reach our globe, although light is known to travel at the rate of one hundred and ninety-two thousand miles in a second. Sirius, the brightest, because perhaps the nearest to us of those luminaries, is conjectured by Dr. Wollaston to give as much light as fourteen suns, each as large as ours. An individual gazing through an instrument from a planet of Sirius to our sun, might suppose that he could cover our entire system with a spider's thread. He would set down the sun in his map as a fixed star, but to his eye it would present no variation, as the largest of our planets would not intercept much more than a hundredth part of the sun's surface, and could not therefore produce any loss of light of which he could take any estimate. For him this globe of ours, immense as to our finite faculties it seems to be, would have no existence. It would find not even a point's place on his chart, and if it were blotted out of space tomorrow, it would never be missed by any of the probably fifty worlds that are bathed in the floods of light that Sirius pours forth. Whose eye is it that watches over our sphere? Whose is the ever-extended arm that maintains it?

CASTOR OIL FOR LAMPS.

In the thirteenth volume of the American Farmer, page 207, we mentioned a discovery by Mr. Isaac Smith, of Eastville, Northampton Co. (Va.) which enabled him to render castor oil equal to the best sperm for burning in lamps. We mentioned, also, that it was Mr. Smith's intention to take out a patent for this valuable improvement. This, however, he has not done; and his son, Mr. Francis H. Smith of this city, called at our office a day or two ago, and gave us permission to make known, for the benefit of the public, his father's method of preparing the oil, which is merely mixing with it spirits of turpentine, with which it readily combines, in the proportion of one of the latter to four of the oil. The simplicity of this manner of preparing it, enhances the value of the commodity very considerably.

As to the excellence of the composition, for the purpose of lighting rooms, there can be but one opinion by all who have tried it.

It is at least equal to the best sperm we ever saw in its quality for combustion, and in its appearance decidedly superior. We are now writing by a lamp filled with it, and a finer light we never saw. The lamp has been burning three hours, and there is not the slightest appearance of crust; on the wick and on extinguishing the flame, there is no fire remaining in the wick as is generally the case with sperm oil, except of the very best quality—indeed, in the extinguishment and in the relighting of a lamp of this oil, there is a strong similarity to that of a gas light. Mr. F. H. Smith has used this mixture in his house these five years, and prefers it decidedly to the best sperm. It emits, he says, a clearer and more powerful light, and burns somewhat longer than sperm, and never congeals in the coldest weather. The present relative prices of castor and sperm oil, offer no inducement to those on the sea-board to substitute the former for the latter; but to our brethren of the West, the subject promises to be of much importance, as rendering them still further independent of foreign supplies for the necessities and comforts of life. The compound is likewise much cheaper to them, inasmuch as a double freight is saved—that on sperm oil from the sea-board and on castor oil, the abundant product of their fields, to a distant market.—*Am. Far.*

AMERICAN HEARTH RUGS.

JUST received at 414 Washington street, a fresh supply of Hearth Rugs, from the Tariffville Factory, manufactured expressly for the subscriber—they are superior in beauty and fabric to any imported. E. S. BREWER.

N. B. E. S. B. will receive orders to manufacture Rugs to match any carpet. iscopJ1 nov 23

CASH STORE.

THE subscriber offers for sale a large stock of English and American Goods at reduced prices, among which are

Bales Black Bombazette of good quality, at 12½ cts. per yard.
" Green
" Blue and Brown Camblets of good quality, at 12½ cents.
" Scotch Plaids,
" English, Sup. & fine 6-4 Merino from 3s. to 8s. per yard.
" French " " " " " \$1 to \$2 " "

In addition to the above, the subscriber offers a more extensive stock of Woollen, Linen and Cotton Goods, than can be had at any other Store in the City, at prices proportionably low to those above named.

E. S. BREWER, 414 Washington Street.

THE NEW ENGLAND FARMER.

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[F] No paper will be sent to a distance without payment being made in advance.

AGENTS.

New York—G. THORBURN & SONS, 67 Liberty-street.
Albany—Wm. THORBURN, 347 Market-street.
Philadelphia—D. & C. LANDRETH, 85 Chestnut-street.
Baltimore—J. I. HITCHCOCK, Publisher of American Farmer.
Cincinnati—S. C. PARKHURST, 23 Lower Market-street.

THE HON. JUDGE STRONG'S ADDRESS,
Delivered before the Worcester Agr. Society, Oct. 9th, 1833.

[Published in the N. E. Farmer at the request of the Trustees.]

(CONTINUED FROM PAGE 215.)

AGRICULTURE, then, in its improved state, is to cultivate the earth so as to obtain the greatest number and quantity of useful products. To do this successfully, something more than mere labor is necessary. There should be judgment, experience, science. The crops of the farmer are the result of a process of nature called vegetation. A vegetable derives its nourishment from the earth, water, air, heat and light. It is only a portion of the earth, however, which affords nourishment to plants. It is supposed by geologists that the greater part of what is called the crust of the earth, that portion which is commonly called dirt or earth, is produced entirely by the pulverization of different kinds of rocks. This substance of itself, and unmixed with any other substance, the result of the decomposition of any one species of rock alone, will not afford any nourishment to plants. It is only by means of what is called vegetable mould, the production of the continued decay of vegetable matter, and the mixture of this vegetable mould with the different species of pulverized rocks, or the different species of pulverized rocks with each other, that any food for plants is obtained. This vegetable mould, of so much importance in agriculture, and so greatly increasing the fertility of land in new countries covered with forests, is of considerable depth. The leaves have been falling from the trees for ages; and these, with other vegetables which may grow upon the surface, have been constantly decaying and annually adding to the depth of that rich vegetable mould which is the means of the future farmer's abundant crops. This is the reason that the lands of new countries covered with dense forests, when first cleared are always fertile. After this vegetable mould is exhausted, as it is with respect to most lands in this vicinity, the skill of the farmer consists principally in procuring a substitute, by means of the various kinds of manure. The manure which is procured from animals, will furnish but a small portion of what may be necessary to the proper and skillful cultivation of a farm. This manure from animals should not be used in its raw state, or in its full strength; but should be thoroughly mixed with other substances in the formation of the various kinds of compost manure, so as greatly to increase the quantity, and also improve the quality. In making the most, then, of the manure from animals, and the various substances within his reach, to increase to the greatest practicable extent this very important article of compost manure, the farmer will need judgment, experience, and to a certain extent science. Great advantages may also be gained by the judicious, skillful and scientific farmer, by a mixture of the different soils upon his farm; and this to a certain extent will answer the purpose of manure. Some portions of his farm are comparatively barren by reason of an excess of one kind of soil and a deficiency of another. In other portions, the comparative quantities of the same soils are the reverse; and, by correcting these inequalities and restoring the proper proportions, the productiveness and com-

parative fertility of both portions will be greatly increased. To do this understandingly and successfully, the farmer should know where these inequalities exist and what are the proper proportions to afford the necessary corrective. Here, then, will be the most abundant scope for the judgment, experience and science, even, of the farmer. Much, also, of the success of the farmer will depend upon his knowledge of the adaptation of the different portions of his premises to different crops; to what extent particular crops will exhaust the vegetative powers of the soil, and a judicious rotation of crops. By proper knowledge and skill in these particulars the farmer will be enabled to keep up the vegetative powers of the soil for a much longer period; and derive greater advantages from this power, while it lasts. I trust I have shewn enough to make it clearly appear that it is not labor, merely, simple industry, which can make a good farmer. There must be a mind in active operation, judgment, skill, experience, science.

Having thus treated briefly of the importance of agriculture, and stated some of the requisite qualifications of a good farmer, I will proceed to consider the importance of agricultural societies. Are agricultural societies useful? Are sufficient benefits derived from them to individuals and the community, to compensate for all the trouble and expense of their operations? Might not the farmer, by staying at home without the aid of any society, by proper observation, reading and inquiry, make the same or greater improvement? In answer to these interrogatories, I will endeavor to show that agricultural societies are not only useful but highly useful, by two different modes of proof. First, from their nature and tendency; and secondly, by the effects actually produced by them. And first, as to their nature and tendency: The farmers, from necessity, are scattered over the country, at some distance from each other; and though they have intercourse with those in the immediate vicinity and in the same town, and sometimes to a greater distance; and by conversation with them, and their own observation, may make some improvements in the mode of managing their farms; yet the field of observation and knowledge is necessarily narrow when compared with the whole extent of a county. An improvement in raising some particular product may be known and practised in one section of the county for years, and the knowledge of it travel but a short distance from the place where it originated. But if there is a meeting of farmers for the special purpose of improvement in agriculture, each year, from every part of the county, this improvement will be the subject of conversation, and the knowledge of it will rapidly spread into every part of the county. The great utility of these societies, however, and of all associations of men to accomplish important objects, is to excite a spirit of emulation; of commendable rivalry; to excite in the farmer (which is frequently necessary to be excited) ambition and pride of character, as a farmer. This latter object cannot fail to be effected by a society having annual meetings. The mere circumstance of a great number of men meeting together to promote an important object, has this effect upon an ingenu-

ous and well regulated mind. The *esprit du corps*, the spirit of the association is produced; and no man whose mind is susceptible of pride and ambition, and who has any claims to the character of a respectable farmer, can go home from such a meeting of farmers without forming resolutions of improvement. He sees the subject in a new light. It assumes an importance in his eyes which it never did before. He has been accustomed to consider himself as a kind of isolated being upon his farm, necessary to attend to it to be sure, to furnish subsistence to himself and family, but of no farther importance. He now sees himself to be a member of a numerous and respectable association, all engaged heart and hand to promote improvements in farming. These improvements themselves appear of new and additional importance in his eyes. He feels elevated in his own opinion; his relative importance is increased; and he has new views altogether, not only of farming, but of the comparative respectability of the employment. Is all this nothing? Is it no point gained to inspire the farmer with such views and feelings as these? Those who are acquainted with human nature; those who know the proper means of directing the human character, and the secret of developing the powers and faculties of men, in such a manner as to operate with the greatest intensity to the accomplishment of great results, will answer these interrogatories in the negative. Yes, it is almost every thing in the accomplishment of great objects of improvement to collect men together and bind them in an association for that purpose. They see and hear and know new things; and see and hear and learn them in such a manner as not to forget them; in such a manner as to make an indelible impression; and to have a practical influence upon their conduct. The farmer who, when at home on his own farm, and when comparing it with his neighbor's thinks he does pretty well, and enjoys that self-complacency which is so pleasing to the mind, and which is so readily indulged, without examining with too nice a scrutiny his claims to participate in a feeling which affords him so much pleasure,—when he comes to see and hear and learn what others have done, how much greater improvement they have made, and how far short he falls of what may be done, his self complacency vanishes. He feels a momentary sense of mortification; and, then, with that elasticity of mind which appropriately belongs to an enterprising and ambitious man, in the next moment he resolves, that for the future no one shall go beyond him in any practical improvements which industry and enterprise can accomplish. When at home he thinks he has good horses, good cows, good oxen, good sheep and good swine. When he comes here and sees the animals of these various descriptions which you show him, he finds that his home ideas of excellence were quite limited, and goes back with the determination that, as soon as it is practicable, the stock upon his farm shall bear a closer resemblance to those which he sees here. A well regulated agricultural society not only furnishes information to its members at their annual meetings, but is the means of collecting and distributing knowledge upon the subject of agriculture through-

out the whole community. The publications which are from time to time made by these societies, and distributed among the members and others,—as also the periodicals devoted to the improvement of agriculture which spring up, which are brought into existence and supported by the emulation, zeal and ardor for improvement, which is raised and continued by the operations of these societies,—diffuse information upon this important subject extensively, and greatly promote the interests of agriculture. Every new discovery, every successful experiment, every useful hint or suggestion from any quarter, every valuable essay found in domestic or foreign journals are here collected, and at stated periods laid before the farmer for his guidance and instruction. The spirited farmer, seeing the details of successful experiments made by others is encouraged to make experiments himself; and, when successful, or if they afford useful information, these also are published for the benefit of others. The nature and tendency, therefore, of these associations, if managed as they ought to be, if carried on with judgment and spirit, is to excite emulation in the members and others, and to diffuse information upon the subject over the whole community, and cannot fail to have an extensively beneficial effect. Such I believe to be their usual operation.

I was also to show the utility of agricultural societies from the effects actually produced by them. And, here, I can only direct your attention to the various improvements in agriculture in this county, which it seems to me are in a great measure, if not entirely owing to the existence and efforts of this society. I would inquire of the members of this society, those of them who are practical agriculturists, whether they do not perceive its beneficial effects upon their own farms, upon the farms of their neighbors, and throughout the county generally, so far as their observation extends. Swamps are drained, old worn out pastures ploughed up, enriched by tillage a few years, and laid down anew—bushes mowed in pastures—belts of useless weeds and brush around tillage fields are less frequent—more stone walls made—cobble stones removed from tillage grounds—more pains taken to cultivate the rich upland grasses, and substitute them for the much less valuable water grasses; the quantity increased and quality improved of almost every article of tillage; in some instances new and useful products have been introduced; valuable fruit trees increased in number, and new varieties introduced; great improvement made in farming tools; the stock of the various animals kept by the farmer unquestionably improved; great advantages gained by a judicious rotation of crops; manure, that great desideratum of agriculture in cultivating our lands, where the original, vegetable, virgin mould, has long since been exhausted, has been increased in quantity and improved in quality; and various modes of making compost manure have been adopted; important improvements made in dairying and the feeding and fattening of cattle; farm houses and other buildings improved. In short, it has essentially altered the appearance of your farms, making them more beautiful to the eye, more useful to the owners, increasing the means of your subsistence; and though last, not least, it has diffused abroad a spirit of improvement and ambition, a professional pride, if I may be allowed to apply the expression to the employment of a farmer, which affords a propitious augury, and a sure pledge of still farther and great

improvements.—I will now notice a few considerations which should operate as encouragements, and subjects of congratulation to the New England farmer. That sense of degradation, or disgrace, which in most countries does now attach, and which once did attach to a certain extent in this country to the employment of the practical farmer, to the man who with his own hands labors in the cultivation of the soil, has, here, entirely passed away. The employment has become what it always should have been, respectable. It stands upon the same footing with every other occupation or employment in our happy community. Why should it not be so? What man among us is better entitled to the character of respectable than the industrious, active, enterprising and intelligent yeoman? a man who owns the land on which he lives in fee, to him and his heirs for ever, and is not obliged to pay tribute for the use of it to any one in the shape of rent, service, rent charge, rent rack, or any other rent: who can look around upon his many acres, covered with the various and rich products of agriculture, brought into existence by his own industry, and say, this belongs to me and my children, and my children's children: and will descend from generation to generation, with my name and blood. Another subject of congratulation to the New England farmer is that he is not only free himself, but his laborers and all those about him, are free. I do not mean here to touch the question of the lawfulness of slavery, the natural, moral or political right of one human being to enslave another, a subject which in another portion of the Union occasions considerable excitement; and, even here, some few individuals manifest what I cannot but consider an indiscreet zeal respecting it. It seems to me that we are not authorized to touch the question of private property in slaves. We have entered into the most solemn compact, the Constitution of the United States, that we will not interfere between the master and his slave, or do any thing to impair his right of property therein. But, surely, we may be permitted to congratulate ourselves that we are free from this great moral curse, for such it undoubtedly is to any people, where it is allowed to prevail. Without noticing the cruelties which are said to be practised in the slave holding states; and which, probably, are greatly exaggerated; the very position of the master with respect to his slave is calculated to impair his virtue, and bring out in bold relief, all the evil propensities of his nature. Power over the life or liberty of a human being is not favorable to virtue. The distinction between the laboring class, and other classes not only by their being of a different color, but also in a degraded condition, effectually precludes the superior class from all labor; and necessarily prevents them to a great extent from that activity both of body and mind, so essential to a healthy condition of both. The slave labors by compulsion. He has no interest in the success or produce of his labor. Such a subsistence as his master may think it his interest to furnish him to keep him in a vigorous and healthful state, to enable him to perform the greatest quantity of labor, is secure to him. This he will receive whether he labors little or much. The slave is interested, therefore, to do as little as possible; and generally nothing but the vigilant eye of the overseer, and the occasional use of the whip, will enable the master to procure from his slave even a moderate quantity of labor. This, however, is not the greatest evil of slavery. That slave la-

bor is dearer than free labor, that it exposes the master to many troubles and inconveniences, that it creates a distinction between different classes of human beings repugnant to the best feelings of the human heart, that it exposes the owner at times to serious alarm and apprehension, and disturbs the peace and quiet of families—these are evils. But the greatest evil of slavery is the moral effect upon both classes, the masters and the slaves. As I have before said, power over the liberty and life of a human being is not favorable to virtue. The tendency is to nourish pride, cruelty, hardheartedness, and to diminish and sink into the shade all the mild, affectionate, and sympathetic feelings of our nature. The very position of master and slave creates a diversity of interest, and, to a certain extent, an hostility of feelings. Though there are many commendable and honorable exceptions in both classes, the necessary tendency of this unnatural state, and the actual operation upon the greater number of those who are exposed to its influence are such as I have stated. How different is your situation? Free yourselves, you have none but freemen around you. Their labor is voluntary. You have no right, nor is it necessary to resort to any mode of coercion. They labor cheerfully. It is their interest so to do. Their interest and yours are identical. Well, then, may you congratulate yourselves that you are free from this great evil—this increasing, and it is too much to be feared this irremediable evil of slavery.

I have already hinted at the tenure by which you hold your farms; and this also should be encouragement and subject of congratulation. That tenure is usually a fee simple, an absolute estate. You have uncontrolled dominion over your lands while living, and when they can no longer subserve to your necessities and comfort, you dispose of them as you please. No rents, no tithes, no entailments. No bums-bailiff, or any other bailiff to seize your cattle or valuable products to pay the last quarter's rent. No clergyman to enter your fields, when your rich products are ready to be gathered into your barns, to require you to set out and deliver to him for his exclusive use, one full tenth of those products. No large tracts entailed upon particular families to descend entire, undivided, from generation to generation, the course of which cannot be altered whatever may be the necessities of the community. With what pride, then, may you walk over your fields, covered with the products of voluntary industry, and reflect that you hold them discharged of those onerous burthens, those numerous and vexatious claims, those odious restrictions, which in other countries reduce the cultivator of the soil to a miserable peasant elevated in condition and character but little above the slave. [To be continued.]

COMMUNICATIONS.

For the New England Farmer.

GROUND RICE.

MR. FESSENDEN—Your having published, a short time since in the N. E. Farmer some receipts for the using of *ground Rice*, a friend in the country, who has long been known for preparing nice dishes for her friends, has sent me some for both whole and ground Rice—and as the mill now established at South Boston produces both these articles of very superior quality, and always to be had *fresh cleaned* and ground—it is remarked by all our *Cooks* that this Rice is so very clean, as not

to require any picking or washing, and saves them much time. Your friend, &c. R.

Rice Cake.—Mix ten ounces of ground rice, three ounces of flour, eight oz. of powdered sugar; then sift these articles by degrees into 8 yolks and 6 whites of eggs, and the grated peel of one lemon. Mix the whole well together in a tin-stewpan over a very slow fire with a whisk, then put it immediately into the oven in the same pan, and bake forty minutes.

Another Rice Cake.—Beat 12 yolks and 6 whites of eggs, with the peels of 2 lemons grated. Mix 1 pound of rice flour, eight ounces of flour, and 1 pound of sifted sugar. Then heat it well with the eggs by degrees for an hour, with a spoon. Butter a pan thoroughly and put it in; a gentle oven, an hour and a half will bake it.

Rice Caudle.—Soak some whole rice in water an hour, strain it, and put two spoonfuls of the rice into a pint and a quarter of milk; and simmer, till it will pulp through a sieve. Then put the pulp and milk into a saucepan, with a bruised clove, and a little white sugar. Simmer 10 minutes; if too thick, add a spoonful or two of milk, and serve with thin toast.

Rice Milk.—Is made by washing the whole rice very nicely, and simmering over a slow fire, with a considerable quantity of milk, till very soft; then flavored with lemon, spice and sugar.

Ground Rice Milk. Boil 1 spoonful of ground rice, rubbed down smooth with three half pints of milk; a bit of lemon-peel, cinnamon, and nutmeg. Sweeten when nearly done.

Rice Paste.—Boil a quarter of a pound of ground rice, in the smallest quantity of water; strain from it all the moisture, as well as you can; beat it in a mortar, with half an ounce of butter, and one egg, well beaten. It will make an excellent paste for Tarts, &c.

Small Rice Puddings.—Wash two large spoonfuls of rice, and simmer it with half a pint of milk till thick; then put with it, the size of an egg of butter, and near half a pint of thick cream, and give it one boil. When cool, mix four yolks, and two whites of eggs well beaten; sweeten to taste and add nutmeg, grated lemon peel, and a little powdered cinnamon. Butter little cups, and fill three parts full, putting at the bottom some candied orange or citron. Bake three quarters of an hour in a slow oven. Serve the moment before to be eaten, with sweet sauce.

Plain Rice Pudding.—Wash and pick some rice; throw among it some alspice finely powdered, but not much; tie the rice in a cloth, and leave plenty of room for it to swell. Boil it in a quantity of water for an hour or two; when done, eat it with butter and sugar, or milk. Put in lemon peel if you choose.

Rice Pudding with Fruit.—Swell the rice with a very little milk over the fire, then mix fruit of any kind with it, currants, gooseberries scalded, pared and quartered apples, raisins, or black currants, with one egg in the rice to bind it. Boil well, and serve with butter and sugar. If apples are used, it is better to enclose them in the rice, as with paste. This makes a very delicious pudding.

A Dutch Rice Pudding.—Soak four ounces of rice, in warm water half an hour, drain the water from it, and throw it into a stewpan, with half a pint of milk, a stick of cinnamon, and simmer it till tender. When cold, add four whole eggs well beaten, two oz. of butter, melted in a teacupful of

cream, 3 oz. of sugar, a quarter of a nutmeg, and some lemon peel. Put a light puff paste into a mould or dish, and bake in a quick oven.

A rich Rice Pudding.—Boil half a pound of rice in water with a little salt, till quite tender, drain it dry. Mix it with the yolks and whites of four eggs, a quarter of a pint of cream, with two ounces of butter melted into it, four ounces of beef suet or marrow, finely spread, three quarters of a pound of currants, two spoonfuls of brandy, one of peach water or nutmeg and lemon peel, when well mixed, put a paste round the edge, and fill the dish; slices of candied orange, lemon or citron, if approved. Bake in a moderate oven.

Savory Rice.—Wash and pick some rice, stew it very gently in a small quantity of veal, or rich mutton broth, with an onion, a blade of mace, pepper and salt, when swelled, but not boiled to mash, dry it on the shallow end of a sieve before the fire, and either serve it dry, or put it in the middle of a dish, and pour the gravy round, having heated it.

CHINESE MULBERRY.

To the Editor of the N. England Farmer,

SIR:—The question proposed in your paper concerning the Chinese Mulberry, I consider of great importance to the people of New-England. Should we become unsuccessful in the first attempts to cultivate the trees from which silk is to be made, the whole business must soon fail with us. Those now engaged in the enterprise must be disappointed, and many will sustain loss. The community owe you thanks and generous patronage for calling their attention to this subject.

The article quoted from Judge Buel states that he had two plants of Chinese Mulberry in his nursery, both of which grew vigorously, but were killed by the winter, root and branch. This he mentions as a fact, suggesting a doubt "whether this desired plant will endure our winters." To your request for information upon this subject, I will give the little I possess.

In the spring of 1831, I procured from the nursery of Messrs. Prince and Sons, on Long Island, in New York, two Chinese Mulberry trees. They were of three years growth, if I rightly recollect, and as large as thrifty apple trees of four years growth. Mr. Prince, the senior, assured me that he considered them as hardy plants, they having been exposed to the winter in his nursery. I set them in my garden; they both lived and flourished through the summer. The next spring I found one perfectly alive, but the other apparently killed down to about two feet above the ground. In the summer of 1833, both grew finely, one of them blooming abundantly, and bearing some fruit. They have stood in the open air, unprotected by any special attention. I see no reason to doubt that they will live through this winter. I think I can account for the fall of one of them having been partly winter killed the first year.

One of these trees was set in a light deep loam, some mixed with gravel, and with a full exposure to northerly and northeasterly winds. This continues to be healthy and flourishing. The tree partly winter killed, was set in a deep rich loam, in a situation much less exposed than the other. It grew much more rapidly than the other, of course was more tender, and exposed to be winter-killed. This, in my judgment, explains the whole secret of the power of the winter upon the tree. I should like to know whether the plants lost by Judge Bu-

el were not lost by excessive growth? Will it not be found that all young trees like all young animals may be injured by excessive feeding? My observation convinces me that there can be no doubt of this.

One of the finest orchards, I will venture to say, that ever was seen in any country, was entirely killed to the ground in the severe winter of 1830-31. This orchard was in Billerica, about sixteen miles northwest of Boston. The enterprising farmer who raised it, had obtained the first prize of the Agricultural Society of Middlesex, to crown his success. But by the excessive growth of his beautiful young orchard, his hopes were entirely blasted. Many young thrifty trees, of various kinds, that winter met the same fate. But from such facts we do not infer that our country is unfavorable to the culture of the apple tree.

What is called the Chinese Mulberry, if I mistake not, has been long and successfully cultivated in various parts of Europe. It appears to be the species described by Dandolo. He says, "The best Mulberry leaf of any species, is that which is called the double leaf; it is small, not very succulent, of a dark green color, shining, and contains little water; the tree produces them in great abundance." This species corresponds with that described by Mr. Martleroy, an experienced cultivator of France, as the seedling or wild Mulberry tree. It is probably the same as that which flourishes at Peking in China, although the thermometer descends almost every winter as low as 20 degrees below zero. Much, undoubtedly, depends on the quality of the soil. Authors agree that "the proper soils for the Mulberry tree are dry, sandy, or stony;" that low, rich, and moist lands, never produce nourishing leaves, however vigorous the trees may grow. From all that I have seen, I should not hesitate to plant the Chinese Mulberry, and should consider it as preferable to any other species, if planted on suitable land, and not forced to a rapid growth. If doubt upon the subject remain, one half of the mulberry orchard might be planted with the Chinese, and the other with some other species, or in rows alternately. No measures of good calculation and care should be spared, to secure success to a branch of industry that now has the prospect of reward, in the course of a few years, of even its millions of dollars, adding to the wealth and virtue of the community, and to our common country prosperity.

It was given in evidence to a Committee of the British Parliament in 1821, that two millions of pounds of raw and thrown silks were annually imported into England, giving employment to 40,000 hands in throwing it for the weaver, whose annual wages were 350,000 pounds sterling. In various parts of the manufacture, 80,000 more hands were employed, whose wages amounted to three millions sterling.

Taking the whole business in all its branches, the evidence showed that "including infants and dependants, four hundred thousand mouths would be fed by this manufacture, the amount of which was estimated at ten millions of pounds sterling."

The great advantage to our country in the culture of silk I consider to be in its adaptedness to household industry, giving profitable employment to every one capable of gathering leaves, or turning a crank, or of performing the most delicate process in the use of a most delicate and beautiful article.

R.

Hingham, Jan. 8th, 1834.

For the New England Farmer.

MORUS MULTICAULIS, CHINESE MULBERRY, CONSIDERED AS A HARDY TREE.

Newton, Jan. 8th, 1834.

MR. FESSENDEN—Dear Sir, In the New England Farmer of the 1st of January inst. at page 193, I observe an article which you have republished from the same valuable journal of Nov. 2, 1831, vol. x, page 121. It is a statement of your highly respected correspondent, Judge Buel of Albany, and is as follows: "We had two plants of the Chinese Mulberry in our nursery last season, one budded, the other on its natural roots. They both grew vigorously, and both were killed by the severity of the winter, root and branch." A doubt is thence inferred, whether this desirable plant will endure the winters of northern climates, and a desire is expressed to learn how it has fared in our neighborhood. In reply to this candid statement of Judge Buel, I shall endeavor to dispel any doubts as to final success, which may have arisen on this head, so far as is practicable at this early day.

From my first knowledge of this new plant, I regarded it as one which might prove a most valuable acquisition to our country and climate, throughout the greater part, if not its whole extent, from South to North. For in addition to the fact, that the leaves appear to be preferred by the insects to all others, and the great reduction of labor in gathering the leaves from their extraordinary size, the promptitude with which they are renewed will enable us, by the introduction of this plant, to raise two successive crops of silk in a single season; the soil, the cultivation, the habitations for the successive generations of insects being yet the same—all thus converted to a double use and profit.

Considering the plants as new and highly valuable, and till I introduced them in 1831 as yet untried, I endeavored to multiply them by every possible means, leaving little or nothing to the chances of winter: I forbore risking even a partial loss with the yet young and tender plants of but a single summer's growth. With this view a new plantation, and much more extensive than that of the year preceding, is annually formed, the plants being set so close that by autumn the whole ground shall become occupied with a luxuriant growth of the young plants.

Before winter sets in the whole ground is cleared, and these, together with all seedling plums, cherries, quinces, and white mulberries, &c. are carefully and compactly placed in cellars, their roots buried in soil; or occasionally, the latter for protection, are laid in out of doors compactly, and in a slanting position, their bodies being in part protected by soil. For all of the last named species are liable either to be killed down occasionally to the root by the first winter, or to be utterly destroyed by being thrown out by the frost. Yet in the second winter it is far otherwise; their roots becoming strong and firmly established, the well ripened wood of the second year, and the wood of two years growth, becomes indestructible by any but very extraordinary winters.

The first winter I had opportunity of trying the experiment, was in the most destructive winter of 1831-2, a winter which destroyed so many trees, hitherto deemed hardy, even to the root. My stock of the *Morus Multicaulis* being at that time small, I risked only the experiment of a single one, and that a tender tree, it being only of the growth

of the preceding summer. This I left out in a deep, black, and moist soil, in a northerly and most exposed situation. The young roots only, were protected by a few inches of litter, whilst the top which was wholly exposed, escaped the destruction, except only the ends of the tender twigs. Last winter, I left out a very few of those of but a single year's growth, which were partially exposed. And although I have never lost a single *Morus Multicaulis* by winter, I cannot yet from my own experience alone, speak so decisively at this time as I trust I shall be enabled to do at no very distant day. I have left during the present winter, a few plants of but a single summer's growth, without any kind of protection whatever, and intend another winter to make trial of them on a more extensive scale.

At the Messrs. Prince, on Long Island, we are informed they sustained the rigors of this same winter of 1831-2 uninjured. And Madame Parmentier has assured us that all her *Morus Multicaulis* had sustained the rigors of the last seven winters on Long Island, uninjured and unprotected. During the last summer, I saw at Capt. Chandler's in Lexington, and in an exposed situation, young plants in a state of the most vigorous vegetation, which had endured unprotected the severity of the winter of 1831-2.

I have indeed sanguine expectations that the *Morus Multicaulis* may prove as hardy in our northern climate as the Peach which was originally from Persia, and the Cherry, when once their roots have become established. Its vegetation is rapid and luxuriant, and prolonged to a later period in autumn than most other trees, or till the tender and yet vegetating tips of the twigs are checked by frost. The ravages of the destructive winter of 1831-2 seem to have been principally confined to particular soils. The trees on the dry soils of certain plains and moist low grounds, appear to have suffered very considerably more than on the exposed hills. Even full grown and hardy trees of the Peach, the Pear, and the Apple were, in certain situations, unable to resist the effects of a winter so uncommon and extraordinary.

There is one particular in the statement of Judge Buel, which must not escape our notice. We have no reason to infer from his statement as above quoted, that the *Morus Multicaulis* is not equally as hardy as the *White Mulberry*; since the stock and root of the common *White Mulberry* on which the *Morus Multicaulis* must have been budded, was killed too—a stock and root of three years of age, which we know to be hardy.

In the case above referred to, we must look to other causes than the severity of winter—to some peculiarity of situation or soil. We are justified in this conclusion by a previous communication of the same distinguished philanthropist, wherein he has informed us of a more extensive destruction of other trees, which are deemed equally as hardy as the *Common White Mulberry*. The following are his words—"The past winter has been dreadful to our Cherries, Plums and Pears. We probably lost five thousand trees in our nursery alone." * * * See the "Extract of a letter from Judge Buel to a gentleman in this vicinity."—New England Farmer for August 7, 1829; Vol. VIII, No. 3, P. 28.

From your friend and most obed't serv't,

WILLIAM KENRICK.

N. B. Since the above was written, I have received a letter in answer to one I had written, from J. H. Cobb, Esq. of Dedham, containing

some other particulars than those which are inserted in the last edition of 1833 of his valuable "Manual on the Mulberry tree and the culture of Silk." The following are extracts from his letter, dated Jan. 4, 1834.

"Dear Sir, I received yours of the 2d inst. requesting me to relate my experience as to the hardihood of the new species of mulberry tree, *Morus Multicaulis*: I can hardly say I have had a fair trial of it as yet. Such is the demand for the cuttings that I have been obliged to cut mine down mostly. I have left several exposed this winter in order to try a further experiment. I have no doubt that they will succeed in our northern climate, but for the first two or three years they may require protection; after that they will not need it. The tips will always be lost, as you know they always are of the common *White Mulberry*, when young; but that we shall be able to rear it here is decided beyond a question.

"Your respectfully, &c. J. H. COBB."

For the New England Farmer.

MILCH COWS.

Pittsfield, Mass. 4th January, 1834.

Dear Sir,—In your paper of the 1st instant, is an article under the above head, taken from the *American Farmer*, who answers the question, "what breed of cattle is best for the dairy?" by recommending half blood Durham Shorthorns. He may be correct, for aught I can say; but you may judge, from the following account of three cows of *Native American Stock*, entirely free as I believe, from admixture with any of the foreign stocks, so much recommended.

I have made from these three cows between the 1st of January 1833, and the 1st of January instant, 535 lbs of butter. One of the cows calved in March last, another in May, and a third in July. They have been fed *exclusively*, on grass in summer, and hay in winter, with the exception of a few pumpkins in the fall. My family consists of ten persons, and we use cream almost profusely in June and July; during the season of the smaller fruits, which I raise in great quantities, we consume at least the cream of one cow. The greatest quantity of butter made in one month, was in September, when it amounted to 107 lbs. The cows are all of them large, one very large, perhaps the largest in the county. She calved in March, and upon the dry food of that season even made 48 3-4 lbs butter in four weeks. My pastures in summer are very fine, and I keep them so by sowing them every spring with *unleached* ashes, 15 bushels to the acre, which throws out a profusion of white clover. The soil is dry and gravelly. The extent of my pasturage is 6 acres divided into three lots, into which the cows are driven to feed alternately, and these acres afford an abundant supply until the first of September, when I let them in upon the rowen of my mowing lot. Besides, I have about half an acre of lucerne and tall meadow oat grass, which I cut and give them in the spring before they are turned into the pasture, and which, for the last two years, has afforded them an abundant supply of food for 12 days, besides allowing the pasturage to be well grown for longer use. I water them regularly three times a day from a well, having no other means; and they are carefully littered in winter. So much for *Cows of Native American Stock*.

Very respectfully, E. A. N.

From the Genesee Farmer.

AGRICULTURAL SOCIETIES AND PREMIUMS.

THE utility of agricultural associations is yet doubted by many; it is also the policy of awarding premiums for excellence in agricultural products. It is said that labor and skill in agricultural as in other employments bring with them a sufficient reward. This may be true, as regards the individuals who exercise them; but it is the benefit of their example and the advantage of their skill upon others that particularly commends these measures. A profitable experiment in husbandry if known, will not long remain without imitators. These associations and premiums tend to bring into public view these profitable experiments, and to diffuse their benefits. Every man's skill and labor is emphatically a part of the common stock; and the more these are called into action, whether from a spirit of emulation, or the hope of pecuniary reward, the greater will be the accession to the public wealth and the public happiness; not that happiness and wealth are always synonymous, but that they are both particularly promoted by industry. Individual interests are essentially identified with the prosperity of the whole; and he who circumscribes his wishes to self, mistakes his interest as well as his duty to society. It is better to prevent want than to relieve it,—better to bring up a son to earn a fortune by industry, than to permit him to waste one in indolence. The object of these associations and of these premiums, is to call forth the latent powers of society, to stimulate the mind and the body to useful exertion, and to render them subservient to the general good. And this has been their happy influence wherever the experiment has been fairly made.

We have had occasion heretofore to illustrate this truth by reference to the County of Jefferson; and we appeal to the many of our readers who are as familiar with the concerns of that county as ourselves, whether they have not been a means of facilitating improvement in every branch of her husbandry, of increasing the profits of her labor, and of elevating the character of her population.

We recently spoke of the salutary influence produced by her Agricultural Society, upon the soil, the domestic animals, and the MEN, of Berkshire. That Society has existed twenty-two years; and it has gained in usefulness and in the affections of the inhabitants, as it has gained in years.

We have now another illustration to offer of the great public utility of these associations and rewards in the example of Scotland. Her Agricultural Society celebrated its half century anniversary last January. During the 50 years of its continuance, the agricultural products of Scotland have increased tenfold, in consequence of the improved system of her husbandry. Fifty years ago Scottish husbandry was in a miserably low condition; now it is surpassed in economical management and scientific accuracy, by no country probably in the world. What evidence, it may be asked, have we to offer that the Agricultural Society has been particularly instrumental in effecting this great improvement? We will content ourselves with stating some things that it has done, and leave the reader to judge how far they have conduced to so important a change.

The Highland Agricultural Society contains about 2000 members who pay annually £1 3s 6d (about \$5) or 12 guineas for life; and it embraces men of all professions, so intimately do all classes

there consider the interest of agriculture identified with their own.

This society expends about 2000 guineas (or more than 8000 dollars) annually in premiums: about one half of this is awarded upon live stock, the residue upon various objects, as for essays, plans and reports,—experiments and improvements, on crops and culture,—the laying down and managing pastures,—products of live stock,—on managing woods and plantations,—on implements of husbandry and useful machines, &c. &c.

It has also established a Veterinary School under a competent professor (Dick) which has 50 pupils acquiring a knowledge of the anatomy of cattle and the diseases to which they are incident, and the methods of cure. A museum of anatomical preparations, and a hospital for animals under treatment is attached to the school.

It has published several volumes of papers, comprising satisfactory information on subjects connected with every department of rural and domestic economy.

It has by its rewards, called into exercise the mechanic skill of the country; and brought into use many of the most perfect machines and implements of husbandry now in use.

It has formed a museum of models of agricultural implements, made to a uniform scale, "the most complete collection of the kind any where to be met with." And

It has contributed much to the construction of roads, bridges, and canals. B.

CARE OF FARMING TOOLS.

A TOPIC not yet sufficiently enforced on the attention of farmers, is the wasteful negligence evinced in the exposure of agricultural implements to the injuries of the seasons. The sled curling and cracking by the side of the wall in summer, and the cart half buried in snow and seasoning in the winter storms, are symptoms of waste and extravagance, which ripen into a consumption, to be hastened to premature termination by the visits of the sheriffs. The whole secret of wealth consists in economy, and the prudent care of those small rills which without great vigilance, are slipping through the chinks of the best woven purse; and it may be considered quite as safe to predict that none of these slovenly gentlemen will be prosperous, as to write in the style of the calendar soothsayers, through the printed pages of the month of January, "expect snow about these days." The price of the time lost when it is most valuable, in putting the exposed articles in proper repair, not speaking of the cost of the materials and the interruption of business, would defray the expense of erecting ten such cheap sheds as would cover them from the storms, protect them from decay, and keep them ready for immediate use.—*National Egis*.

CURE FOR GANGRENE.

In an account of a fight between a party of Waccos and Tawackanies, Indians, and a small party of Americans, in Texas; in November, 1831, recently published in the Philadelphia Post, we find the following singular method of curing the leg of one of the party, which was shattered during the action by a musket ball. It was lucky for David Buchanan that no surgeon attended the party, or he would have been 'a peg shorter' all his days:

"David Buchanan's wounded leg here mortified, and having no surgical instruments, or medicine of any kind, not even a dose of salts, we boiled some live oak bark very strong, and thickened it with pounded charcoal and Indian meal, made a poultice of it, and tied it round his leg, over which we sewed a buffalo skin, and travelled along five days without looking at it; when it was opened the mortified parts had all dropped off, and it was in a fair way for healing, which it finally did, and his leg is as well now as ever it was."

HIGHLY IMPORTANT.

Dr. Buisson is said to have discovered an infallible remedy for hydrophobia, which he has communicated to the Academie des Sciences, in Paris. He had no expectation of recovery, and went into a vapor bath heated to 42 degrees Reaumur (126 Fahrenheit), as the easiest mode of suffocation. To his astonishment, the whole symptoms vanished at once, and he has never since had the slightest recurrence of this dreadful disease. By the same means he has cured upwards of eighty patients, and he intends to try its efficacy in cases of cholera, plague, yellow fever and gout.

CHOLERA.

THE disease called spasmodic Cholera appears to have been unknown previous to 1817, when it appeared in India. Since that time till near the end of 1832, a period of about fifteen years, there has been throughout the world, as nearly as can be estimated, one hundred million cases. Of these fully one-half at least, must have died—which gives a mortality from this single disease, of 50,000,000 in the above period, or upwards of 3,333,000 annually. In India alone, the mortality has exceeded 18,000,000. These calculations have been made by Jonnes, the celebrated French physician, and it is estimated they are rated under rather than above the truth.

SKATE RUNNERS.

At Drontheim, in Norway, they have a regiment of soldiers, called Skate-runners. They wear long gaiters, for travelling in deep snow, and a green uniform. They carry a short sword, a rifle fastened by a broad strap passing over the shoulder, and a climbing-staff seven feet long, with an iron spike at the end. They move so fast in the snow, that no cavalry or infantry can overtake them; and it does little good to fire cannon balls at them, as they go two or three hundred paces apart. They are very useful soldiers in following an enemy on a march. They go over mountains and marshes, rivers and lakes, at a great rate.

When King Charles XII. was shot at Fredericks-hall, a Skate-runner carried the news four hundred miles, twelve hours sooner than a mail messenger, who went at the same time. There were then seven thousand Swedes laying siege to Drontheim. When the news came, they broke up their quarters, and retreated as fast as possible. They were obliged to go over the mountains, and the snow was deep, and the weather exceedingly cold. Two hundred Skate-runners followed hard after them, and came up with them one very cold morning. But all the troops were dead, having been frozen in their tents, among the mountain snow drifts. They had burnt every morsel of wood, even the stocks of their muskets, to warm themselves.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JAN. 15, 1833.

Mr. COLEMAN's excellent Address, we have received, printed in a neat pamphlet. The author will accept of our thanks for his donation, and we shall be happy to transfer it, as soon as practicable, to our columns.

"A Subscriber," who requests us to publish a list of the prices, paid for Mr. Williams' stock, is respectfully informed that we have not yet been able to procure such list. Should it come to hand, we will give it an insertion.

ON CUTTING WOOD FOR VARIOUS USES.

THERE has been much diversity of opinion relative to the time of the year most proper for cutting wood for timber or fuel. *Goodsell's Farmer* of the 26th ult. observes "that where durability is the object, timber should be cut at that season when there is least sap in it, say in February; but where it is for the purpose of clearing land, and the timber to be cut is of a kind likely to sprout, then it is desirable to have it cut when there is most sap in it, as that not only prevents the stumps from sprouting, but they rot much sooner than when cut in February."

This opinion of Mr. Goodsell is corroborated by a writer for the *New York Farmer*, in a communication republished in the *N. E. Farmer*, vol. 10, p. 237, 238. In this it is stated, "we do not seem sufficiently aware of the range of expansion and contraction of green and growing wood, or the extent of variation in bulk expanded and contracted by heat and cold. When occupying the least space the wood is of course most dense and compact, and it has then the least possible quantity of sap in it. More than 50 years ago my father had occasion for a barn floor, for use in winter, the British having been so managed that the farmers of the north could return to their farms, on doing which his was destitute of a barn floor. In the depth of winter, as the only alternative, he cut down—felled as the paper farmers say, large red oak trees, had them sawed into 2 1-2 inch planks, and laid his floor, perfectly green, expecting to lay them over again when they got seasoned and shrunk as he supposed they would do. This was all done in the severe cold of a northern winter, and that floor has never yet been overhauled, nor have the planks opened a seam. The sap was all in its winter quarters in the roots under the blanketing of the muck, and of course could not be in the tree, which was compacted into the smallest possible space. The hoops of winter, in these days, were driven with tremendous force.

"From all these considerations, and facts, (I could cite multitudes of similar facts,) I come to the conclusion that the proper time to cut wood for timber is when the sap is least in quantity in such wood, and when this is least likely to lead to a fermentation. The more saccharine matter it has in it, the more likely it is to lead to this process, as well as generally, the more sap. The sugar maple, which abounds in this quality, if cut immediately after the growth of wood of the year and stripped of its bark, becomes even very durable as fence posts, if not set till thoroughly seasoned. The same is also true of hemlock, and several other kinds of wood, but they must be well seasoned, before set into the ground, as all fence posts

should be. When wood occupies its least possible space, it is a good time to cut it both for fuel and timber."

The late Col. Pickering, in an essay on "The Felling of Trees for Timber," published in the *New England Farmer*, vol. 1 page 17, gave certain facts which led him to believe that "the best time for felling timber trees, for durability, was when their sap was vigorously flowing." Other writers, too numerous to be here quoted, have also recommended May and June, as the proper months for cutting down timber trees, where durability is the object. We will, however quote another passage from Col. Pickering's essay above referred to.

"Accident threw in my way the late Oliver Evan's book on the construction of mills, to which was subjoined a treatise of a Mr. Elliot, a millwright, on the same subject. Turning over some of the leaves of this treatise, I lighted on the passage in which the author directed hickory timber, intended for the cogs of wheels, to be cut when the sap was running, that they might not become powder post."

Col. Pickering adverts to the case of "a farmer, the well pole (or sweep) of whose well happened to break at a very busy time, and to supply its place he cut down the first small tree, which came to hand; and this was a white birch. The sap then running freely, he put up his pole, and it lasted seventeen years. Had he put it up with the bark on, it would, probably, have rotted in a year; the closeness of the bark would have prevented the escape of the sap. A close coat of paint laid on unseasoned wood operates like the close birch bark, by confining the sap, and hastening the decay."

Dryness is favorable, and moisture unfavorable to the durability of timber. Green and growing timber has less moisture in winter than in spring or summer; but its pores being less open in cold than in warm weather, it cannot so well become dry before it becomes rotten. But in spring, summer, and perhaps the forepart of autumn, the pores of green wood are comparatively open, the moisture more easily exudes or escapes, provided said pores are not sealed by the bark. If one wishes to cut wood, and proposes to let it lie, without being deprived of its bark, winter is his time, with reference to durability. But if it is proposed to strip the bark from the tree, the time when the bark peels most easily, will, we believe, be the season in which other things being equal the timber will endure longest.

If it is wished that when wood is cut, the tree may sprout, and reproduce another cutting of timber or fire wood, it is best to conform to the practice of Gen. Newhall, of Lynfield, Mass. who observed as follows:

"Having woodland, from which I have cut, annually, for several years past, from twenty to fifty cords of wood, it has been my practice to have it cut at the time and in the manner that would best insure a strong and vigorous growth of sprouts. To effect this purpose, I never allow a tree to be cut till after the autumnal frosts have caused the leaves to fall, and the sap to descend to the roots, nor later in the vernal season than the month of April. The manner of cutting, is to leave the stumps nearly on a level with the surface of the ground, from which the suckers are much more strong and vigorous, and less liable to be injured by high winds, than a growth from stumps cut twelve or fifteen inches high, as is the practice of some."

"Pursuing this course, I have never been disappointed; and have now on land from which trees were cut in the midst of winter, a growth of sprouts, of the most vigorous and promising appearance."

"Respecting large trees, the growth of centuries, cut them at whatever season you please, there is scarcely one stump in a thousand that will produce suckers."

"In a community where fuel is an expensive article, every proprietor of woodland should manage it in such a way, as not only to be profitable to himself, but, as shall preserve the growth for the generation to come."—*N. E. Farmer*, vol. x. p. 9.

MASS. HORTICULTURAL SOCIETY.

Horticultural Hall, Jan. 11, 1834.

EXHIBITION OF FRUITS.

THE season for the exhibition of fruits, &c. being nearly over, but few specimens were this day exhibited—those few, were however, of the first quality, and from distant sources.

From Judge Buel of Albany, the *Jonathan Apple*, a new and superior fruit, and esteemed in its season, by him and other good judges in that vicinity, as one of the most beautiful, excellent, and admired of all known. I have been lately favored by this gentleman with descriptions of some of their very best varieties, and from these I extract the following—

JONATHAN. *Philip Rick* of the Kingston Orchards, "Fruit round, flattened at the ends, regular shaped, 2 1-2 inches in diameter, and 2 1-4 deep. Eye in a broad deep cavity, slightly angular. Stem 3-4 of an inch, slender, in a deep, round cavity. Skin thin, of a pale red, blended with faint yellow, with brown specks, and deepening into bright red and dark purple, particularly near the stem on the sunny side. Flesh very tender, white, occasionally tinged with red. Juice, very abundant, rich, and highly flavored. Core, very small. Named in compliment to my friend Jonathan Harbrauck, Esq. of Kingston, N. Y. to whom I am indebted, originally, for this excellent apple. The original tree, it being a seedling, is growing in Woodstock, Ulster county, on the farm of Mr. Philip Rick. Ripe from Dec. to April."

From Charles H. Olmsted, Esq. of East Hartford, Conn. specimens of the *Belmont Apple* were received. These were brought by him from Rockport, Cayuga Co. Ohio. The *Belmont* is a very large, round fruit, the stalk short; of a pale straw color, with brown specks; a faint blush next the sun. The flesh tender, juicy, of a rich, subacid, and excellent flavor. See Mr. Olmsted's letter, inserted below.* Also, another variety was sent by Mr. Olmsted, its name unknown, from the farm of Mr. Samuel S. Belden, of East Hartford—A round fruit, of good size, of a white or pale straw color, slightly covered with red, next the sun; of a saccharine, slightly acid, and good flavor.

For the Committee,

WILLIAM KENRICK.

ITEMS OF INTELLIGENCE.

A young man named J. H. Marshal, of Newport, lost his way on the Sunapee mountain on Thursday last, and was compelled to spend a night amidst its dreary summits during a severe snow storm. When he reached a house the next day he was nearly exhausted.

* The letter here referred to, has not come to hand.—Editor.

Recent falls of snow have impeded the travelling, and in many cases, detained the mails beyond their usual time. The stock of snow now on hand, is very large for the season, accompanied with an atmosphere favorable to its remaining.

We learn that the new bridge across White River, at Royaltown, gave way, a few days since, under the immense weight of snow upon it.—*Woodstock Vt. Courier.*

Steam Boat Disaster.—The steam-boat *Missourian*, while navigating the Mississippi, on the 4th ult. about 25 miles below Natchez, collapsed one of her flues, by which accident fifteen persons were badly scalded; several of which have since died.

An Incident worth recording. We yesterday saw at one of the banks in State-street, a parcel of American gold coin, worth nearly a thousand dollars, which had been sent in from a country bank. So large an amount of American gold is an unusual collection in any bank, and could not, probably, be found in another. The history of this lot, as it is a little singular, is worth recording. It belonged to a man in the county of Berkshire, in this State, who had been hoarding it up since 1810, a period of twenty-four years, because he had not sufficient confidence in banks and bank securities, to invest his gains in a manner to give him interest. The consequence is that he has lost, in interest, much more than the amount of his principal; and when he wanted to pay for his farm, he was obliged to sell to a bank at about one per cent. advance, what has been lying like dead stock upon his hands for years, and might, by a proper investment, have brought him six per cent. a year. Some of the pieces were of the date of 1795, and few, if any, of later date than 1812.—*Boston Courier.*

A lemon fell from the tree on which it had been growing two years, in Newark, N. J. on Thursday last, which measured 12 1-2 inches one way, and 9 1-2 another, and weighed ten ounces.

We have the most flattering accounts of the Gold Region of Alabama. The Georgia Democrat states, that it "averages forty miles in width and the gold is said to of the fineness of twenty three and a half carats."

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5 1/2 miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated *Pears alone*, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus MULTICAULIS* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. Horse Chestnuts as hardy as oaks—Weeping Willows, Catalpas, Mountain Ash, Silver Fir, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Peonies, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—early in Autumn being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

MANUAL OF THE MULBERRY.

Just published, the second edition of Cobb's Manual, containing information respecting the growth of the *Mulberry Tree*, with suitable directions for the culture of SILK, in three parts. This edition is an improvement. Price 50 cents. For sale, by GEO. C. BARRETT, N. E. Farmer Office.

SEEDS FOR 1834.

FOR sale at the Seed Store connected with the N. E. Farmer Office:

200 bushels finest Early Peas;
100 " Large Marrowfat do.;
25 " Dwarf Blue Imperial do.;
50 " other varieties;
100 " Best Garden Beans;
" Dwarf and Pole, Early and Late, do.;
300 lbs. superior Long Blood Beet Seed;
100 " Early Turnip " "
300 " Cabbage Seed, 14 different kinds;
250 " Fine Long Orange Carrot;
100 " Early Horn, do.;
200 " Common Cucumber;
150 " Long Green, do.;
100 " Early and Head Lettuces;
25 " Pure White Portugal Onion;
100 " Silver Skin " "
100 " Large Deep Red, " "
200 " Large Dutch Parsnip;
150 " Early Scarlet Short Top Radish;
50 " Long Salmon; " "
25 " Turnip Radishes;
100 " Spinach;
150 " Early Scollop Squash;
50 " " Long " "
50 " Long Winter, do.;
25 " Salsafy;
100 " Early White Dutch Turnip;
200 " English " "
100 " Ruta Baga, " "
200 " Mangel Wurtzel For Cattle.

Also—Cauliflower; Broccoli; Celery; Cress; Egg Plants Leek; Endive; Musk and Water Melons; Marthynea; Pepper; Parsley and Tomato Seeds by the lb. or oz. *Herb Seeds*, of all kinds.

50,000 Papers in 200 to 300 splendid kinds of *Annual, Biennial and Perennial FLOWER SEEDS.*

GRASS SEEDS, Wholesale & Retail.
The above comprises in part the stock of seeds raised expressly for the establishment, and the quality and goodness will be warranted superior to any ever offered heretofore. Dealers and others will please file in their orders immediately, and they shall be faithfully executed for the spring.

Boxes of Garden Seeds for the country trade, neatly papered up, with directions on each paper, for sale at a large discount from marked prices.

FRUIT & ORNAMENTAL TREES, &c. will be supplied in the spring, and orders are solicited.

GEO. C. BARRETT, Agricultural Warehouse,
Nos. 51 & 52, North Market Street.

TO BE LET

THE whole, or part of a Farm, in the vicinity of Boston, containing about 95 acres of good land, with a convenient House, Barn, and out houses—of which possession may be had on the 1st of April next—Provided application is made by a capable, steady and industrious man, of good moral character, and who has been educated in the business of Farming, and who will produce a good recommendation of such qualifications—and none other need apply.

For further information, enquire of the proprietor and publisher of the New-England Farmer, at his Office, Nos. 51 & 52, North Market Street, Boston.

STEAM RICE MILL, AT SOUTH BOSTON.

THE subscriber having purchased the Patent Rice Machines of Messrs. Strong, Mooly & Co. of Northampton, with the exclusive privilege of using them in Boston and a large vicinity, has put them in operation at South Boston, near the Free Bridge. It is well known that rice in its rough state, or with its outer hull on, will keep many years, and that after being cleaned, it is subject (particularly in warm weather) to weevil, and other insects, and is usually put in bad casks—he therefore hopes, by having this article always in a fresh state, in casks of different sizes, to meet with a ready sale. The mode of cleaning being entirely different from any other now in use in any other country, the grain is kept quite whole and very clean. It will be put in good casks of usual size, for export; also in barrels and half barrels, and in bags of 100 lbs. each. (which may be returned;) also, ground into fine Flour, in quarter barrels—it will be delivered in any part of the city, for a reasonable charge, and will not be sold in smaller quantities. Also, the fine Bran, or Flour, so called in the Southern States, being the inner coat of the grain, excellent food for horses, cows, hogs, sheep and poultry—and the outer Hull, a prime article for packing glass, crockery, bottles and fruit, and is believed will prove valuable in making Coarse Paper, will be sold at a low price in large quantities.

This Rice is particularly recommended for whaling ship, and others going long voyages, as from being highly polished and free from dust and flour, and being put into their tight iron bound casks, it will be free from any insects, until exposed to air.

[] An Order Box is placed in Mr. Roger's Foreign Letter Office in the area of the City Hall, and a sample of the Rice in the several Insurance offices, State str. JOHN PRINCE.
Boston, Nov. 16, 1833.

STIMULATION OF SOILS.

THE theory of vegetation presents a great field for discovery. What constitutes the food of plants? In what degree is nutrition derived from the soil? In what from the atmosphere? To what extent does manure operate on the soil? How on the atmosphere?

This is an important as well as intricate subject, and much may be expected from the increasing light and knowledge of the age, and from the diligent spirit of inquiry which is now in progression.

You have, yourself, Mr. Editor, broken a lance in the controversy with a scientific cultivator of Albany on the effects of lime on soil.

Differences of opinion, like those exercised in this case, must doubtless lead to the extension of knowledge. But the danger is that whilst very opposite theories are strongly urged, an improper distrust may be excited. The subject, though important and beneficial may thus fall into neglect and disuse, whilst a decision is waited for, at which we may never arrive with the wished for accuracy.

From a frequent perusal of the benefits derived from lime in its application to soil in Europe, I have been induced for more than a score of years, successively, to make use of it for agricultural purposes to the extent of more than one hundred casks annually.

One of my first experiments arose from a desire to give a top-dressing to a piece of land, which it was otherwise inconvenient to do. The soil was a heavy black loam. Having a quantity of black earth from a trench, (or top stratum) I procured a quantity of lime. A bottom of four or five buck loads of earth was first placed; then a couple of casks of lime were spread thereon; then earth and lime again, till my materials were used, or the quantity needed was had at the rate of eight or ten casks to the acre. Thus a cask being supposed to produce about five bushels of slacked lime, the cost of which, if the casks are swelled and the lime partly slacked is eight to ten cents a bushel. This is the most moderate application in Europe, and the cost is about the same.

This mixture after lying twelve or fourteen days was shovelled over, and after some days being found fine and well mixed was spread from the cart on the ground. To my surprise I found the effect produced to be equal to what is usual from common compost manure!

In England, where lime is most used for agricultural purposes, it is considered that in its crude state, or uncalined state, it is most beneficial, if pounded or made fine. This, where limestone abounds it is well to know; but there is little of it in this neighborhood. Encouraged by this experiment, I continued to purchase and apply considerable quantities of damaged and air slacked lime* in my cultivation, particularly for a low, flat piece of land. This being intersected with small ditches, furnished the earth. I was not able

otherwise to procure to mix with the lime. It is not well, however, in such cases, to lower the surface by taking off more than will keep the ditches open. When the earth is tough with sward, &c. it may be made finer by being carted out and put in heaps on the ground, and spread afterwards. Indeed this is done to great advantage in the winter. The poaching the land or making a rough surface for the scythe being then well avoided.

As this land cannot advantageously be ploughed, I have in applying every third year a top-dressing as my custom is, alternated, giving first a dressing of earth and lime, and at the expiration of three years, a coat of compost manure.

This has been done on the principle that a more judicious mixture would be made, and a better composition of soil be had. I have been guided herein from general reasoning—not from any proof that the lime might not be repeated.

It seems, however, to be a prevailing opinion, where lime has been most in use, that it opens the sod and makes it more porous, giving thereby a better action to other manures, which a judicious husbandry should in succession apply. In this application of lime to a grass sward, in a deep springy soil, I have been for a long time well satisfied. It was several years before I undertook the same practice on a light soil, and I did it with less expectation. But I was somewhat surprised to find it equally beneficial.

So far lime has been mentioned as a component article in top-dressing for a grass sward. Its effect will be shown on ploughed land, and in a grain crop.

With a view of increasing fertility, I frequently have applied on the side of the hills of Indian corn a small handful of slacked lime. I so placed it, lest the caustic quality of the lime should prove injurious to the tender plant when it first started from the soil. This is my opinion and practice. Though I have often since seen large pieces slacken and expand on the soil without injury to the grass, which in a lively green color pierced through it. This application of lime to the hill I continued for some time, and though small in quantity or effect, I still thought it of some advantage. I was led, however, to a more extensive and satisfactory experiment.

I had a piece of ground of about four acres, of rather light soil, which gave promise of a very small crop of grass. Being without the means of obtaining manure, as I had a quantity of earth of the top stratum, taken up on building a wall, I forthwith procured a quantity of lime and mixed it in the manner before mentioned. About the middle of June I had the grass mowed and the land ploughed. The lime compost was then spread and lightly harrowed in. An early sort of yellow corn, which when ripe husked itself was procured. And my neighbors, who knew the process, were, in the fall of the year, much surprised by the stout ears of golden grain thus unfolded to view!!!

I trust enough has been said to show the beneficial use of lime. Whether it acts on the atmosphere only, or as a stimulant to the soil, or actually contains (as is strongly maintained by some)

within itself the food for plants is well worthy of discussion.

But whether either of these causes separately or they altogether conduce to the nutrition of plants, an advantageous effect of the use of lime on soil seems conclusively to follow. I have endeavored to avoid nice discriminations and have stated my practice plainly, not from its novelty to many of your readers, but because not only a great waste is made of this article but it is believed that at its average price in good condition, about ten cts. it may be used to good advantage. So also it is with mortar, rubbish of walls and chimneys, plaster, &c. from old buildings. These, (and it is somewhat relative to this discussion) I have made use of as a top-dressing to low soil to very good effect.

It has been observed that if lime is a fertilizer of soil why is it that where it abounds and often forms an under stratum a greater fertility does not prevail? To this it may be answered that lime is a constituent principle, it is believed in all soil, and may be supplied, where from experience a deficiency is found. But when it superabounds as in most other things excess may be injurious. In all this more experience is wished for as the only safe and profitable guide.

Yours, &c. JOHN WELLES.

THE following able dissertation, on an obscure but important subject, will be read with pleasure by every person, who can realize the truth that improvements effected with regard to cultivated vegetables are of still more consequence to the cultivator than introducing improved breeds of animals.

For the New England Farmer.

POMOLOGICAL.

I accept, Mr. Editor, the invitation of your correspondent, M. S. and send you my opinions and observations as to the cause of the variation of fruits, &c. produced from seeds.

I consider that plants are governed by as fixed laws in regard to propagation, as animals are; that the character of the progeny, in both, partake of the qualities of the parents, and of these alone; and that a cross of two varieties of fruits, of like species, may be obtained with as much certainty, as a cross from two varieties of the same species of animal. There is this difference—though the progeny of the animal can have but one father, that of the vegetable may have a plurality of fathers. Hence the uncertainty of seeds, of which different varieties of the same species flower at the same time in the vicinity of each other, producing like the female parent. The female organ of an apple blossom may be fecundated with the pollen of fifty different kinds, in the space of half an hour. The seeds of all plants where but a single variety is cultivated or grows in the neighborhood, as the butternut, chesnut, wheat, corn, &c. will uniformly produce their kind. An isolated tree, far removed from all others of its species, say of the apple or pear, will do the like; and the peach produces its kind with more certainty than the apple, from the fact, that a single variety, or single tree, is more frequently grown at a distance from other varieties than is the apple. We see

* Lime long exposed to the air, such as sweepings of stores, &c. is of less value and more cheaply obtained.

this law of the vegetable kingdom beautifully illustrated in our corn-fields. When there is but one kind planted, as the white, yellow, flint or gourd, there will be but one kind in the product. Where there are two kinds in adjoining rows, they will intermix. The pollen of the male organ of the blossom must come in contact with the pistil or female organ, or the seed will be abortive. Cut off the tassels as they begin to develop, of a hill of corn standing alone, or cover or destroy the silk of a particular ear, so as to prevent the contact of the pollen, and you will find at harvesting nothing but a naked cob.

Upon this law of the vegetable kingdom florists have based their practice of multiplying the varieties of the most esteemed flowers, as the rose, the dahlia, the comelia, geranium—the new varieties being the product of artificial or accidental fecundation of the pistil of one with the pollen of another variety. And the experiments of Knight and other pomologists have left no room to doubt upon this subject. The distinguished gentleman I have named has not only, by artificial crossing, produced new and superior varieties of garden and orchard fruit, but many new varieties of culinary vegetables. I have in my grounds several of his apples and cherries produced in this way, and know the parents from which they were produced. So far as I can now judge, the wood partakes more of the female, and the fruit of the male parent. The Faxley and Siberian Harvey apples, from the seed of the Siberian crab, fecundated with the pollen of the golden harvey, resemble in hardness of wood, shape of tree, and beauty of foliage, the male parent; while the size of the fruit, in the new kinds, is generally intermediate between that of the parents. It is worthy of remark that the wood of all the new kinds is remarkably clean and healthy, and would seem to strengthen Mr. Knight's theory, of the deterioration of old varieties.

In regard to the fecundating process, your correspondent asks, by way of doubt of the generally received opinion, "how did the first varieties of fruits originate?" I am a yankee, and will answer his question by asking, *how did the first varieties of animals originate?* A solution of my question will afford an answer to his.

I believe with Mr. Knight and Dr. Van Mons, that the seeds of young and healthy varieties will be more apt to produce good fruit, than those of old and decayed varieties of the same quality; because the progeny, as I have observed, will partake largely of the youthful vigor of the male parent—and I suspect your correspondent has misapprehended Prof. Poiteau; and that the Professor prefers seed of austere pears, not on account of the quality of the fruit, which, I conceive, is not likely to be perpetuated by the seed, for the reasons I have stated, but because the poorer sorts grow only upon seedlings, or young and healthy varieties—poor pears never being perpetuated by grafting and budding.

There is a fact in vegetable physiology which to me is inexplicable, and which I should be very much obliged to any of your correspondents for an explanation, it is this:—It is well known to nurserymen that the roots of a grafted or budding tree take the habits of the scion, that is, they are numerous and ramified, horizontal or deep, according to the habits of the variety from which the variety is taken, and generally conform in their direction and volume to the shape and abun-

dance of the top; and yet the sprouts which spring from these roots invariably, I believe, take the character of the original stalk. I will state a case: bud a peach on a plum-stalk at the surface of the ground, when it has but a few inches of root, the bud not only gives a character to the branches and fruit, but apparently to the roots which succeed, and which are alone produced by the sap elaborated in the peach leaves, and yet the sprouts which shoot from the roots will be plum sprouts. My wonder is why the roots should retain the character of the stock, after they have been enveloped and seemingly lost in the growth produced by the scion. The quince and the paradise apple are the only cases that I remember in which the character of the roots are not materially changed by the scions engrafted into them.

The process of obtaining good fruits from seed, is tedious and uncertain. Perhaps not one in a thousand will be worth preserving, and years must elapse ere the question can be solved. Whereas by grafting good kinds may be obtained with certainty. Our nurserymen make it their business to collect and propagate all the good varieties, whether native or foreign; and any gentleman who is not acquainted with their relative merits, and very few are, will find it his interest to confide to them, partially or wholly, the selection of his fruit trees. The difference in the profit of cultivating good or bad fruit is immense. A neighbor this year sold pears from two trees for \$45; while other neighbors did not realize this amount from fifty trees of bad or indifferent fruit.

Albany, Jan. 12, 1832.

For the New England Farmer.

RURAL TASTE.

MR. EDITOR,—In riding through most of the towns and villages of New England, I have been surprised at the almost total want of rural taste which is manifested by a large portion of our respectable, and in many instances, wealthy farmers.

One would suppose that the proneness to rural life among the higher classes of society, would have a salutary effect in producing a taste for picturesque gardening in the minds of our country people. Nothing would be easier than to make our villages appear like those of Europe, if the owners of our soil were disposed to have them so. A very little labor combined with taste and judgment in decorating, might make the habitations of our farmers, equal those of the English yeomanry. There the poorest laborer attends to the embellishment of his little cottage. The green hedge, the grass plat before the door, the little flower-bed, the grape or woodbine trained against the wall, and covering the lattice with its cooling shade, the pot of flowers in the window, all bespeak the influence of taste, refinement and industry. What adds more to the appearance of a house than a few trees tastefully disposed around it, or what looks more repulsive, than one destitute of these natural ornaments? Trees planted along the sides of our roads, would also greatly improve the appearance of our country, and afford refreshing shade and comfort to the traveller. When our forests offer so many splendid varieties of trees, ornamental as well as useful, at no expense, other than the trouble of transplanting them, it is a matter of wonder that they are not more frequently

made use of. We do not expect to see an extensive lawn, or park, attached to every farm-house; this, we are aware would be impracticable: but what we want to see, is a tasteful display of shrubbery and flowers, which will cost little or no expense, while it adds immensely to the value and appearance of the place, as well as to the pleasure of its owner. We anticipate a great reform in this branch of rural economy from the influence of our Horticultural Society. It has already accomplished much, but still much remains to be done. And as temperance has banished from many of our towns the use of ardent spirits, we think a small portion of the money formerly expended in the purchase of this destructive article, might be more satisfactorily devoted to the embellishment of houses and farms.

J. S. M.

For the New England Farmer.

AGRICULTURAL ESSAYS, NO. XIV.

DUNG. There are several kinds of dung, as there are of soils on which to lay it.

ASHES. Best for low, mossy lands, spread evenly on the ground. A few bushels, sowed just before a rain, a good top dressing for an acre—fifteen bushels a full dressing—it will be seen for several years—peat ashes best—fifteen bushels to an acre. DOOR-DUNG for melons—COW-DUNG for a warm, sandy soil. HOGS-DUNG for flax, corn and potatoes, and for all kinds of vines. HORSES-DUNG for a low, wet soil. HUMAN-ORDURE mixed with a great quantity of soil, for cold, sour land, and for recruiting old pear-trees. SHEEP and FOWLS-DUNG, for a wet sour soil. SLAUGHTER-HOUSE-DUNG is very excellent. And beside these several kinds of dung, there are other manures, such as LIME, for a cold stiff clay soil, 120 bushels to an acre—it destroys moss, mixed with green sward, in layers, the composition will be fit for use in six months, in summer. URINE, or STALE is also excellent manure, and when saved, of as much value nearly, as the dung itself of the stock. And to save it in summer, as soon as your barnyard is cleared out, in the spring, take the first leisure hour, and take care to find such an hour, to cart in a large quantity of loam, mud, clay, rubbish, broken peat or even sand; which will absorb the urine, and being mixed with the dung, make a most excellent manure. In winter, a great part of the stale may be saved, if you have a tight floor, by giving the cattle a plenty of litter: every night a fresh layer of chaff, flax-dressings, or what ever the barn affords. MUD from ponds, in the opinion of some Farmers, is equal to good dung for Indian-corn, planted on a dry gravelly soil: SEA-MUD also is very good; but all kinds of mud are better when laid in the barn-yard and trodden into the dung and stale of the cattle. They should be shovelled into heaps and lay a few days before they are carried into the fields for use. Some Farmers have long and narrow cow-yards by the sides of roads, or elsewhere, in which they yard their cattle every night; and every two or three days they plough them deep. This mixture of soil, dung and stale, is said to be equal to any manure which is made. It must be very good for grass land, spread as soon as the crop is mowed off.

EWES. Breeders should have long and fine wool. From October first, to November twentieth keep the males from them—feed them well for some days before yearning. Let them have good feed from their first going to pasture, till the mid-

dle of July—this will make fat lambs, and the ewes themselves will be fit for market.

FLAX, a most useful and profitable crop to the farmer—does best in moist land—at nine pence per pound, one acre will gain six pounds clear profit. After the ground is well manured with old and rotten cow-dung, or with the contents of the hogstye, plough and mix the soil well—it cannot be too much pulverized, and then, in early season, which will give the best ~~coat~~ to the flax, sow from seven to eight pecks of seed on an acre—fresh and new seed every year, and from a good distance, the crop will be the better. Pull it when the leaves are fallen from the stalk, and when they begin to have a bright yellow color, and the bolls are just beginning to have a brownish cast. If you water rot it, pull it when the blossoms are generally fallen. If you dew rot it, when it is done sufficiently, the coat will separate from the stalk, at the slender branching parts, near the top ends.

FOALS should be fed when weaned with sweet hay, oats and wheat bran. For the first winter allow one sixteen bushels of oats; afterwards he will do with good hay. A late foal should not be weaned before March, and have oats all winter. Within one month after the foal is dropped, it receives its shape, &c. which it will ever after retain—you may then see your future horse in miniature.

FOWL-MEADOW GRASS does best on low lands, swamps, &c.—keeps green a long time—bears a great burden—is excellent fodder especially for horses, and may be mowed, from last of July, to first of October.

FODDERING should not take place till really necessary; and then only in mornings.—The worst fodder should be given out in the coldest weather. Never lay so much before your cattle as will serve to fill them—fodder twice in the morning and twice in the evening. The leavings of horned cattle may be laid before horses, and the leavings of horses before those who divide the hoof; they will eat after each other. If any thing be left in the mangers of the cattle, carry it out into the open air, and spread it on clean snow. Young and hardy stock will winter well on coarse meadow hay and straw. Every farm-yard should have a long shed, and a rack under it, in which to fodder in a clean and profitable manner—very necessary for sheep.

GOOSE, more profitable than a dung-hill fowl. Pluck your goose but once in a year, and at moulting time, or when they shed their quills.

GRAZING. Kill grass fed heeves by the first of November, for, after that the grass soon loses so much of its virtue, that it will not fatten cattle at all—they will fall away.—Vales for tillage, hill for pasture.

HINTS TO FARMERS. NO I.

PRELIMINARY.—Now that the bustle of election, and the shouts of the victors, have somewhat subsided; our crops secured, and the bleak winds of December have driven the husbandman from his fields to his fireside, I propose, Mr. Editor, to devote an occasional evening to the entertainment, and I would fain hope to the improvement, of your agricultural readers; provided you are disposed to second my efforts by publishing what I may chance to write: For as yet I feel the wish, without being conscious of the ability, either to instruct or entertain them.

My essays shall never be tediously long. They may sometimes be practical, sometimes theoretical, and, perchance, sometimes political; but partaking neither of personal or party politics.

You have now my proposition, sir: and I shall consider you as according to it when you publish these preliminary remarks, and shall proceed without any delay to fulfil my task. B.

Westerlo, Dec. 12, 1832.

The adapting crops to the soil and market, are among the first considerations which present themselves to the discreet farmer. The same soil that will produce a profitable crop of one kind, may not repay the labor of cultivating another. The hills and mountains that make the richest pastures, may be illy adapted to the production of grain. And the same farm product that is profitable to the farmer in the vicinity of towns or navigable waters, may be wholly unprofitable in a district remote from them. In newly settled districts, where the opportunities of interchange and marketing are precarious, it becomes in a measure necessary, that the farmer should adapt his husbandry to the immediate wants of the family, and produce his own bread, meat and clothing. Like causes often render it necessary that he should also be his own mechanic—as carpenter, shoemaker, &c. Distance, bad roads, and the want of means, leave him no other alternative. But in old settled districts, where the facilities of intercourse and trade are abundant, considerations of economy suggest a wiser course—that the farmer should apply his labors to such objects as will ensure him the best profit.

If we look to our fields and woods, we shall see that the natural products vary in different soils; that many trees and plants which spring up spontaneously in clayey grounds, are not to be found in those which are sandy, and *vice versa*; that some are peculiar to wet and others to dry grounds; and yet that there is a constant tendency to alternate or change—new species of trees and plants taking the place of other species which have been felled or have died. This is not the result of chance; but it is in accordance with a law of nature, which has endued plants with different habits and wants, and provided in different soils the food best suited to those habits and wants respectively. It is analogous to what we see in animals—almost every class of which, as the ox, the dog, the hog, &c. has its peculiar food. Those who would profit from the works of infinite wisdom, therefore, will do well to study the aptness of their soils for particular crops, and to select those for staple culture, which promise the best reward.

Heavy and cold grounds are found to be most congenial to wheat, oats, timothy, peas, &c.; light and warm soils to corn, barley, ryé, and turnips; moist grounds to potatoes and fibrous rooted grasses; dry grounds to clovers, lucerne, turnips and other tap-rooted plants. Yet all these crops fail, or are comparatively worthless on lands habitually wet. Hence it is of the first importance, in order to obtain good tillage crops, or the fine nutritious grasses, upon wet lands, first thoroughly to drain, and, if flat, to ridge them. The farmer who undertakes to raise all kinds of crops upon one kind of soil, misapplies his labor. He had better confine himself to those which make the best return, sell the surplus, and buy with a part of the proceeds that for which his neighbor's soil is better

adapted than his own. If his land will yield per acre twenty-five bushels of wheat, and only twenty-five of corn, he had better raise more wheat and buy his corn; for his corn costs him double what his wheat crop does: and is, withal, but a little more than half as valuable. If it will not produce good barley, let him forego the culture of that grain, and if his situation is near market, he should raise more grain, vegetables and fruit, and less stock.

The expense of transporting his surplus produce to market, is an important consideration to the farmer. A bushel of wheat is worth to the grower in Chenango, less than to the grower in Albany, by the expense of its transportation to market, which may be two shillings, or twenty-five per cent. A bullock, on the contrary, may be as profitably fattened by a farmer in Otsego as one in Westchester, the expense of driving him from Otsego to New-York being counterbalanced by the enhanced value of his feed, and of the land which produces it, in Westchester. Upon the banks of the Hudson a bushel of potatoes is worth from two to four shillings; while their value, for market, in the interior, is scarcely half this; because they will not bear distant transportation, and find a precarious market at home. While again, the wool, cheese, butter, cattle, horses, hogs and sheep, from the hills of Delaware or Lewes, from the cheapness of conveyance or transportation of these articles, and the relative cheapness of lands, are able to compete successfully in the market, with like products from the counties of Dutchess and Orange.

From this view of the subject it would seem to result, as a general rule, that farmers contiguous to markets or navigable waters will best consult their interests, by confining their labors, so far as regards their marketable products, to tillage crops, hay and fruits; and that it would comport with the policy of those more remote, to rely upon cattle and sheep husbandry as the main source of wealth. These suggestions derive force from the wise provisions of Providence, in adapting the valleys to grain, and the hills and mountains to the subsistence of flocks and herds. B.

We mentioned a few weeks since the invention of a machine for cleaning rice from the hull, by some ingenious mechanics of this town. At that time the trial of its capacities had hardly been tested fairly, as it was not perfected in all its parts nor its exact powers graduated. Within a few days, however, a machine has been completed, and all the improvements which experience had suggested been done, and a trial of its powers made in the presence of a large number of our citizens. It performed its task to the admiration of all, and goes by horse, steam, water or any other power. It works rapidly, cleans the rice in the best possible manner, without, as has been the leading difficulty with all other machines, *reaking up the grain*.—*Northampton Cour.*

New manufacture.—A new article of commerce namely, East India Flour, is coming extensively into use, for the making of size and starch; it is chiefly imported by the Calcutta Flour Mill company, and is found to answer better than American flour, which has hitherto been considered the best for this purpose.—*English Paper.*

No man ought to be contented with any evils which he can remedy by his own industry and exertion.

A DISCOURSE

Delivered before the Massachusetts Horticultural Society, on the Celebration of its fourth Anniversary, October 3, 1832.

By THADDEUS WILLIAM HARRIS, M. D.

[Continued from page 213.]

INSECTS are profusely scattered over vegetation. Several kinds are often found upon one plant. Leaves, blossoms, and fruits are alive with them; the branches and trunks afford concealment and nourishment to thousands of intestine enemies, and the roots are sapped and destroyed by them. Our present concern is with some of those which are injurious to the kitchen and flower garden, and to the fruitery.

The products of the kitchen-garden, though formerly they received less attention than those of the field, are growing more into general favor; a result owing to the change of pursuits in a portion of our population, to the low price of farm-produce, and especially to the recommendations and example of the horticultural societies of the country, and the improvements which they have introduced.

The pea is universally esteemed one of the most palatable of our vegetables. At its first appearance in the markets it commands a high price; and its first appearance on the table is not only an object of pride to the gardener, but of pleasure to the partaker. Few, however, while indulging in the luxury of early pease, are aware how many insects they unconsciously consume. When the pods are carefully examined, small, discolored spots may be seen within them, each one corresponding to a similar spot on the opposite pea. If this spot in the pea be opened, a minute, whitish grub or maggot will be discovered. It is the insect in its larva form, which lives upon the marrow of the pea, and arrives at its full size by the time that the pea becomes dry. It then bores a round hole quite to the hull, which however is left untouched, as is also the germ of the future sprout. In this hole the insect passes the pupa state, and survives the winter; at the expiration of which, its last change being completed, it has only to gnaw through the thin hull, and make its exit, which frequently is not accomplished before the pease are committed to the ground for an early crop. Pease, thus affected, are denominated *buggy* by seedsmen and gardeners: and the little insects, so often seen within them in the spring, are incorrectly called *bugs*, a term of reproach indiscriminately applied to many kinds of insects which have no resemblance to each other in appearance and habits. The pea *Bruchus*,* for such is its correct name, is a small beetle, a native of this continent, having been unknown in Europe before the discovery of America. Early in the spring, while the pods are young and tender, and the pease are just beginning to swell, it makes small perforations in the epidermis or thin skin of the pod, and deposits in each a minute egg. These eggs are always placed opposite to the pease, and the grubs, when hatched, soon penetrate the pod, and bury themselves in the pease, by holes so fine, that they are hardly perceptible, and are soon closed. Sometimes every pea in a pod will be found to be thus inhabited; and the injury done by the pea *Bruchus* has, in former times, been so great and universal as nearly to put an end to the cultivation of this vegetable. That it should prefer the prolific exotic pea to our indigeneous, but

* *Bruchus Pisi*. L.

less productive pulse, is not a matter of surprise, analogous facts being of common occurrence; but that, for so many years, a rational method for checking its ravages should not have been practised, is somewhat remarkable. An exceedingly simple one is recommended by Deane, but to be successful should be universally adopted. It consists merely in keeping seed pease in tight vessels over one year before planting them. Latreille recommends submitting them to the heat of water at sixty-seven degrees of Fahrenheit, by which the same results might be obtained; and if this was done just before the pease were to be put into the ground, they would then be in a state for immediate planting. The Baltimore Oriole, or hang-bird, is one of the natural enemies of the *Bruchus*, whose larvæ it detects, picks from the green pease, and devours. How wonderful is the instinct of this bird, which untaught by experience, can detect the lurking culprit within the envelope of the pod and pea: and how much more wonderful that of the insect; for, as the welfare of its future progeny depends upon the succession of a crop of pease the ensuing season, the rostellum or sprout of the pea is never injured by the larva, and consequently the pulse will germinate, though deprived of a third of its substance.

Roots are undoubtedly the most important productions of the vegetable garden; and, among these the potato stands first in point of utility and value. I am not aware that it is ever very seriously injured by insects, though many appear upon its leaves. The common potato-worm has already been noticed. A small, striped beetle,* of the size and shape of that appropriated to the cucumber, is found in abundance upon the potato; and its numerous larvæ, creeping about under back-loads of filth, riot upon the luxuriant foliage. Occasionally potato patches are ravaged by two or three species of *Cantharides*, or blistering-beetles. It is only in the perfect state that they are injurious to the potato-vine, for the larvæ live in the earth upon the small roots of various kinds of herbage. Their appearance on the potato is occasional only, for they devour the leaves of several other plants. These native *Cantharides* are successfully employed in medicine instead of the Spanish *Cantharides*, and, were not the price of labor among us so high might be procured in sufficient quantity to supply the demand in the markets for this important medicinal agent. I regret to observe that the ash-colored *Cantharist* has recently appeared in great profusion upon hedges of the honey-locust,† which are almost defoliated by them. For many years past the same insects have invariably attacked the Windsor bean in the garden of a friend of mine in this vicinity. This summer they were neglected; and the consequence was, that they entirely stripped the foliage from the stalks, so that but a small and impoverished crop of beans was gathered, and the prospect of a second crop, usually obtained from the suckers after the stalks are headed down, was entirely ruined. Should the devastations of the *Cantharides* increase, it would become an object to attempt to diminish their numbers by collecting them for medical use.

I am disposed to rank the turnip, as a root, next in value to the potato. In many countries it forms a large part of the vegetable sustenance of

* *Crioceris trilineata*. Oliv.

† *Cantharis cinerea*. Oliv.

‡ *Gleditschia triacanthos*. Willd.

man and of his domestic animals. It is stated that in England, soon after the turnip appears above ground, a host of little jumping beetles, called by the farmers the *fly*,* attack and devour the seed-leaves, so that on account of this destruction, the land is often obliged to be resown, and frequently with no better success.† The consequent loss sustained in the turnip crops of Devonshire, in the year 1786, is estimated, in Young's "Annals of Agriculture," to amount, at least, to one hundred thousands pounds sterling. In the same country the caterpillar of the cabbage-butterfly‡ attacks the turnip also in great numbers. Insects allied to these are found upon the turnip in this country. The leaves, in all stages of their growth, are eaten through and through with numerous holes by a small, black, jumping beetle, a species of *Haltica*. Some of these insects infest several of our useful plants, such as the horse-radish, the mustard, the radish, the cucumber, &c. The same means for protecting these plants are to be used, because the habits of all the *Halticas* are similar. It has been recommended to sow a quantity of radish seed with the turnip seed; for the jumping beetles are found to be so much more fond of the radish than of the turnip leaf, that it will desert the latter for the former. Air-slacked lime, sifted or dusted over plants, in some instances preserves them, and sprinkling with strong alkaline solutions§ will kill the insects without injuring the plants.

The native insect allied to the European cabbage-butterfly has been already mentioned. Like its congeners, it can subsist upon many and perhaps all of the cruciferous plants, among which are the cabbage, broccoli, cauliflower, kale, radish, mustard, and turnip. It is of a beautiful white color, with dusky veins beneath the hinder wings, and in size it is larger than the small yellow butterfly of the New England States. Hitherto it has been observed only in the hilly regions of New Hampshire, and of the northern part of Massachusetts. There are two broods in a season. About the last of May and the beginning of June the white butterfly may be seen fluttering over plantations of cabbages, and turnip and radish beds, but seems to prefer the turnip leaf for the place of depositing its eggs. These are hatched between the seventh and the tenth day. The caterpillars attain their full size in twenty-one days, and are then, on an average, one inch and a quarter in length. Being of a pale green color, they are not readily distinguished from the leaves under which they reside, and upon which they subsist. When they have completed the feeding stage, they quit the plants, and retire beneath pailings, or the edges of stones, or into the interstices of walls, suspend themselves by the tail and a loop around the body, and become pupæ. This state lasts eleven days, at the expiration of which the insect comes forth a butterfly, which, during the month of August, lays the foundation for a second generation, and perishes. The caterpillars of the second brood become pupæ or chrysalids in the autumn, and re-

§ The solution may be made by dissolving one pound of hard soap in twelve gallons of the soap-suds left after washing, and it should be applied twice a day with a water-pot or garden engine.

remain in this form until the next spring. In gardens and fields infested by these caterpillars, boards should be placed horizontally an inch or two above the surface of the ground; these would form a tempting shelter for the pupæ, and render it easy for the farmer to collect and destroy them.

Another American butterfly,* originally appropriated to our native umbellate plants, has discovered the natural affinities of those of foreign origin, and made them subservient to the support of its progeny. The carrot, parsley, and celery of the garden appear now to be more subject to its attacks, than the conium and cicuta of the fields, though these troublesome and poisonous weeds are suffered to grow in unchecked abundance. This butterfly is one of our most common species; it is of large size, of a black color, ornamented above with yellow, and beneath with tawny spots; and the caterpillar, from which it proceeds, is a pale green, smooth worm, checkered with black and yellow spots. When irritated, this caterpillar has the power of projecting from the fore-part of its body a pair of orange-colored feelers, which exhale an intolerably nauseous odor, and like those of the snail, can be withdrawn and concealed at pleasure. This scent-organ is given to it for repelling its enemies, and it has, undoubtedly, made the insect known to many of you. Like the caterpillar of the turnip, this retires from the plants when fully grown, suspends itself in the same way, and, in process of time, becomes a butterfly. The only means that occur to me for destroying this insect, consist in carefully picking it, in the caterpillar state, from the plants which it inhabits. It is evident, however, that this can be done only to a limited extent; and, fortunately, it can be necessary only with respect to the parsley, for the abundant foliage of the other plants renders them less liable to suffer by the loss of a portion of it.

[To be continued.]

From the Albany Argus.

AGRICULTURAL MEMORANDA FOR 1839.

Adapted for the County of Albany.

THE last winter was remarkable for the long continuance of severe cold weather. During nearly fifty successive days the thermometer scarcely rose above the freezing point. Its influence was unprecedentedly severe upon fruit trees, destroying thousands, and seriously injuring the fruit buds of many which survived. Our peach, plum, and pear crops were consequently trifling; yet of apples there has been an ordinary yield, and cider is abundant at fair price.

As the severe cold was preceded by mild weather and snow, the ground was not frozen when it set in and the sap vessels were consequently distended with sap. The cold was so sudden and severe that it is believed the sap froze ere its volume was diminished, and that the expanding influence of the frost burst the vessels asunder. In many instances where the trees were of some size, the injury extended only to the descending sap vessels, and this sometimes but on one side of the bole; while in the other cases the sap vessels in the alburnum appeared to be ruptured, and the vitality of the plant destroyed. I had several trees which put forth their foliage, bore fruit, and appeared to be healthy till towards autumn, when their leaves became yellow and prematurely fell. On examination, I found a ring of bark about where the surface of the snow

had lain, completely dead and separated from the trunk. The fruits which suffered most were the peach, pear, apricot, and quince. What renders this circumstance more singular are the facts, that many tender trees, as the ailanthus, catalpa, &c. which dropped their foliage early, and had probably assumed their winter habit, suffered less than in ordinary winters; and that the injury, to all, was far less severe upon clay than upon sand soils.

Wheat suffered less from the winter than was apprehended. The crop has been a fair one, and the quality of the grain good. This staple, I am afraid will continue to decrease among us till we adopt a better system of manuring, and appreciate more correctly, the utility of a rotation of crops. This grain exhausts an ordinary soil of what I term specific food, or according to Lindley and Macaire, deposits a poison, which unfits the soil for another crop until the specific food is restored, or the poison removed.

Rye has been rather a light crop, and the grain inferior to that of common seasons.

Barley. From the high price which this grain commanded last winter, large quantities were sown and the crop has been more than a medium one.—Although the price has greatly fallen, yet I think upon our soils it still pays better than wheat. It exhausts less, and yields upon light loams about double the quantity that wheat does.

Corn, the farmer's main dependence for kitchen, barn and sty, promised very unfavorably, but finally turned out pretty well, where it escaped the early frosts, which in some districts did great injury. The wet spring did not admit of early planting, and the summer being backward, it was much later in coming to maturity than usual. There are two maxims which my experience in the culture of this crop has suggested, which I venture to recommend:—one is to plant only on manured, warm and well drained grounds; the other, to cut and stock the whole crop as soon as the grain is well glazed. An observance of the first has insured me good crops, while the second has ever saved them from the effects of autumnal frosts, and materially increased my stock of fodder. There is another suggestion which I will make in regard to this crop, and that is, to plant double the quantity of seed usually put into the ground, and to reduce the plants at the first hoeing, which will ensure a full complement of stalks in each hill. This is seldom the case in a field of corn. If we allow four to be a proper number, we shall find that in most cases there is a deficiency of one-fourth, and often a half of corn-bearing stocks in a field. There are always more or less feeble or sickly plants that never produce grain. These may be distinguished and thrown out in the weeding process. Few farmers appreciate the advantage of close planting, when the habits of the grain and the strength of the ground will admit of it. It is common to plant here at the distance of three feet each way. I place my hills at 3 by 2½. At the South, and East, it is usual to plant at 4, 5 and 6 feet. The following exhibits the difference in the number of hills, and consequently in the product of the different modes:—

| | | |
|-------------------------------|-----------|-------------|
| An acre planted at 6 ft. by 6 | will give | 1210 hills. |
| do. do. 5 by 5 | — | 1742 “ |
| do. do. 4 by 4 | — | 2722 “ |
| do. do. 3 by 3 | — | 4840 “ |
| do. do. 3 by 2½ | — | 5808 “ |

By this scale it appears that if the product at 4 feet would be 27 bushels, at 3 feet it would be 45, and at 3 by 2½; 58 bushels, or more than double the first; while the product at 6 feet would be to

that of 3 by 2½, nearly in the diminutive ratio of one to three and a half, or about two sevenths. In September I measured 33 feet (4 rods) square in the best part of my cornfield, which embraced 11 rows one way, and 13 hills the other, and contained 143 hills and 572 stalks. The corn was picked, husked, and after rejecting some half a dozen smutty ears carefully weighed. Its weight was 232½ lbs. A seventh part of this product, (33 lbs. 2 oz.) was immediately shelled, and the grain found to weigh 23 lbs. 7 oz. This, at 60 lbs. to the bushel, gave at the rate of 109 bushels per acre. The indication by measurement, was still higher, the memorandum of which I have mislaid.

Potatoes have been a bad crop, especially on moist grounds, where they generally do best. Those late planted were particularly light.

The summer having been wet and cool, Oats are pretty abundant and heavy. The increased consumption of this grain, however, has sustained the price above those of ordinary years.

Hay has been more than an ordinary crop; though it is principally manifest in recently stocked grounds. The experience of some years would seem to strengthen the opinion, that the practice of keeping grounds in perpetual meadows, is manifestly bad so far at least as profit is concerned. Grasses do and will alternate; the cultivated or finer kinds will run out; coarse kinds and mosses will come in; the sole of the grass will become thick and tough, and impervious to heat, air and the other agents of vegetable nutrition. Meadows begin to deteriorate, generally, the third or fourth year after they are laid down, and by the sixth, their product is often diminished to one-half, or one-third of a fair crop. New meadows ought to average 3 tons of hay per acre; old ones seldom exceed half that quantity.

The productions of the garden have been abundant, with partial exceptions. On account of the backwardness of the season, which retarded vegetation two weeks later than usual, the grape did not ripen well, and the hardier kinds, which were left uncovered, suffered severely from the winter. Sulphur is successfully applied, in a dry state, to this fruit about Boston, to prevent mildew. Melons like most other vegetables, came on late; and but few that ripened well were eaten, on account of the Cholera.

On the whole, the products of the soil have been abundant, and afford great cause of gratitude and thankfulness, to the beneficent God of the harvest.

THE MONARCH OF THE WOODS.

A few weeks ago we accompanied a friend on a visit to Upper Darby Township, Delaware county, where we were shown a large chestnut tree, on the plantation of Jonathan Owen, the circumference of which, three feet from the ground, was thirty-two feet seven inches. The tree was at the time full of chestnuts. We remember having seen the large walnut tree that was exhibited in this city a few years since, the dimensions of which we forget, but do not think it was so large as the tree on Mr. Owen's property. The poet has truly said,

“That Nature revels in the land that's free,
And here her greatness shows, in man, in stream, and tree.”

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JAN. 23, 1833.

FARMER'S AND GARDENER'S WORK FOR JANUARY AND FEBRUARY.

PROVIDE a sufficient quantity of bean poles and pea rods, which you may preserve in a corner of your wood house, or other place suitable for your purpose. Many people, who neglect to procure these implements in season, are induced by the hurry of business, to permit their peas and beans to trail on the ground, in which situation they will not produce, especially the tall growing sorts, one third part so many as they would if they were properly supported by poles and rods. The length of your pea rods should be in proportion to the sorts of peas for which you intend them. The same kinds of rods, which the tall growing peas require, will answer for the generality of running kidney beans. The Lima beans will need strong poles from 8 to 9 feet high.

Manure may be carried into those places where it is needed, if the frost will permit, left in a heap, but not spread. Wherever and whenever the snow is off the ground, rake together and burn the rubbish of last year's crop. Inspect and repair your fences, rub or thrash out and clean seeds. See that your garden tools, &c. are in good repair, and procure such new ones as may be necessary. Prepare materials for hot beds. Attend to your fruit in your fruit room or cellar, on shelves or in boxes, and if necessary pick it over and cull whatever may be defective.

For the New England Farmer.
HORTICULTURE.

EXTRACT of a letter from a lady in Brooklyn, New York, upon the effects of Horticultural pursuits.

I perfectly coincide with your excellent opinion, which you mentioned in your kind letter, that horticultural tastes have a very great tendency to improve the mind and refine the manners, for I have invariably noticed that I never saw an ill natured person embellish his residence, and taking pleasure in cultivation.

For the New England Farmer.

SIR,—Observing in your paper of the last week, a request from a correspondent at Dunstable, in regard to a tumor on the face of a valuable ox; as far as I am able to answer his inquiries, I feel a pleasure in doing,—although the description he has given of the nature of the disease is not such as to lead to any definite opinion.

The term holdfast, is one of those which is not described in any work on the diseases of horned cattle, nor can it be relied upon as one of sufficient evidence of any specific disease.

Cattle are liable to tumors of various kinds, and on various parts of the body, but before we can with safety, or any degree of certainty, prescribe any plan of treatment, it is necessary for us to know their exact nature.

If your correspondent will inform me through your paper or otherwise, of the situation, and nature of that which he describes as a holdfast, I will endeavor to prescribe a remedy for its re-

moval. It is necessary to know whether it is a boney or soft tumor, and whether it has the appearance of containing matter or not.

Respectfully yours, &c. T. H. SMITH.

Veterinary Surgeon.

Boston, Jan. 21, 1833.

COLTS.

"We often hear it lamented, that our breed of horses is so bad. But I am convinced that as our colts are managed if we had any other breed we should soon make it appear to be as mean as our own if not worse. The abusing of colts in the first winter, is the principal cause of their proving so bad. For our farmers seldom allow their weaned colts any food besides hay, and that is not always of the best kind. So that they seldom fail of being stunted in their growth in the first winter to such a degree, that they never get the better of it. A colt that is foaled late, should not be weaned till February or March, and should have oats during the whole of the winter. In some countries they allow a young colt fifteen bushels. We need not grudge to feed them with meal, oats and bran, besides the best of clover hay; for they will pay for it in their growth. After the first winter, they will need no extraordinary feeding till they are grown up. Were the above directions observed, we should soon see an improvement of our breed of horses. They would be capable of doing much greater service, and be likely to hold out to a greater age."—Deane.

ITEMS OF INTELLIGENCE.

A Monument to Washington. There has been a late meeting in New York for the purpose of erecting a Monument in that city to GEORGE WASHINGTON, in which it was determined to petition the legislature for an act to incorporate an association for that purpose.

Resolutions have been introduced into the Kentucky Legislature denouncing nullification.

Symptoms of Discord. It is said that the great and little folks at Washington look askance and stand aloof; and that the form and substance of social intercourse are threatened with nullification in consequence of the belligerent attitude of South Carolina, and matters and things thereunto appertaining.

The Pennsylvania Legislature printed five thousand copies of the President's Proclamation against nullifiers, &c. in English, and three thousand in German.

Lyceums. According to a late number of the Family Lyceum there have been Lyceums founded, which are now in successful progress, in Virginia, Tennessee, Kentucky, Indiana, Ohio, Illinois, Missouri, Louisiana, North Carolina and Mississippi States:

Nullifiers. The New York Standard states that many letters have been received from South Carolina, which are decidedly warlike. The nullifiers are every where organizing their volunteers, arming and drilling, while the Union Party are also preparing for defence. The newspapers and

orators are more violent than ever, and every thing seems tending to open violence.

The Missionaries, imprisoned in the Georgia Penitentiary have at length been discharged.

Deaf and Dumb. The Centinel asserts that the deaf and dumb in the United States, have been ascertained to be 6112, or 1 to every 2000 inhabitants. There was an interesting exhibition lately of the pupils of the Deaf and Dumb Asylum at Hartford, in presence of the Governor, Lieut. Governor, and most of the Members of the Legislature, besides a number of ladies and others, spectators. The exhibition was conducted by Mr. Weld, who was formerly a teacher in the Philadelphia school, and since the resignation of Mr. Gauladet, has occupied his place in the school at Hartford. The exhibitions in the manual alphabet, grammar, geography, arithmetic, &c. &c. are highly spoken of. There is an instance in Philadelphia, where one of the first lithographic artists is deaf and dumb; and 12 individuals, who have left the asylum at Hartford, have become heads of families.

Fires within a week or ten days past have been numerous. On the evening of the 18th inst. about 10 o'clock, a fire broke out in a carpenter's shop in Portland Street, Boston, which for a time threatened very serious consequences; but after destroying several shops and small ten feet buildings, it was at length extinguished by the great exertions of the Firemen of Boston, Charlestown, Cambridgeport and Roxbury. On the same evening, and while the Fire Department were at work, an incendiary was arrested in the cellar of the grocery store of Mr. Clement Willis, corner of High and Federal Streets, while collecting combustibles for the purpose of setting fire to the building over the cellar. On the morning of the 19th inst. a fire broke out in the sugar house in Atkinson Street, owned by E. T. Andrews, Esq. and recently occupied by Mr. Ephraim Hall, which was consumed.

Two steamboats were burnt on the 4th inst. at N. Orleans.

Money, on first rate securities, is only two per cent, per annum, in London. This very low rate of interest is submitted to because capitalists cannot be induced to vest their money in stocks, in the present unsettled state of politics.

SWIFT TRAVELLING.

THE "Experiment," the new engine lately put upon the Mohawk and Hudson Rail Road, performed on the 24th ult. the distance from the head of the plane to the half way house, in 12 minutes, which is at the rate of 35 miles an hour. This is, says the Schenectady Whig, the fastest travelling which has yet taken place on the road.

A gentleman who lately crossed from New Castle to Frenchtown, states that the trip was performed in 47 minutes, or at the rate of 21½ miles an hour! This was considered about the ordinary speed of the vehicle at a full load.—Genesee Farmer.

Large Beets. Mr. John Fuller raised in his garden, in Hume, Alleghany County, the season past, four beets that weighed 71 pounds, the lightest 15 pounds, and the heaviest 23 pounds measured 2 feet 10 inches in circumference.—*ibid.*

From Manchester to Birmingham, with the exception of the coal regions of Wolverhampton, and another few miles of poor land the whole country is a garden. An American farmer knows nothing of English husbandry. The difference is too wide for him to be able to appreciate it. Select the most cultivated ground of the rich soil on Manhattan Island, or behind Brooklyn, or in the immediate vicinity of Philadelphia, or of Boston—and they are only ordinary specimens of English farming.—*English paper.*

Slaves. The following may be looked upon as a tolerably correct estimate of the number of human beings held in slavery:—British Colonies 800,000; French Colonies, 200,000; Cuba and Porto Rico, 500,000; other Foreign Colonies, 75,000; United States, 1,650,000; Brazil, 2,000,000. Total 5,225,000.—*ib.*

Aristocratic Wealth. It is said that the vast estates of the Duke of Buccleuch (supposed to be worth £250,000 annually) produce his grace a greater income than is the privy purse of the king, the allowance to the queen, and the salaries of the great officers of the household.—*ib.*

Good Fruit. The price of good fruit was fixed by Deity himself, when he created man and placed him in the garden of Eden. Even then and in that virgin soil the condition was that he "dress the garden and keep it;" and one may venture to say, that since then the price has never been abated.
T. MATLACK, Esq.

Ostrich Eggs. These will sometimes weigh about three pounds. They are reckoned a delicate article of food, and are dressed in various ways for the table. Owing to the thickness and strength of their shell, they are easily preserved for a great length of time, even at sea, and without the trouble of constantly turning them. At the Cape of Good Hope they are usually sold for about sixpence a piece, and from their large size, one of them will serve two or three persons for a meal.

FOR SALE,

THE Bull COLLINS, got by Bolivar—dam Young Flora, by Celebs; Granddam the imported Cow Flora—dropt Aug. 30, 1829—colour red and white. This Bull is one of the finest animals in America, and will be sold low. Apply at this office.

MISCELLANY.

THE PETITION.

UNBAR the door—the rain pours fast—
 'The storm is howling wildly!
 Take pity on the poor outcast—
 Look on his miseries mildly;
 Relieve misfortune's lowly child—
 Give pleasure for his sorrow;
 Oh say—(for once his day beams smil'd)
 Be thine a cheerful morrow.

Unbar the door—chill blows the wind—
 The heath looks bleak and dreary;
 Be kind to him—who e'er was kind
 To wretches worn and weary!
 Ah! once a brighter day was mine—
 And friends to aid were pressing—
 Friends fled with fortune! give, and thine
 Be every earthly blessing!

THE REPLY.

WHAT voice so weak and plaintively
 Sues at the Woodman's door?
 Who braves the storm, who bows the knee,
 A suppliant sad and poor?
 Thy prayer's allowed, come child of wo,
 Come enter freely here;
 Forget thy wretched lot—forego
 The soul subduing tear.

If thou art friendless, if no heart
 Of grandeur's dazzling form,
 Solace'd nor bade the clouds depart,
 Nor cheer'd the gathering storm,
 If thou a mother's cheering voice,
 A father's fostering care
 Hast early lost—still, still rejoice,
 Life's bud defies despair!

Though here no tapestry is seen—
 No labored anthems swell;
 Yet nature rob'd in mountain green,
 Here pleas'd delights to dwell;
 Too humble for the court of kings,
 Here scattering leaf and flower,
 Content a wreath dress'd beauty brings,
 An offering for each hour.

From the Library of Entertaining Knowledge.
DOGS.

WE cannot quit the subject of dogs without advert-
 ing to that lamentable circumstance, their oc-
 casional madness. This disease is not common
 to dogs in all climates; according to Mr. Barrow,
 canine madness is unknown in South Africa.
 Other temporary diseases are oftentimes mistaken
 for this fearful malady; and we, therefore, subjoin
 the symptoms of hydrophobia, as described by
 M. M. Chaussier and Orfila, who have written a
 scientific work on this disorder:—

"A dog at the commencement of madness is
 sick, languishing, and more dull than usual. He
 seeks obscurity, remains in a corner, does not
 bark, but growls continually at strangers, and,
 without any apparent cause, refuses to eat or drink.
 His gait is unsteady, nearly resembling that of a
 man almost asleep. At the end of three or four days,
 he abandons his dwelling, roving continually in
 every direction: he walks or runs as if tipsy, and
 frequently falls. His hair is bristled up; his eyes
 haggard, fixed, and sparkling; his head hangs
 down; his mouth is open and full of frothy slaver;
 his tongue hangs out, and his tail between his
 legs. He has, for the most part, but *not always*,
 a horror of water, the sight which seems, general-
 ly, to redouble his sufferings. He experiences

from time to time transports of fury, and endeav-
 ors to bite every object which presents itself,
 not even excepting his master, whom indeed he
 begins not to recognise. Light and lively colors
 greatly increase his rage. At the end of thirty
 or thirty-six hours he dies in convulsions." After
 various remedies for this terrible malady have been
 tried in vain, it seems now agreed that cutting or
 burning out the bitten part is the only one to be
 relied on.

NEGLIGENCE.

INATTENTION to small matters brings with it
 often a succession of losses. The following nar-
 rative by the celebrated Say, in his "Essay on
 Political Economy," illustrates this truth in a very
 satisfactory manner. "I remember," says this
 writer, "when I was in the country, witnessing an
 instance of the losses to which a household is ex-
 posed by negligence. For want of a latch of
 trifling value, the gate of the farm-yard which
 opened into the fields was often open. Whoever
 went out pulled the gate after him; but as there
 was no means of shutting it, this gate was always
 ajar. Many of the farm-yard animals had been
 on this account lost.

"One day, a fine young pig got out and reached
 the neighboring wood. All were immediately in
 chase of the animal. The gardener was the first
 who got sight of it; and he, in jumping over a
 ditch to stop its further passage, received a dan-
 gerous wound, which confined him to his bed for
 a fortnight. The cook found on her return from
 the pursuit, that the linen which she had left at
 the fire to dry, was burnt; and the dairy maid
 having left in a hurry the cow-stable without
 fastening the animals in it, a cow in her absence
 broke the leg of a colt which they were raising in
 the place. The days lost by the gardener were
 worth twenty crowns; the linen and colt were as
 valuable. Here then in a few minutes, for want
 of a fastening which would have cost a few cents,
 a loss of forty crowns was encountered by persons
 whose duty it was to exercise the most rigid econ-
 omy, without our taking into account the suffer-
 ings caused by the disease or the uneasiness and
 other inconveniences in addition to the expense."

A SEED FARMER.

AN honest son of Erin, who had saved money
 enough by his industry to purchase a small farm
 undertook to manage it himself. He accordingly
 bought his seeds at a seed store, and planted them
 all done up in papers—just as they came from the
 store. A bystander who observed him, began to
 laugh at him, and told him he was doing wrong.
 "Ah, let me alone for that," said Pat, "I am making
 a seed garden; did ye never see seeds grow all
 papered and labelled just as they sell them in the
 shop?"

SOMETHING CERTAINLY NEW UNDER THE
 SUN.

NEARLY opposite our office there are exhibited
 by W. C. Palmer, M. D., two *novelties*.

1st. A cot for invalids, which by means of a
 gum elastic reservoir filled with water, beneath
 the bed or mattress—actually places the sufferer
 upon a bed of water, which being displaced at
 every movement affords ease, and respite, and
 change of position to the worn and wearied
 frame. It seems to us a capital invention.

2d. A gum elastic bathing cot which folds up,
 and is as portable as any ordinary cot and therefore

is easily transferable from room to room, as needed;
 and which with less water than is requisite in
 ordinary bathing tubs, insures an excellent bath.
 We commend these really useful *gimcracks* to public
 attention.—*Detroit Journal*.

Marriage Ceremony Extraordinary. On Monday
 last a woman without arms was married at Bury;
 the ring being placed by the bridegroom upon one
 of the bride's toes. [This indeed is taking a wife
 in *toe-toe* "for better, for worse."]

Longevity. Died, at Columbia Co. Geo. Capt.
 Thomas Cobb, aged 120 years! He was a Captain
 under Washington, and marched against the forts
 on the Kenhawa, then in possession of the French
 and Indians, several years before the defeat of
 Braddock. When 100 years of age he frequently
 rode 45 miles in one day; and only 4 years ago
 he rode to Augusta, 40 miles one day.

Curiosity. The proprietor of a coffee house in
 Paris, has offered Mademoiselle Boury, the young
 woman who is said to have turned aside the pis-
 tol levelled at the King, 40,000 francs to serve as
 bar maid for six months.

Steam-boat Accident. One of the flues of the
 steam boat Scotland, collapsed between Memphis
 and Natchez, and killed one man, and severely
 scalded three others.—*Louisville Herald*, 17th inst.

EASTMAN'S STRAWCUTTER.

FOR Sale cheap—one of Eastman's STRAWCUTTERS, new
 in November, a perfect machine and in good order, not having
 been used more than a dozen times. It will be sold cheap, or
 exchanged for neat stock. Inquire of KENDALL BROS.,
 Saddler, Roxbury Street, near the Boston line. jy 16

MADDER SEED.

THE Subscriber has for sale 50 Bushels of MADDER SEED,
 so called, consisting of a small portion of Top Root, with the
 buds attached to it; the yield is immense; it is dug once in 3
 years. The culture simple and the plant perfectly hardy. Di-
 rections will be given to all who purchase—price from four to
 six dollars per bushel. Quantity of seed to plant an acre, from
 four to five and a half bushels. Time for planting, fall and
 spring. The subscriber is preparing eight acres for planting—
 Orders enclosing the cash will meet with prompt attention—
 a sample of the article may be seen in the hands of Mr. JESSE
 WINSLOW, Newton, Upper Falls, Mass.

RUSSEL BRONSON.

Bridgewater, Oneida Co. N. Y. Jan. 3, 1833.

BOSTON, WEDNESDAY EVENING, JANUARY 29, 1834.

NO. 29.

HYMN.

THE following hymn, by L. M. SARGENT, Esq. was sung at the anniversary meeting of the Howard Benevolent Society in Boston on Wednesday evening, January 15th.

God of the rolling year—thy power
Expands the germ; unfolds the flower;
Matures, at last the golden grain;
And then restores the iron reign
Of dreary winter, drearier still
To those whom age and penury chill.

Thy power of frost has locked the ground,
And streams in icy chains are bound;
Spare thou the heart of man below,
And bid the fount of pity flow.
Speed, Lord, thy backward stewards on,
Till mercy's holy work be done.

The board with costly viands spread,
The blazing hearth, the downy bed;
God, thou art just;—what mortal dare
Call these his own, for thine they are!
Speed, Lord, thy backward stewards on,
Till mercy's holy work be done.

The hand that won the orphan's bread,
Is laid to slumber with the dead;
The barefoot boy, 'mid winter skies,
From door to door his labor plies.
Speed, Lord, thy backward stewards on,
Till mercy's holy work be done.

Loud howls the storm, 'tis cold and late,
The shivering outcast tries the gate;
The backward steward of the poor
Turns down his light, and bars the door.
Speed, Lord, thy backward stewards on,
Till mercy's holy work be done.

COMMUNICATIONS.

For the New-England Farmer.

ORNAMENTAL TREES.

It is remarkable that notwithstanding the rapid progress which Horticulture is making in the United States, so little attention is paid to the planting ornamental trees, with a view to the embellishment of our country residences. The magnificent Parks of England, have been long and justly admired, as constituting one of the most beautiful features of that highly cultivated country; and although the horticultural creations of our more limited means, may never equal in extent and grandeur some of those of the aristocracy of Europe, yet every person of cultivated mind, is aware, how beautiful the hand of taste can render even very limited scenes, by the proper application of the principles and materials necessary to mental pleasure and gratification.

Considered in a single point of view, what an infinite variety of beauty there is in a tree itself! Every part is admirable, from the individual beauty of its leaves, to its grand effect as a whole. Who has not witnessed in some favorite landscape, the indescribable charm thrown over the whole scene by a single tree? Perhaps a huge giant, whose massy trunk and wide out-stretched arms have been the production of ages; or the more graceful form of another whose delicate foliage reflects the sunbeam, and trembles with the slightest breeze that passes over it. There is no monotony in nature—even in trees, every season has its own

charms. Spring, the season of renewed life, witnesses the rush of the newly imbibed sap—the buds swell—the tender leaves unfold, and the admirer of nature is delighted by the freshness and vividness of the young foliage. Summer comes—he is refreshed by the fragrance of their blossoms—their shade is a welcome luxury in the noontide sun—perchance their fruit may be an acceptable offering to the palate, and who in this country has not witnessed the autumnal glories of an American forest?

There is no country of the globe which produces a greater variety of fine forest trees whether considered for the purposes of ornament or timber, than North America. Yet it is a fact that for both these purposes, more particularly the first, they are Horticulturally better known in many parts of Europe, than they are now at home. Those governments have imported the seeds of all our most valuable forest trees, annually, for more than a century. Instead of planting, our agriculturists have hitherto been engaged in destroying. In the Atlantic States, this period is now past; and we would, therefore, first direct the attention of the arboriculturist to our own trees.

There is not in the whole catalogue, scarcely a more interesting object than an immense oak tree, when placed so, as to be considered in relation to the large mansion of a wealthy proprietor. Its broad ample limbs and aged form, give a very impressive air of dignity to the whole scene. It is a very common inhabitant of our woods, there being 44 species of indigenous growth between the 20th and 48th degrees of north latitude.* The pendulous branches of the American Elm—the light foliage of the Birch—the cheerful vernal appearance of some of the species of Maple—the delicate leaf of the Locust, and the heavy masses of verdure produced by the Beech, are sufficient to render them all ornamental in Park scenery, and they should ever find a proper situation in an extensive lawn. Our American poplars should be recollected when a rapid growth and immediate effect is required. *Gleditsia triacanthos* or the sweet locust, is interesting from its long masses of thorns. One of our most ornamental trees, both in foliage and flower is the white wood *Liriodendron tulipifera*. Its erect, tall form, large yellow blossoms, and handsome leaves, have rendered it an universal favorite in Europe, and there can scarcely be a more stately object to stand as an isolated specimen. The plane or sycamore (*Platanus occidentalis*) is too much neglected because it is so common; but in favorable situations, in deep soils, and where ample room is afforded, it produces a noble tree of immense size. Several have been measured on the banks of the Ohio from 40 to 50 feet in circumference.

A native tree but little known in our ornamental plantations, is the Kentucky coffee *Gymnocladus canadensis*. It is a native of Kentucky and Tennessee, grows to the height of 40 feet, and its doubly compound foliage, and very singular appearance when defoliated in the winter months, are well calculated to render it an interesting feature in the landscape. *Cupressus disticha* (*Taxodium Richd*) the deciduous Cypress, flourishing in

vast quantities in the southern parts of the Union, is, though perfectly hardy and of easy cultivation, but little known in the Northern States.* Its beautiful light green foliage contrasts elegantly with the denser hue of other deciduous trees, and we are hardly aware of an upright growing tree, better calculated to give variety of color to groups and masses, than this. *Catalpa syriaca* is a most striking ornament to a lawn, when in the summer months it is loaded with its large clusters of parti-colored flowers.

But the most splendid, most fragrant, and most celebrated ornamental production of the woods and forests of our country, is yet to be mentioned. It is the unrivalled *Magnolia grandiflora*, the most magnificent of the genus, a beautiful tree of 70 feet in its native soil, only attains the size of a large shrub in the Middle States, and will scarcely withstand the winters of the Northern. But *M. acuminata* though not so beautiful, is a fine large tree, sometimes attaining the height of 90 feet. It is abundant in Western New York and Ohio. *M. macrophylla* is not only remarkable for the beauty of its flowers, but also for the extraordinary size of its leaves; they having been measured so long as 3 feet. *Magnolia tripetala*, the umbrella tree, is also a fine species growing in districts from Georgia to New York:—its large cream-colored flowers measure 7 or 8 inches in diameter. Still more rare though highly ornamental, are *M. cordata* and *M. auriculata*; small trees which ought to be indispensable to every collection. The species of smallest stature and most frequent occurrence in the Middle States is *M. glauca*, the flowers of which are highly odoriferous. It succeeds best in damp soils, and is found very plentifully in situations of this kind in New Jersey.

Ornamental trees from other countries should find a prominent place in the plantations of our Horticulturists. They not only have an intrinsic value in themselves, but to a refined taste they offer gratifications from the associations connected with them. Thus the proprietor may view in the walks over his grounds, not only productions of his own country, but their fellows from many other climes. We may witness flourishing upon the same soil, many of the productions of southern Europe and Asia; individuals from the frigid regions of Siberia, and the almost unknown forests of Patagonia; vegetables which perseverance has abstracted from the jealous Chinese, and which the botanical traveller has discovered among the haunts of the savage Indian.

Among the foreign trees which are most generally cultivated for ornament in this country, we may mention the two genera of *Tilia* and *Æsculus*. The European Lime or Linden tree, with its fine stately form and fragrant blossoms, is a most pleasing object as an ornamental tree. The Horse chestnut (*Æ. Hippocastanum*) is perhaps better known than any foreign tree in the country; its compact growth, fine digitate leaves, and above all, its superb, showy flowers, distributed in huge bouquets over the foliage, have rendered it here, as in Europe, an object of universal admiration. We would here beg

* We have seen a celebrated specimen in Col. Carr's garden, Philadelphia, 180 feet high, 25 in circumference, and 91 years old.

* Michaux.

leave to direct the attention of planters to the less known, but not less interesting species of this tree, natives of our own soil. *Esculus paiva* producing red, and *E. flava*, yellow flowers, form very beautiful trees of moderate size. The other species are rather large shrubs than trees, and are very pretty ornaments to the garden.

The brilliant appearance of the European Mountain Ash (*Sorbus aucuparia*) when in autumn it is densely clad with its rich crimson fruit is a circumstance sufficient to give it strong claims to the care of the arboriculturist, independently of the beauty of its foliage. But a tree, which from this latter property has long been a favorite with us, and which, though it is common in Europe, we regret to say is yet but half so well known as it should be, is the silver leaved Abele, *Populus alba*. Its growth is very rapid, and it is, therefore, well adapted for planting where time is an object of consideration. The flowers are insignificant, but its leaves are highly interesting. The under side of each of these is rendered perfectly white by a dense cottony pubescence, and in a gentle breeze from their being supported on slender petioles they are in constant motion. At a moderate distance to a spectator standing on the windward side, they give it frequently the appearance of being covered with a profusion of white flowers. It has a beautiful effect from the house when seen at some distance in the foreground of a handsome group of trees of a darker green. Added to this, it holds its foliage unscathed by the frost, until the very latest period in Autumn.

Ailantus glandulosus, the heaven tree of the Chinese, is a fine stately tree, and though introduced from a warmer climate, bears the intense cold of our winters perfectly uninjured. When young it somewhat resembles our sumach, but when it attains the height of 90 or 100 feet, with its long pendant pinnated foliage, it will form a very picturesque and graceful object.

We must not forget in this brief notice the Larches both of Europe and our country. *Pinus larix* has long been considered among the first timber trees of the other continent. The singularity of its foliage as a deciduous tree, its long, declining branches and drooping spray, are well calculated to give variety to the landscape, and we are happy to see, that both this and our two American species, *P. microcarpa* and *P. pendula* are becoming more generally objects of attention and cultivation.

Among the interesting trees of more recent introduction and which are yet rare in this country, we may mention *Salisburia adiantifolia*, the Japanese maiden hair tree. The foliage is strikingly singular and beautiful, resembling that well known fern *Adiantum pedatum*, and the tree appears to be very hardy. The purple beech, a variety of *Fagus sylvatica*, is a very unique object with its strangely colored leaves, and a very splendid tree lately introduced from the banks of the Missouri and Arkansas is the Osage orange (*Maclura aurantiaca*). Its vivid green leaves and rapid growth are already known to us, but it is described as being a tree in its native soils of thirty or forty feet in height, and bearing abundance of beautiful fruit of the size and appearance of an orange. The weeping ash is also a very unique and desirable object, and its long seemingly inverted shoots may be introduced in some situations with an excellent effect.

We have often regretted that in decorating the grounds of country residences so little attention is paid by the proprietors to hardy evergreen trees.

Ornamental at any season, they are eminently so in winter—a period in this latitude when every other portion of vegetable matter yields to the severity of our northern climate, and when those retaining their coats of verdure uninjured are beautiful and cheerful memorials of the increasing vitality of the vegetable world. Deciduous trees at this season present but a bleak and desolate aspect—a few evergreens, therefore, interspersed singly over the lawn or tastefully disposed in a few groups so as to be seen from the windows of the mansion, will give a pleasing liveliness to the scene which cannot fail to charm every person. We would earnestly advise every person engaged in ornamental planting to transfer some of our fine native evergreen trees to their lawn, park or terrace. We are aware that many think that there is great difficulty in transplanting them with success, but experience has taught us that with the following precautions no more difficulty is found than with deciduous trees. In transplanting choose the spring of the year at the time the buds are swelling: cut as few of the roots as possible, and do not suffer them to become dry before you replace them in the soil. Among our most ornamental evergreen trees may be mentioned the different species of Pine, natives of N. America. Several of them are fine stately trees, and one which is particularly ornamental as a park tree is the white or Weymouth pine, *Pinus strobus*. *Pinus rigida*, when old and large is a very picturesque tree; and *Pinus alba rubra et fraseri*, the white, red and double spruce firs, are trees of moderate size, very generally diffused in the middle states and easily obtained. The well known balsam fir, *Pinus balsamea*, is such a beautiful evergreen, and succeeds so well in this climate that it should find a place in the smallest plantations. We have observed it thriving well even in confined spaces in cities. *Thuja occidentalis*, the arbor vitæ, is a very interesting tree, and as well as the exotic *T. orientalis*, will be considered very ornamental in districts where it is not common.

Among the most ornamental foreign coniferous trees, we will notice the Norway spruce, the drooping branches of which in a large specimen are so highly admired—the well known Scotch fir, the finest timber tree of Europe, celebrated for growing on thin soils; and the beautiful silver fir, *Pinus picea*; all of them are noble trees, and as they can be readily procured at the nurseries should be found in the grounds of every country residence.

Several other species of this genus are thought the most beautiful trees of Europe, unfortunately yet scarce in this country. The stone pine, whose seeds are a delicious fruit, and whose "vast canopy supported on a naked column of immense height, forms one of the chief and peculiar beauties in Italian scenery and in the living landscapes of Claude," and the not less interesting *Pinus pinaster* and *P. lembra* of the mountains of Switzerland. But the most desirable evergreen tree which flourishes in temperate climates is the classic cedar of Lebanon, *Pinus cedrus*. Its singular ramose branches and wild picturesque appearance in a large specimen, give a more majestic and decided character to a fine building and its adjacent scenery than any other tree whatever. It is a native of the coldest parts of Mt. Libanus, but according to Professor Martyn more trees are to be found in England at the present time than on its original site. As it is scarcely yet known as an ornamental tree in this country we certainly do not know

of any object better worth the attention of the arboriculturist.

We observe in foreign periodicals that several magnificent hardy individuals belonging to this section of trees have been lately introduced into Europe, and we hope before long they will find their way to the hands of our cultivators. Among the most remarkable we may mention a splendid new genus of pine (*Pinus lambertiana*) lately found in Northern California. The discoverer, Mr. D. Douglass, botanical collector to the London Hort. Soc., describes it as growing from 150 to 200 feet in height, producing cones 16 inches in length. He measured a specimen 215 feet long and 57 in circumference.* Several other specimens of this genus, of much grandeur and beauty, are but lately introduced into cultivation, and which our present limits will barely permit us to enumerate. *Pinus Douglasi*, *P. monticola* and *P. grandis*, are immense trees from the Northwest coast of America, *Pinus deodora* from Himalaya, *P. taurica* from Asiatic Turkey, and *P. lasio*, from the mountains of Corsica are spoken of as being highly ornamental. *Juracaria imbricata*, a beautiful evergreen tree of South America, and *Cupressus pendula*, the weeping cypress of the Chinese, are extremely elegant—are found to withstand the climate of Britain, and would probably also endure that of this country.

We cannot close these remarks without again adverting to the infinite beauty which may be produced by a proper use of this fine material of nature. Many a dreary and barren prospect may be rendered interesting—many a natural or artificial deformity hidden, and the effect of almost every landscape may be improved simply by the judicious employment of trees. The most fertile countries would appear but a desert without them, and the most picturesque scenery in every part of the globe has owed to them its highest charms. Added to this, by recent improvements in the art of transplanting the ornamental planter of the present day may realize almost immediately what was formerly the slow and regular production of years.

A. J. DOWNING.

Newburgh, N. Y.

For the New England Farmer.

CHINESE MULBERRY.

T. G. FESSENDEN, Esq.—Dear Sir, I observe with much pleasure that the Chinese Mulberry, or Morns Multicaulis, has engaged the attention of Mr. Kenrick of Newton, an enlightened and enterprising cultivator of trees and plants. The essay on Silk and the Chinese Mulberry recently published by him will contain much valuable information on these highly interesting articles. I wish to speak emphatically respecting a branch of industry which, if the people of New England are true to themselves, in a few years will be annually rewarded with some millions of dollars. It is probable, in my estimation, that more than half of the hands that would be employed in this branch of industry would otherwise be idle and unproductive. Instead of sending ten millions of dollars annually out of the country, more than half of this sum might be annually saved, and far more profitably saved than if obtained without industry or bestowed as a gift. I know of no enterprise in my judgment more deserving of the attention of our State Legislature than the culture of the Mul-

* Trans. Linnean Soc. v. 15, p. 497.

† Vide Sir Henry Stewart on Planting.

berry and the manufacture of Silk. The enterprise of the little State of Connecticut in this branch is already making her rich and beautiful and great.

The Chinese Mulberry trees, of which I gave some account in the N. E. Farmer of the 15th inst. as I then stated were procured of Mr. Prince of Long Island in the spring of 1831, the preceding winter having been severe and destroyed trees in different parts of the country. The winter of 1831-2 was still severer and destroyed many more. I am not certain which of the winters destroyed the beautiful young orchard in Billerica. But of this I think there can be no doubt, that in consequence of its extremely rapid growth and tenderness it was destroyed. It was planted in a dark, loamy soil, flat, somewhat rocky and low, and enriched by manure. Although I had a considerable number of young trees on my land I did not lose one by the winter. Mine were nearly all on a light loamy, or gravelly soil, and had not been forced to a rapid growth. My Chinese Mulberry trees having survived the severest winter, with but little injury, I impute their escape to the nature of the soil in which they were planted, and to that cause alone. In confirmation of this opinion I can add, that two of the same species, brought from Long Island at the same time, I gave to a brother-in-law, and were planted in a dark, moist, rich soil, and both, I think, were killed in the ground the same winter. One or both of them sent out their branches the next summer, grew rapidly, and produced much larger leaves than mine produced.

Whether this be the same species of Mulberry exactly as Mr. Kenrick describes, I am unable to determine. Mine did not yield what I call very large leaves as they were less in length and breadth than I have seen on the common black Mulberry. But otherwise they perfectly correspond with Mr. Kenrick's description, except that some of them have a form rather shaped like the grape leaf, than that of the common Mulberry. As he describes, "they are curled or convex on their upper surfaces, of a deep, beautiful, and shining green." The leaf is thick, with the under side having a texture like rich silk velvet. If there be any doubt, whether what is called the Chinese Mulberry has, or has not, been for some time known in Europe, all I can say is, that the trees I obtained of Mr. Prince, which he assured me were the best species of the Chinese Mulberry, so perfectly correspond with that of the seedling Mulberry known in France, and described as the best species by Dandolo and Martleroy, I was led to that conclusion. My trees have sent out numerous stalks crowded with leaves, and their appearance is so rich and beautiful that no one seeing them could doubt their superior adaptedness to be converted into silk, and to yield it in abundance. These trees I purchased as articles of curiosity to ascertain their character, and their capability of being applied to advantage to the object proposed. When they shall again put forth their leaves I intend to furnish Friend Brooks of Scituate, with a quantity of them to make some proof of their value.

His having commenced the culture of silk, and invented an admirable machine for reeling and spinning it, will enable him soon to furnish some important facts to place the value of the Chinese Mulberry beyond question as to some of its essential properties. With the information I now possess, if I contemplated the culture of the article, I should not hesitate to plant this species of Mulber-

ry in preference to any other. But I should prefer light loamy, or gravelly land for it, as promising the best success. Yet I do not think it would be wise to supersede entirely the cultivation of trees of other species, long used and well approved. Let our enterprise and our industry have a fair chance in the grand experiment. R.

Hingham, January 20, 1834.

MASS. HORTICULTURAL SOCIETY.

THE following gentlemen were at the last meeting of the Horticultural Society, elected members thereof.

REPORT ON LIVE HEDGES.

"THE Massachusetts Society for the Promotion of Agriculture," in the view it was their duty to take of those objects to which public attention might be beneficially invited, have thought that in the progress of the culture and improvement of the country, Live Hedges would in many places become highly important and even necessary, where Stone is not to be had, and Timber as must soon be the case, shall become more valuable for other uses. The beauty, permanency and efficacy of this mode of enclosure is with foreigners and many of our own countrymen becoming a subject of taste and admiration. It is not our intention to deny the efficacy or expediency, in most places, at present, of a good Rail Fence, or what is better a strong stone wall. But as our divisions of land multiply, these materials, in many places, will become more scarce and difficult to be had. As this shall occur, the introduction of Live Hedges will come into use here, as they prevail elsewhere. A gradual introduction of them must be useful, and add a verdure and beauty to the face of the country, as its cultivation increases. Under this impression the Trustees of the Mass. Society were induced to offer a premium of \$30 for the best Hedge, not less than 100 rods, which shall be in the most thriving state in 1833.

On this subject the Committee on Live Hedges have a pleasure in presenting to the public the following communication of E. Hersy Derby, Esq. It will be seen that he has by well-tried experiments established the perfect adaptation of the Buckthorn (or Rhamnus Catharticus) to our climate, as well as its preference over several other plants.

They therefore unanimously award to E. Hersy Derby, Esq. the premium proposed of \$30 for his Hedge of upwards of 100 rods, and recommend that his detailed and useful communication on this subject be printed.

By order of the Committee,

JOHN WELLES, Chairman.

SALEM, Nov. 30th, 1833.

The Committee on Trees and Live Hedges:

GENTLEMEN: Please consider me an applicant for the premium offered by the Society for the best Buckthorn Hedge, not less than 100 rods, which shall be in the most thriving state in 1833. On

measuring mine, I find I have over 118 rods of the Buckthorn hedge, which I have reason to think would be considered at least equal to any in this country.

The Trustees generally have examined the state of it the present season. Should it be thought proper, I will make a few observations on my experiments in hedging.

I have been for a great many years fully convinced of the superiority of live hedges, for efficacy and economy. I began by setting out my first hedge about thirty years since, of the English Hawthorn; the result was far from satisfactory; the plant, being not adapted to our climate, is injured by our summer droughts; frequently experiences blight early in August, and by the first of September, assumes a wintry appearance. My next experiment was with the Three thorned Aca-cia; to this hedge I devoted the most careful attention; but the result was equally unsuccessful. The plants run up without interlacing, and the thorns growing only upon the upper branches, the stems below were not thick enough to serve as a fence; it was beside too tender a plant to bear our severe winters. I also tried the crab-apple with but little better success. About 1808 there was standing in the garden of the venerable Dr. Holyoke of this town, which adjoined that of my brother, a large tree of the Buckthorn or Rhamnus catharticus. In digging the latter, the gardener found several young plants which had grown from seed shed by this tree. They were given to me and set out in a nursery; finding they grew very rapidly, I was induced to set them out for a hedge some time in 1809, and in this attempt I was entirely successful. The length of this hedge is about 20 rods; has been a good fence over 20 years, and is at the present time in a fine healthy state, not a single plant having failed since it was first set out. It presents a mass of verdure from early spring until late in the autumn, and is completely impervious, affording entire protection to the land it encloses. It being my first experiment with the plant, I did not head it down so low when young, as I have since found it advisable to do; the consequence is that it is not so thick at bottom as any of my others set out since. Finding it so hardy a plant, and so well adapted for hedges in our climate, I have been induced to cultivate it very extensively, and have at different periods, extended my hedges until they measure nearly 120 rods in length.

The method I should recommend in setting a hedge, would be, to place the plants in a single row, about 9 inches apart, either in the spring or fall of the year; if in the fall, I should clip it the next spring, within six inches of the ground, which will cause it to be quite thick from the bottom; any after pruning can be made to suit the pleasure of the cultivator. I have also tried plashing; it was recommended to me in 1818 or 19, by my gardener, (an Englishman) and I allowed him to try it upon a young hedge of Crab-Apple; but the hedge never flourished afterwards, and I, at last, pruned away the branches he had interwoven, and lost four years' growth by the experiment. I have never found plashing necessary for the strength or beauty of the buckthorn hedge, the natural growth of the branches being sufficiently interlaced. Three years' careful management in the way I have described, is sufficient to form a perfect hedge, nearly as thick below as above.

I am, gentlemen, very respectfully,
Yours, &c., E. HERSY DERBY.

AN ADDRESS

BEFORE THE HAMPSHIRE, FRANKLIN AND
HAMPDEN AGRICULTURAL SOCIETY;*Delivered in Greenfield, Oct. 23, 1833. By HENRY COLMAN.*

PUBLISHED AT THE REQUEST OF THE SOCIETY.

"THE effort to extend the dominion of man over nature," says Bacon, the great master of Philosophy, "is the most healthy and most noble of all ambitions." This admirable sentiment is in nothing more true than in its application to agriculture. Here man exercises dominion over nature; exerts a power more nearly than any other resembling a creative power; commands the earth on which he treads to waken her mysterious energies; spreads fertility over barrenness; scatters the beauties and glories of the vegetable creation, where before all was desolate; compels the inanimate earth to teem with life; and to impart sustenance and power, health and happiness to the countless multitudes, who hang upon her breast and are dependant on her bounty.

Agriculture is the great interest of every community advanced beyond the savage state. I mean no invidious distinction. The interests of the social body are various; and in proportion to its improved condition its wants are multiplied to an indefinite extent. Many hands and many arts are necessary to erect, support, furnish, light up, adorn the grand superstructure of society, and supply the wants, and provide for the entertainment of its innumerable and insatiate guests. The division of labor is one of the most important improvements of civilization, and one of the surest evidences of its advancement. It is essential to the perfection of the arts of life. The humblest occupations are important; and if useful and honest, are respectable. He who labors with his mind, equally as he who labors with his hands, is a working man. The hardy ploughman who "joined drives his team a-field," and proudly strokes the smooth coats of his cattle, has no reason to envy the pale and emaciated scholar, poring till faint with exhaustion over the half formed progeny of his wearied brain; with eyes scarce open hunting for metaphors by the expiring rays of his midnight lamp; and waiting so long with hope deferred for the gushes of inspiration, that when at last the waters are troubled he has not strength enough to crawl to the fountain. In the crowded hive of human life, they who build the cell, as well as they "who gather the honey to store it well" are mutually useful and essential. But among the various occupations of society, agriculture obviously holds a commanding rank. If the prince may proudly say "I govern all," and the soldier "I fight for all," and the merchant "I pay all," the farmer may hold up his head as high as the rest, and with a noble self-complacency may say, "I feed all." What would become of the operatives, and of what use would be the curious and exquisite machinery of the largest establishment, if the power-wheel should cease its revolutions? Manufactures and commerce, all of science and all of art, all of intellectual as well as physical good, are dependant on agriculture. The agricultural products of one year, are not more than sufficient for the consumption of the animal creation until the succeeding harvest pours out its golden treasures. If the husbandman should remit his labors for a single season the human race must perish. What would philosophy do without bread? Without agriculture, the thundering wheels and the buzzing spindles of the manufacturer, must cease their gyrations. She too loads the buoyant

arks of commerce, and bids them speed their flight to the remotest regions of the earth, and return deeply freighted with the treasures of foreign climes.

Agriculture as a profession begins to occupy the rank among us, to which it has a just claim. Some of the most distinguished men in our own and other countries, in the present and past ages, men as eminent for intellectual and moral attainments as for the station which they have occupied in public regard, and the part which they have performed in public affairs, have honored the profession and themselves, by engaging even in its humblest labors and details; and have ingenuously confessed, that they have found in its calm pursuits an inexhaustible source of interest and recreation, and a more grateful pleasure than the brilliant scenes of public life have afforded. The elements of true dignity of character are integrity, usefulness, activity, and intelligence. This beautiful valley, watered by the beneficent stream, whose name it bears, and fenced in by those magnificent highlands, which mark its progress to the ocean, presents in its farming population so many examples of this noble combination, that the profession of agriculture here occupies a front rank among the most useful and respectable.

It is with unfeigned diffidence that I address an assembly of such men on this occasion. Feeling myself, even after years of inquiry and practice in this great art, only a learner, and a comparative stranger in this part of the country, I was honestly averse to this duty. I shall attempt nothing more than to offer such hints, as may stimulate the inquiries of others; and should it appear that I am greatly out of my place, I shall console myself with the reflection, that the responsibility of the appointment rests not with him who accepts, but with those who make it.

The agriculture of the counties under the auspices of this Society is highly respectable; but I trust I shall not give offence, by saying that it admits of great improvements; and by referring to some points to which our efforts for improvement may be directed.

The agricultural population here may be divided into three classes. First those, who, besides cultivating some land, are likewise tradesmen or mechanics; and with their agricultural unite some mechanical or professional pursuit, to which their farming is only secondary. The returns of husbandry are in general so much slower and smaller than those from their art or trade, that the latter is likely to absorb much of their attention to the prejudice of their husbandry. There are eminent exceptions to this remark; and we owe to some of these persons many valuable experiments in agriculture, which their ready capital has furnished them with the means of making under circumstances of great advantage.

The second class is composed of those who, occupying small farms, look for nothing from their farms beyond the bare support of their families; having other resources, they feel independent of its returns; or devoid of ambition, and indolent and improvident, they are content with the most scanty returns. Ignorant of the art of living, they are in general in the midst of the means of abundance destitute of common comforts; and are satisfied if they obtain, by a little labor inconstantly and indifferently applied, the bare necessities of life.

The third class comprehends those with whom agriculture is an exclusive profession; who are willing to labor, and are seeking the fair rewards of industry. Stimulated by an honest desire of profit, they are anxious to extend their cultivation to the farthest point to which it may be carried to advantage. It is to this latter class, who alone, properly speaking, deserve the name of farmers, that my remarks will be directed.

Farming here consists of three kinds; first, dairy farming; second, grazing, embracing sheep husbandry, and the raising of young stock; and lastly arable farming, including the consumption of the produce on the place, by the stall-feeding of cattle, sheep, or swine. There are many farms, which to a certain extent combine these pursuits; but these objects are distinct, and cannot often to any great extent, be advantageously prosecuted together.

I. Of dairy husbandry, I shall say little. The art of making cheese is well understood among us; and its quality in general good; but in regard to butter, great improvement is as desirable as it is practicable. Much of that manufactured here, is scarcely tolerable. Any person, accustomed to eat the butter brought into the Philadelphia market, must have observed its extraordinary superiority in flavor and richness, to the article generally produced among us. What occasions this superiority? There is an advantage in the spring houses of the Pennsylvanians, built of stone over some running water, where the milk is always kept, and which is devoted exclusively to dairy purposes. This and the cultivation of white clover in their pastures, the frequent churning, so that the cream is never old, the entire expression of the butter-milk, and the most particular attention to cleanliness in every part of the process, are the probable means of their success. But in these respects, there is not a single circumstance in which we might not equal them; and since the difference in the prices of butter between that of an exquisite quality, and that of an ordinary kind is more than a hundred per cent. our dairy farmers have sufficient inducements to endeavor to excel. The premiums bestowed for this purpose under the direction of the Massachusetts Agricultural Society, have had a highly beneficial effect; and have proved that we are capable of producing as good butter as can be made. Some exhibited on the present occasion fully establishes this assertion. I may remark in this connexion, that little attention is paid to our pastures. Plaster and ashes are seldom applied to them, though in most cases without a doubt, the application would be highly beneficial; and they are suffered, without concern, to be overrun with brakes, briars, and that increasing pest, the Canada thistle. There is reason to believe, too, that our dairy farmers pay little attention to ascertain the comparative quality of the milk of their different cows, which in respect to its yield of cream, and of course the amount of butter which may be made from it, must differ very greatly; some yielding milk of the richest quality; and the milk of others being worthless.*

* In a former publication, I have stated a fact coming under my own observation, that in an experiment of milk, taken at the same time and placed in the same situation, and where the cows were fed in the same manner, the milk of one cow yielded at the rate of one inch and three tenths of an inch of cream upon nine inches of milk, and that of another cow in the same yard, produced only two tenths. In the quality of the milk of the two cows for the purpose of making butter, the difference then was 13 to 2.

11. In respect to sheep husbandry, and the raising of young stock, many farms from their rough and mountainous character, are adapted solely to these objects. The raising of neat stock, however, beyond the consumption of coarse fodder upon a farm, is not a source of great profit, unless upon land of low price. The stall-feeding of beef animals upon hay and meal, is likewise a very doubtful source of gain, at the average price of hay and grain among us. Few farmers have exactness enough of calculation or experiment to determine whether it does or does not yield a fair compensation for their labor and produce; and the purchasing of cattle for the purpose of stall-feeding, is so much matter of judgment, skill in trade, or mere accident, the thrift of different animals is so different, the state of the market is so precarious, and by the present mode of management, the farmer is liable to so many impositions and frauds, on the part of dishonest dealers and butchers, that the chance of success is by many judicious farmers considered very small. It were greatly to be wished, that some mode or standard could be adopted of selling the animal by live weight on the hoof, to avoid the evils and inconveniences of the present mode, by which the seller is placed entirely at the mercy of the buyer, with no security against fraud, and with scarcely the possibility of redress.

It is confidently believed, that the sheep husbandry when judiciously pursued, affords far better prospect of gain. It is ascertained that no husbandry will do more to preserve and improve the condition of a farm; and those farmers, who have steadily persevered in it, even under all the fluctuations through which the prices of wool have passed, have received a full remuneration for their care and expenditure. The great question of comparative advantage between the fine wooled, the medium quality, the long wooled, or our common native sheep, presents a subject involving such various considerations, that the present time does not admit of its discussion. The introduction of fine wooled sheep into the country, has been of very great advantage; and though to the serious loss of those persons, who, as mere speculators, deluded by most extravagant calculations of profit, paid enormous prices for their flocks; yet to the ultimate and great benefit of those more prudent or more fortunate individuals, who came after them, and reaped the advantage of a reaction in the public estimation, of the value of these races of fine wooled sheep, which the heavy disappointment of the first purchasers occasioned. Extreme fineness of fleece is obtained only at the expense of a small and tender carcass. It is confidently hoped that by a judicious combination of the merino with sheep of a larger size, a race may be gradually formed, yielding wool of a sufficient degree of fineness for the common demand, combined with a carcass large enough for the market. Such attempts have already been made with every prospect of success.

(To be continued.)

MISCELLANY.

WOMAN.

The celebrated Fontenelle said that women have a fibre more in the heart, and a cell less in the brain, than men.

As the dew lies longest and produces most fertility in the shade, so woman in the shade of domestic retirement sheds around her path richer and more permanent blessings than man, who is more

exposed to the glare and observation of public life. Thus the humble and retired often yield more valuable benefits to society, than the noisy and bustling satellites of earth, whose very light of unconcealed enjoyment deteriorates and parches up the the moral soil it flows over.—*N. Y. Star.*

THE AFFECTION OF A WOLF.

By way of enlivening the description of the structure of animals, M. de Candolle (lecturer on natural history at Geneva,) introduced many interesting particulars respecting what he called *leur morale*, or their natural dispositions, and the changes they underwent while under the dominion of man. Among other instances of affection which wolves had sometimes shown to their masters, he mentioned one which took place in the vicinity of Geneva. A lady, Madame M—, had a tame wolf, which seemed to have as much attachment to his mistress as a spaniel. She had occasion to leave her home for some weeks; the wolf evinced the greatest distress after her departure, and at first refused to take food. During the whole time she was absent he remained much dejected; on her return, as soon as the animal heard her footsteps, he bounded into the room in an ecstasy of delight, springing up, he placed one paw on each of her shoulders, but the next moment fell back and instantly expired.

THE FORTY-SECOND REGIMENT.

The following characteristic anecdote of this gallant regiment may be depended upon as true, having been lately communicated to the writer by a General Officer in the army, who was at the time the occurrence took place, a Field Officer in that regiment.

Immediately before the 42d disembarked in Egypt in 1801, under the command of the brave Abercromby, orders were given not to fix their bayonets, nor to load their muskets till they were all on shore, although the enemy's shot was falling in and round the boats like hail. After the regiment had formed into line on the beach, which was done in the most cool manner, under the destructive fire from a French battery and a battalion of infantry on the heights in front, Major Stirling gave the word, "fix bayonets." In a moment every man's bayonet was fast to his musket. The Major next followed with "prime and load," but the words had scarcely escaped his lips, when an individual in the ranks vociferated;—"No prime and load—but charge bayonets—and by God immediately!" The entire regiment, as one man, instantly obeyed this energetic command, ascended the heights at the charge, and carried the French position with cold steel in the most gallant style. But the question immediately arose, who was the individual that ordered the charge, when the Commanding Officer had only given the word to prime and load. On inquiry, it was found that the person who had assumed the command, was no other than "Donald Black," a private soldier, and an old smuggler from the Island of Skye. An individual in the same regiment stated to the writer, that on General Moore arriving on the spot, he told the 42d their bravery was beyond all praise, but that not obeying their commanding officer was a great breach of discipline, and on the present occasion the movement might have had a fatal termination: and at the same time turning round to the Colonel, he admonished him for the irregularity of his men.

Col. Dickson replied, "I might have held one man; but by God, General, it was impossible for me

to hold a whole regiment." But, Donald Black's (in gaelic Dhu) Highland blood was in a flame, and being quite indignant at what he thought unnecessary loss of time, his impatience to close upon the foe, in the Scottish manner, made him lose sight entirely of the humble station which he occupied in the corps. As Shakespeare says, "all is well that ends well," but had this furious charge failed, it would have been a black day to poor Donald. A court martial, and the halberts would likely have been the reward of his native ardor and impetuosity.

This hot and fiery temper of the Scots, caused them to lose many battles in their ancient wars with England. A few showers of arrows from the long bows of the English archers, were sufficient to exhaust the patience of the Scottish armies when they would, without discipline, order, or command, rush headlong upon the cool and steady foe, strictly obedient to the orders of their commanders.

EMPLOYMENT INDISPENSABLE TO COMFORT.

In a very interesting article on the philosophical history of hypochondriasis and hysteria, in the 23d number of the *Foreign Quarterly Review* for July, 1833, is the following passage, (p. 117).

"It is some disappointment to a humane person to find, that of all men who are discontented with their lot, none exceed in the quantity of their grumbling, and in the habit of looking on the wrong side of things, and in a proclivity [propensity] to hypochondriacal imaginations, the old pensioners of the army and navy at Chelsea and Greenwich. Placed above the fear of want, but deprived of all motive to exertion; neither moved by hope nor by fear, for they have neither promotion to look to, nor disgrace to apprehend; they are miserable, precisely because they have nothing to do. We have often thought that some gentle duties, analogous to the former habits of the lives of these deserving old men, would be a great blessing to them."

On this subject Loudon, the conductor of the *Gardener's Magazine*, makes the following suggestion:

"Now, we would suggest that to every hospital there should be attached a garden, sufficiently extensive to occupy in its culture all the inmates. Though this sort of occupation might not be 'analogous to the former habits' of these inmates; yet we are persuaded that it is so natural, that they would soon not only become accustomed to it but fond of it. Why should not the whole of the vacant ground at Chelsea Hospital be turned into a garden, and put under the care of a good gardener, who would direct the labors of such of the pensioners as were able to work in it?"

WINTER BUTTER.

We acknowledge with pleasure the receipt of two fine specimens of butter, made and presented by Mrs. M. W. Howard of the Vaughan farm. It is beautiful in appearance and excellent in taste, and proves that even during the rigorous winters of Maine, butter that would suit the most fastidious palate may be made, if proper skill and care be brought to the business. Mrs. H. says, "That there is nothing peculiar in the process. Before setting the milk, I pour a sufficient quantity of boiling water into it, to make it nearly as hot as it can be borne by the finger. Keep the cream from freezing, and when it is ready to churn, add the juice of a middling sized carrot to four quarts of cream."—*Winkrop Farmer.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JAN. 29, 1834.

AGRICULTURAL INFORMATION.

THERE are but three sources from which mankind obtain that knowledge which is power,—those mental acquisitions, which alone give civilized man a superiority over the savage biped of the wilderness. These sources, or fountain heads of intelligence are Observation, Conversation and Reading. Deprived of these the mind of a Solomon or a Newton would be as complete a blank as that of an idiot. Of these means for furnishing minds with useful ideas, probably observation and conversation are the most important, though still incomplete without reading.

But in order to give observation its full effect, its sphere should be as extensive as a man's leisure and circumstances will permit. A cultivator whose acquaintance with men and things is confined to his own homestead, with now and then a glance and a common-place inquiry or observation directed to the farms and their occupants in his immediate vicinity, may possess a strong intellect, but can hardly fail to be narrow minded. He cannot avail himself of the many opportunities which always occur in the journey of life to make the path plain and pleasant to those who "order their steps aright."

An English writer, in adverting to the importance to farmers of extended observation remarks as follows:

"Were I to name one circumstance, which has within the last twenty years advanced the husbandry of this country more than any other, I should fix on the practice of farmers *taking their nags* (to use an expression of Bakewell,) *to see what other people are doing*. Men who are confined their whole lives to one particular spot, necessarily contract a too limited range of thought. Their ideas flow so much in the same channel, and dwell so much on the same objects that new ones, however useful, make too faint an impression: nor can they know what is doing by the best farmers, on soils, perhaps exactly similar to their own. To take a ride, for a fortnight, through four or five hundred miles of country, with an eye scrutinizing every thing they see, and calling upon noted farmers to make inquiries about such objects as appear interesting, must necessarily give a new movement to their minds, a new spring to thought, and remove many prejudices. If only one journey be taken in a year, and that at a vacant time, perhaps June would be the best season: but, as I propose that two should be taken, one may as well be in January as any other month. This season will explain the winter management of live stock, the important objects of the farm yard, fattening beasts, sheep-feeding in many branches, winter irrigation, and many other objects truly interesting."

A METHOD OF REARING EARLY PEAS AND OTHER VEGETABLES.

An English Gardener states that "the method of rearing peas in pots and boxes, in hot beds and hot-houses, and afterwards transplanting them out into the open ground, is a common practice with gardeners, and often succeeds very well; particularly if they are not too long in transplanting them; but I would recommend a method not so well known, as far preferable to that of pots and boxes; particularly when they are to be raised in a hot bed. This consists in having a quantity of

turf cut into pieces, of about nine or ten inches long, and three or four broad, which are placed in a regular manner over the surface of the hot-bed, grass side downwards, and a row of peas is sown upon each row of turf, and afterwards covered with soil; when they are fit for transplanting, no more is required than to lift out the turf, piece by piece, with the peas growing upon it, and place them where they are to produce their crop. By this means the roots receive no injury, nor do the plants sustain the least check in transplanting. This method may be practised with similar success in the raising of potatoes, beans, &c."

SEA WEED FOR MANURE.

A FRIEND has expressed a wish for our opinion of the use of sea weed as a manure, the best mode of preparing and applying it, &c. Not having had much personal acquaintance with this substance, or its agricultural uses, we can only give the opinion of a competent judge on whose authority in subjects of this kind we are accustomed to place implicit reliance. The following is from *Sir Humphrey Davy's Agricultural Chemistry*:

"Sea weeds, consisting of different species of fuci alago and conservæ, are much used as manure on the sea coasts of Great Britain and Ireland. By digesting the common fucus, which is the sea weed usually most abundant on the coast, in boiling water, I obtained from it one eighth of a glutinous substance, which had characters similar to mucilage. A quantity distilled gave nearly four fifths of its weight in water, but no ammonia; the water had an empyreumatic and slightly sour taste; the ashes contained sea salt, carbonate of soda, and carbonaceous matter. The gaseous matter was small in quantity principally carbonic acid and gaseous oxide of carbon, with a little hydro-carbonate. This manure is transient in its effects, and does not last for more than a single crop which is easily accounted for from the large quantity of water, or the elements of water which it contains. It decays without producing heat, when exposed to the atmosphere, and seems as it were to melt down and dissolve away. I have seen a large heap entirely destroyed in less than two years nothing remaining but a little black fibrous matter."

"I suffered some of the finest part of a fucus to remain in a close jar, containing atmospheric air, for a fortnight. In this time it had become very much shrivelled; the sides of the jar were lined with dew. The air examined was found to have lost oxygene, and contained carbonic acid gas."

"Sea weed is sometimes suffered to ferment before it is used; but this process seems wholly unnecessary, for there is no fibrous matter rendered soluble in the process, and a part of the manure is lost."

"The best farmers in the west of England use it as fresh as it can be procured, and the practical results of this mode of applying it, are exactly conformable to the theory of its operation. The carbonic acid formed by incipient fermentation, must be partly dissolved in the water set free in the same process; and thus become capable of absorption by the roots of plants."

"The effects of sea weed as manure, must principally depend upon this carbonic acid, and upon the soluble mucilage the weed contains; and I found that some fucus which had fermented, so as to have lost about half its weight, afforded less than one twelfth of mucilaginous matter; from

which it may be fairly concluded that some of this substance is destroyed by fermentation."

From the *Genesee Farmer*.

DRAINING, TURNIPS, CHESS.

MEASRS. TUCKER & Co.—Being past the meridian of life when I first set foot in the United States a few years ago, and having taken the oath of allegiance to the government, under which I intend to spend the remainder of my days, I may be allowed to entertain sincere good wishes for its prosperity, and hope to be excused for using the privilege of offering a few general remarks in regard to agriculture, a pursuit in which I was practically engaged in Scotland for thirty years.

It is gratifying to observe from several communications in the Farmer, that public attention is awakened in regard to the importance of two branches of husbandry, which have been practised with great success in Britain for at least half a century, namely, draining and the culture of turnips. Without drains a farm in Britain is considered to be much in a state of nature, and the introduction of turnips into that island about 60 years ago, was justly considered and is designated by its most eminent authors, as one of the most remarkable eras in the history of British agriculture. Assuredly there can be no good reason for neglecting, in this State at least, those two branches of rural economy, which perhaps more than any other have been the means of improving the circumstances of farmers in the Old Country. In regard to Turnips, however, from my own experience both in this State and in Scotland, it is much to be feared, that very many farmers will be deterred from prosecuting that branch of farming from the liability to failure in their first essays. This was the case in Scotland, particularly at the period of its introduction. Having grown annually in that country about 50 acres for 25 years successively, there appeared no obstacle to being successful in this State. But last year (1832) it did happen that my crop failed. Having attributed that failure to my ignorance of climate and other circumstances, I sowed this year about one acre of ruta baga, and one acre of mangel wurtzel, and had as good a crop as I had generally in Scotland for the long period of years above-mentioned—say three bushels a rod; which I am at present feeding out to cows, steers, hogs, poultry, and horses. The whole roots are steamed, which, in the severe winters in this State, appears to be an indispensable process.

In regard to draining, I take the liberty of remarking, that it appeared to me a very singular circumstance in this State, (and I have been in no other) that very few open drains or ditches were made, and that the practice of ploughing into lands or ridges was rarely to be seen,—circumstances which satisfactorily account to an old country farmer for the frequent complaint of wheat being *winter killed*. However, as to open drains, my short experience has convinced me of the inexpediency of these, owing to the injurious effects of frost; but I cannot imagine any cause for the omission of ploughing into lands and drawing cross or water furrows in all hollows and at the head lands. Even in Britain, where the winter is comparatively mild, open draining is now very generally superseded by the under or covered mode of draining; and it is a very common thing in many arable districts in that country, (where there are professional drainers) to drain farms of two

hundred acres at an expense of \$100 per acre, and that by tenants or leaseholders (not owners of the land) who may have hired a farm for only fifteen or twenty years. But you are aware that immense benefit is derived from covered drains, though less frequent, if judiciously laid out at a very great deal less expense than \$100 per acre. These facts are the best commentary on the great utility of draining.

One word on the long and frequently discussed subject of Chess, and I shall have done. For 35 years, and that is within my recollection, chess has been called in Scotland Goose Grass—the botanical name I know not; but from examination I am certain that these words apply to the same grass, which was never supposed to be spurious or degenerated wheat. Having sowed annually a hundred acres of that grain on a hired farm, I am rather disposed to speak with some confidence on the subject. It can scarcely be imagined that British farmers are more indifferent to goose grass than to cockle, blight, mildew, or rust. Instead of that being the case, no farmer would buy seed wheat if mixed with chess. Genuine and clean seed of all kinds, is there a subject of general solicitude. I may mention, by the bye, that chess is a word not found in the English dictionary.

I am, sir, your most obed't serv't, T. D.
New Hartford, Oneida Co. Dec. 30, 1833.

From the Concord Yeoman's Gazette.

MASSACHUSETTS HORTICULTURAL SOCIETY.

This Society has been in existence five years,—and has increased its members and extended its usefulness during that short period, to a degree exceeding the anticipations of its most zealous friends. The object of this Association is, as we understand it, to improve the general character of Fruits, Flowers, Garden Products, &c. through the combined influence of learning, wealth and industry. To carry this praise-worthy object into operation, the society—(embracing men of all professions, from the Chief Magistrate of the Union to the untitled cultivator of the soil)—has at a great expense, transformed the wild and romantic scenery of "sweet Auburn," into a beautiful "experimental Garden," and a resting place for the dead, in imitation of the celebrated cemetery Pere La Chaise, located in the vicinity of the city of Paris.

The society numbers nearly 600 members, so we learn from its catalogue; also 86 honorary members, and 67 corresponding members,—embracing most of the distinguished men in the country, and many eminent foreigners. For the advancement of the objects of the society,—Standing Committees are appointed on Fruit Trees, Fruits, &c.; on the Culture and Products of the Kitchen Garden; on Ornamental Trees, Shrubs, Flowers and Green Houses; on the Garden and Cemetery; Library; and on the Synonyms of Fruits.

A public Exhibition of Fruits, Flowers, &c. takes place weekly at the Society's rooms in Boston. The terms of admission to membership we know nothing about; we notice in the list of members, the names of all our principal Agriculturists living in the vicinity of the city—but a few, however, beyond the town of Lexington—and not one in Concord.

The anniversary of this Society was celebrated in Boston, in September last; on which occasion, an Address was delivered by ALEXANDER H. EVERT (brother to Edward Everett) a part of which we this day present to our readers. This Address

is truly interesting, and will richly repay a perusal; it is from the pen of one who ranks high in the literary community, as the talented and accomplished Editor of the North American Review, and as the author of "Europe"—a work which has insured him imperishable fame.

Mr. EVERETT, for several years, resided near the Court of Spain as minister from the United States—and has travelled extensively on the Continent of Europe. He is now one of the most able, impartial and upright members of the Senate of this Commonwealth—representing the County of Suffolk.

ITEMS OF INTELLIGENCE.

In Potter county, Pennsylvania, three rivers have their source very near each other; and their confluent mouths at a singular distance. The rivers are the Susquehanna, the Alleghany and the Genesee—which flow respectively, into the Chesapeake Bay, the Gulf of St. Lawrence, and the gulf of Mexico.—*N. Y. Standard.*

Robert Whitefield, farmer, and a respectable and exemplary man, of Upper Lachine, near Montreal, was burnt to death, in an attempt to rescue his cattle, and other property from his barn, which had taken fire from the sparks from his dwelling house.

The Philadelphia U. S. Gazette says, a fireman's dress, the new article saturated with India Rubber, stood a three hours' drenching at a late fire, without the lining being wet.

A valuable dog, belonging to a gentleman of Gettysburg, Pa. a few days since, fell into a well, which was about 15 feet deep to the water. A rope was thrown to him, which he immediately seized with his mouth, and held on, until he was hoisted to the top in safety.

Phil. Daily Adv.

MASS. HORTICULTURAL SOCIETY.

AN adjourned meeting of this Society will be held at their new hall, 81 Market Street, on Saturday next at 11 o'clock.
J 29 ROBERT TREAT PAINE, Rec'g. Sec'y.

NOTICE.

A young man, 25 years of age, bred a farmer, and is capable of overseeing and laboring on a Farm, wishes for employment in the above business. Letters post paid, and addressed to Moses Field, Northfield, Mass., will be attended to. Testimonials of good moral character and ability, can be given if necessary.
3t Jan. 29.

THE GREAT BULL HERCULES

—Will be sold at auction on Saturday, Feb. 8, at 12 o'clock, M., unless previously sold at private sale.—Weight 3375 lbs. For size, form and figure, this animal excels any ever produced in America. He was raised in Greenland, N. H. is of the full blood short horned Durham breed, celebrated throughout Europe and America, is six years old and in perfect health.

The above named animal may be seen together with a Bull and Cow of the East Indian breed named Zebus, the smallest of the cattle kind, the pair weighing only 350 lbs. and the first ever exhibited in this city. Also, two living alligators, with a variety of other animals.—At the exhibition room in Flagg Alley, opposite the south west corner of Fauell Hall, until the day of sale. Admittance, 12½ cts. Jan. 29.

TO BE LET

THE whole, or part of a Farm, in the vicinity of Boston, containing about 95 acres of good land, with a convenient House, Barn, and out houses—of which possession may be had on the 1st of April next.—Provided application is made by a capable, steady and industrious man, of good moral character, and who has been educated in the business of Farming, and who will produce a good recommendation of such qualifications—and none other need apply.

For further information, enquire of the proprietor and publisher of the New-England Farmer, at his Office, Nos. 51 & 52, North Market Street, Boston.

CASH STORE.

THE subscriber offers for sale a large stock of English and American Goods at reduced prices, among which are:
Bales Black Bombazette of good quality, at 12½ cts. per yard.
" Green " " " "
" Blue and Brown Camblets of good quality, at 12½ cents.
" Scotch Plaids, " " "
" English, Sup. & fine 6-4 Merino from 3s. to 8s. per yard.
" French " " " " \$1 to \$2 " "
E. S. BREWER, 414 Washington Street.

BRIGHTON MARKET.—MONDAY, JAN. 27, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 408 Beef Cattle, and 852 Sheep, divided as follows:—At Brighton 177 Beef Cattle, and 182 Sheep; at Cambridge 231 Beef Cattle, and 670 Sheep—including 17 Beef Cattle and 340 Sheep unsold last week.

PRICES. *Beef Cattle*.—An advance was effected on former prices. We noticed 15 or 20 very fine taken at \$6.—We quote prime at 4 50 a 4 75; good at 5 a 5 25; thin at 4 a 4 50.

Sheep.—One drove of 300 were very fine, and were sold for a high price. We noticed several inferior lots taken at 2 50, 2 75, 3 and 3 25.

SITUATION WANTED BY A GARDENER.

A young man, who is perfectly conversant with each department of his business, and can produce satisfactory recommendations. Any commands addressed to A. B. and left at the office of this paper will be promptly attended to.

Jan. 29.

GEO. C. BARRETT,

HAVING MADE ENLARGEMENT IN HIS

SEED ESTABLISHMENT,

the present season, respectfully presents the following CATALOGUE to his subscribers, customers, and others, and would request their orders as early as possible, as the execution of them, is personally attended to by the proprietor. Dealers are particularly requested to forward their orders immediately.

USEFULNESS OF THE STRAW CUTTER.

The following letter gives conclusive testimony, in addition to many proofs we have heretofore published, of the value of the important implement here named.

Beverly, Jan. 25, 1834.

MR. J. R. NEWELL—Dear Sir, It is with pleasure that I comply with your request, asking the result of my experience on the subject of feeding stock. My stock consist of 51 head, viz. 8 horses, 6 oxen, 35 cows and 2 yearlings. This stock was fed in the usual way with English, salt and fresh meadow hay, with meal and potatoes as their condition required, to the 1st of December last, at which time I commenced chopping my hay. In giving the result of my experiment I must in some measure ask the privilege of a yankee, viz. that of guessing; but in this case I think I can guess pretty correctly, as much of the hay has been loaded in consequence of having to remove it from one barn to the other, and calculating the number of days a load would last, the result is as follows:

| | |
|--|--------|
| 700 lbs. English hay, at \$16 per ton, | \$6,60 |
| 200 " fresh " " 4 " | 40 |
| 100 " salt " " 8 " | 40 |
| 3 bushels corn meal, | 2,25 |
| 8 " long red potatoes, | 1,60 |

| | |
|---|---------|
| Per day, | \$10,25 |
| 400 lbs. English hay chopp'd, \$16 per ton, | 3,20 |
| 100 " fresh " " 4 " | 20 |
| 100 " salt " " 8 " | 40 |
| 3 bushels corn meal, | 2,25 |
| 4 " long red potatoes chopp'd, | 80 |
| 140 gallons pure water, | 0,00 |
| 1 man at \$3 per month, | 31 |
| Board of man at \$1,50 per week, | 23 |

Per day, \$7,39
Balance in favor of Straw Cutter, \$2,86 per day.

In addition to the above balance, may be added an increase of six gallons of milk from twenty five cows then in milk, and likewise something for the improvement of the condition of my whole stock.

Yours respectfully, AMOS SHELLEN.

From the Genesee Farmer.

DISEASED HORSES.

MESSRS. TUCKER & Co.—I have read the remarks of *Onondaga*, in the Farmer of Dec. 21, respecting the Black Tongue, and the doctoring of horses generally. I am pleased with some of his observations, but I think he is mistaken in some things. In speaking of the pulse of the horse, he says that 50 to a minute and upwards, indicates a high fever. So say I, if enough upwards of fifty. The pulse of a horse in good health, with low feeding, beats from 36 to 40 per minute; if high fed, his pulse may go 45, and some more, without any more fever than is occasioned by the high feed. In simple and symptomatic fevers, the pulse will run from 60 to 72, and in cases of inflammation of the lungs or pleura, in the early stage of the dis-

ease, the pulse is often from 62 to 80, when nothing but excessive bleeding with continued clysters, will be of any service.

The best place to ascertain the pulsation of a horse, is under the jaw-bone, where the artery passes on to the side of the face. In this situation the artery is covered by the skin only, and as it rests against the bone, its strength or weakness may be ascertained with the nicest exactness and accuracy. When a horse is in health, the artery feels neither hard nor soft, but perfectly elastic; but, when in a fever, the artery becomes often so hard, as to resist the pressure of the finger, and will beat, as said before, from 60 to 80 a minute.

As there is nothing like comparing notes to come to the truth, I wish you to give the above a place in your Farmer.

A SCOTCHMAN.

AN ADDRESS

BEFORE THE HAMPSHIRE, FRANKLIN AND HAMPDEN AGRICULTURAL SOCIETY;
Delivered in Greenfield, Oct. 23, 1833. By HENRY COLMAN
PUBLISHED AT THE REQUEST OF THE SOCIETY.

(Continued from p. 329.)

III. I PASS hastily along to the subject of arable farms. Indeed I can do no more than suggest a few imperfect hints for your consideration, as I fear I may trespass upon the kindness of a portion of my audience, who feel little interest in the humble details of agriculture. Few will deny that the details are proper to this occasion. I need not hespeak the candor of farmers' wives and farmers' daughters, if indeed the old race of milk maids and working girls be not wholly extinct; and I may whisper even to the gentlest, the sweetest humming birds and the most gorgeous butterflies of the fair sex, that they may gather honey from the wildest flowers of the most neglected field. I may crave too that they would not disdain the husbandman's humble toil, since they are not too ethereal to be beyond the need of its fruits; I may say more, that love is so wayward, perchance some sturdy ploughman may yet be eligible to the highest honors, which they have to bestow; but let them not be unduly alarmed at an accident of this kind; under his tanned skin, his rough hand and his coarse exterior, there is often found as true a heart and as devoted a duty, as in the most polished beau that ever emerged from a city band-box.

The territory, embraced under the auspices of this society, comprehends a great variety of soil; and much of the best arable and meadow land in New England. Nor is there any extraordinary discouragement here to cultivation; labor is not more expensive than in other parts of the country, though it is too high compared with the value of the produce; vast quantities of bread stuff are imported into the country; and whatever grain is raised will for the present command a higher price in cash than the same articles on the sea-board.

There are, however, some serious obstacles to success. One of the principal is the worn-out character of our lands. They have been so long under cultivation as to become exhausted, and yield small returns to the cultivator. Our crops of Indian corn do not average more than thirty bushels to the acre; of rye not more than twelve; of potatoes not more than two hundred; and of hay, excepting on alluvial lands annually inundated by the river, not more than one and a half ton. These crops are by no means what they might be. Now whether it is owing to too severe a cropping by the repetition of the same crop on the same land without intermission; or to too scanty manuring; or to an injudicious cultivation, I shall not presume to decide. In some cases, these several causes are combined.

Liberal manuring is the basis of all successful agriculture; and it is folly, under any circumstances, excepting the virgin lands of the West, where there has been for centuries, an accumulation of untouched vegetable matter, to disregard the great law of nature, which requires that the soil should be often replenished, in order to obtain its products, as much as that the cow, which is daily milk-

ed, should be daily fed. Next to liberal manuring a judicious rotation of crops should be followed up; for nature chooses a variety, and scarcely a crop of any kind, can be cultivated successively, and without intermission on the same land, without a gradual diminution of the produce. The best advantages may be expected likewise from that great discovery in agriculture, the renovating influence of clover, which, being sowed with small grain and well plastered, and being afterwards turned under by the plough, will inevitably place the land in a course of improvement. It is questionable with some farmers, whether it is best to plough in the clover, the year after its being sown with the stubble of the grain crop; but there is good reason to believe, that it is better to suffer the clover to remain one year, and to adopt what is commonly called the three shift system; for example, first corn; then small grain with clover, which is to be well plastered; and then clover to be mowed or fed; and this, where the clover can be advantageously pastured with sheep, will secure the gradual improvement of the land.—There are other ameliorating crops; and the ploughing in of green crops, in several decisive experiments, has been signally successful; but no system can be worse than that sometimes practised, and of which examples may be seen in the beautiful meadows of Hatfield, which operate more effectually to set off by way of contrast, other parts of their fine farming; I mean the practice of naked fallows, with the hopes that exhausted lands may be recruited by mere rest and weeds.

The next obstacle to improvement, is the want of manure. This is a serious want. Good crops cannot be obtained without manure, but how to obtain the manure is the difficult question. The first step certainly is the consumption of the produce upon the place. This is pretty generally done; but much of the materials for manure furnished by the crops themselves, is most improvidently wasted. This is particularly remarkable in regard to the corn crop, where the butts and husks instead of being carried into the barn and yards to be there used as food, or converted into manure as litter, are left to perish in the field, returning comparatively nothing to the earth; and though browsed by cattle, yet yielding under these circumstances nothing deserving consideration. You will pardon me, if I speak of such a practice as wasteful and slovenly. Every vegetable product on a farm, which can be used advantageously as food, should be so appropriated; and what will not answer as food, should be carefully collected for the purpose of littering the styes, stables and yards. The great rule should be, to gather up the fragments that nothing be lost.

In the next place almost every farm furnishes in some bog-hole or reservoir valuable materials for compost manure, which if carefully conveyed to the styes and yards, to be worked over, and made to absorb the liquids which are there floating, will turn to great advantage. The conveyance of common dirt, other than sufficient for this absorbing purpose, will not pay the labor of transportation; for the manure may as well be mixed with it in the field as in the barn yard, and the labor of carting be saved. In some parts of the country, as for example, in Bernardstown, where the soil is cold and hungry, there are extensive depositories of peat mud, which, where properly managed, and made to undergo a fermentation by the intermixture of horse manure, a process well known to intelligent

farmers, and by the discovery of which the name of an English nobleman has been immortalised, will yield a valuable manure, precisely suited to the soils among which it is found.

The agriculture of our country is not yet in a sufficiently advanced state to pay much attention to the saving of liquid manures; as in the best cultivated countries of Europe, where it is considered as the most useful form of applying all animal manures; and where every farm is furnished with the means of preserving and of applying this most powerful stimulus to vegetation. Provision for the same purposes will presently be made among us, when our farmers feel more sensibly, than they now do, the importance of availing themselves of every source of productiveness and profit within their reach.

The soiling of animals, that is keeping them in yards or stables through the whole year, where, when attainable, they are fed upon green food daily gathered for their use, is an abundant source of manure; and to a certain extent, as in many of our river towns where pasturage is difficult to be procured, might be practised to the great advantage both of the stock and the owner. Few persons, who have made no experiments and given no attention to the subject, have any proper idea, to what advantage and extent, the produce of a single acre properly cultivated may be applied. I shall make no apology for speaking with so much directness on so homely a subject as that, which we have now treated. It is nothing but a silly affectation of delicacy, which turns with disdain from any of the wonderful processes of nature however humble. The most splendid bouquet, which ever poured out its delicious perfumes on the unsullied bosom of youthful innocence and beauty, is the luxuriant offspring of the manure heap; and the cultivated, well-disciplined, and devout mind, will contemplate with grateful delight that mysterious operation of divine Providence, that signal display of an unsearchable wisdom and goodness, by which every thing in nature becomes subservient to some valuable end; and the most offensive substances are converted into objects and forms of beauty, utility, luxury, and delicious indulgence.

The use of mineral manures, such as lime and gypsum, ought to claim much more attention than it has done. The theory of their operation is still among the numberless secrets of nature, into which human sagacity attempts in vain to penetrate, and before which man's boasted wisdom stands utterly confounded; but their practical, beneficial, and astonishing results are no longer matter of question. Lime, in any quantity in which we might be glad to apply it, is too expensive a manure to be freely used among us; but no manure can be cheaper than gypsum; and its effects are very extraordinary. Its mode of application is still however, matter of experiment; and experiments here are greatly desired. On our alluvial lands its effects are said not to be apparent; on our hills in some cases most strikingly so. An intelligent farmer on the Hoosac river informed me that they had found the use of it on lands, where the growth was maple, beech &c. of no avail; but on their pine and oak lands separate from the other only by the river, immediate and valuable. To clover it is applied always with great advantage. Every well attested fact in regard to it deserves attention, and ought to be fully and exactly communicated to the agricultural public.

Another means of improving lands, the value of

which experiment has amply confirmed, is the intermixture of soils. What is properly called marl, an unctuous and calcareous clay which will effervesce on the application of acids, has not been found among us. A valuable deposit of it has been recently discovered in New Jersey, which the farmers are there applying with great advantage. In our primitive region it is perhaps not to be looked for. But we have peat, bog mud, sand, and clay in abundance in different parts of the country; and the application of clay to a sandy, and of sand to a clayey soil, is of obvious utility; and often of better and certainly more permanent effects than the most abundant dressings of animal manure. Some of our Deerfield farmers, I am told, have found the application of clay to a certain extent, as a top dressing on their grass grounds of great advantage; but I am not sufficiently advised on the subject to speak more fully. An intelligent farmer of Plymouth county,* whose authority I know from personal acquaintance, is to be entirely relied on, has practised with great success and to a considerable extent on this principle of the intermixture of soils; and has rendered his farm, at first quite inferior, one of the most productive in the county. He has given the details of his experience to the public in a dissertation; for which he was honored with the premium of the Massachusetts Agricultural Society; a dissertation, deserving the attention of every inquisitive farmer. [To be continued.]

COMMUNICATIONS.

For the New England Farmer.

CATTLE MARKET.

I OBSERVED in your paper of the 22d of January a notice, taken from a Vermont paper, that a hotel and yards for the accommodation of drovers had been built, and were just opened in Cambridge. If any thing more is intended, than their accommodation on their way to the great and ancient cattle market in Brighton, it behoves the public to consider, whether they will be benefited by dividing this market, and establishing another so near it. It is obvious that one great cattle market in the vicinity of the city, is a convenience and benefit to the public. It presents to the buyer, at one view, all the articles that are for sale, and gives to the seller the competition of all who wish to purchase, and brings the article to the consumer at the least possible expense. If two markets should be established, the buyer and seller must submit to the loss of half their market, or be at the expense of trying both, under the disadvantage of not knowing whether it will be best to buy or sell at the first they visit, or to take the risk of the other. They will often lose their best opportunity in running from one to the other. The cost will be enhanced to the consumer, without benefit to any party.

All, it is believed, will agree that one great market in the vicinity of the city is preferable to two small ones; that a second will distract and prejudice both buyer and seller, and in the end the consumer. The question then is, which shall be encouraged? Shall the one proposed to be established in Cambridge be adopted, or shall the old one be adhered to? It will not, we think, be deemed reasonable to abandon this ancient market, unless the new one proposed should offer superior and decided advantages. The cattle market at Brighton has existed for more than half a century.

* The Rev. Morrill Allen, of Pembroke, Mass.

It grew up and has been continued there, because found the most convenient place. It is at this moment the best cattle market in the United States, and is an honor to this State. A settlement has been gathered around it of persons who deal in it; a large and convenient hotel has been built, with yards and pens, for the accommodation of persons who bring cattle to the market, or resort there to purchase, and a new tenant has recently been placed in the house, whose character gives assurance of civil and courteous deportment to his customers, as well as good entertainment upon most reasonable terms.

Why then, it may be asked, should a new market be substituted, or the existing one be divided, and both injured. It may be said Cambridge is nearer for drovers from New Hampshire and Vermont; be it so, it is only a few miles at most, and this can be of little consequence in a journey of one or two hundred: Brighton is nearer for all persons coming from the western part of Massachusetts and Connecticut, and is much more convenient for all purchasers, more especially those who buy store cattle, sheep or swine, a great portion of whom, it is well known, live in the old Colony and the county of Norfolk, south and west of Brighton. Brighton is also a populous village, which affords great accommodation to both buyers and sellers, and many of its inhabitants depend on their business with that market, in a great measure, for their living; while the settlement near the hotel in Cambridge is comparatively thin.

We have made these remarks from no unfriendly feelings to the proprietors or projectors of the proposed establishment in Cambridge, for they are wholly unknown to us; but to draw the attention of persons who have been accustomed to deal as buyers or sellers at Brighton, to the subject. It concerns them, we think, seriously to consider whether their interest and convenience will be most promoted or prejudiced by dividing the market; and whether it will be wise to desert one they have long been accustomed to, where so much has been done and is doing for their accommodation, to build up another in its neighborhood, when the result must be two poor markets instead of one good one; for it cannot be expected the old one will be abandoned. It should also be remembered that changes, without cause, will discourage all permanent and expensive improvements, at any place.

For the New-England Farmer.

CULTURE OF FLOWERS.

MR. EDITOR, I envy not the individual who possesses no love for a garden, no natural taste for the cultivation of Flowers. What can be more pleasing to the human mind, than the contemplation of the infinite wisdom manifested by the Divine Being in the creation and arrangement of the vegetable world. For there is not a plant that grows, that does not possess charms sufficient to engage our attention, that has not something peculiarly beautiful in itself to excite our wonder and admiration. How transcendently beautiful is nature even in the least of her productions! Floriculture is an art calculated to interest and amuse every one who has a taste for it, and is willing to devote a little time in its pursuits. As a pastime for those engaged in other avocations, it is pleasant and instructive, and affords an unfailing source of delightful and wholesome employment. The

labor bestowed upon it is amply repaid, and our industry abundantly rewarded by the delightful fragrance and expanding beauties which are continually opening around us in a well cultivated and tastefully arranged Flower Garden. And it not only produces these most gratifying results to our senses, but it imparts a most enlivening vigor to our bodies, whilst it tends to elevate and expand our moral faculties and direct our minds in gratitude to God as the Creator of them all, at whose word they sprang into existence, and are presented before us as proper objects for our admiration and gratitude. Flowers are easily cultivated, and a thousand hues and species may be produced to ornament the grounds of the humblest cottage, as well as the most ostentatious dwelling. And besides the gratification and pleasure derived from the wonderful variety and succession of Flowers, let us not forget that he who so exquisitely formed and colored them, has added yet another charm in the delightful perfume contained in each variety.

And do not these reflections call up in our minds a useful moral, and teach us, that as these dazzling beauties which we so much admire will soon pass away and disappear, we should endeavor so to live, as that when the bloom of health, and advantages of youth are no more, we may supply their places with the fruit of usefulness and virtue.

TUFTON LODGE.

MASS. AGRICULTURAL SOCIETY.

MR. E. HERSEY DERBY'S CULTIVATION OF A PREMIUM CROP OF TURNIPS.

Salem, 28th Nov. 1833.

The Committee on Vegetable Crops:

GENTLEMEN, I wish to be considered an applicant for the premium offered by the Society for the best crop of Turnips. My crop was raised this season as follows:—The piece of land contains, as per the certificate of the surveyor, two acres one quarter and seven poles, sloping a little towards the south; the upper part of the piece is a light gravelly soil, the lower part of the same a good rich loam. The crop taken from it in 1832 was Indian corn, potatoes and winter squashes, with a common allowance of manure. Late this spring it was ploughed and harrowed and allowed to remain in that state till we had finished our English haying. About the 20th July, we carted on to each acre, and spread as evenly as possible, about ten ox cart loads of old manure left of the preceding year, each load drawn by a single yoke of oxen. The land was then ploughed and harrowed, which covered the manure and the growth of weeds. The seed was sown on the 26th or 27th of July by a drill barrow moved by a man walking at a quick pace in rows about two and a half feet apart. The seed was raised the present season by myself; the quantity sown on the whole piece did not exceed one and three quarter pounds, and was covered by passing the ox roller over the ground. There was a slight shower the morning we commenced sowing the seed, which gave the crop a fine start; and although my other crops suffered severely by the great drought we experienced about that time, the Turnips did not appear to suffer in the least. As soon as they were in the rough leaf we passed between the rows with a light scarifier drawn by a horse, to loosen the ground and destroy the weeds. About

a week or ten days afterwards the men went through them, thinned them out to single plants, and cut up what weeds they found with their hoes. Nothing more was done till we commenced taking them up on the 7th Nov.; between that day and the 23d we carted to the barns as follows: Thirty ox cartloads topped in the field, and twelve and a quarter loads untopped. The men were directed to have every load of the topped ones filled as nearly alike as possible; one of them was sent to the public scales and weighed, as per the certificate of the weigher 2525 lb. nett, which makes the thirty loads to weigh 75750 lb.; or at 56 lb. the bushel, as per the rule established by the Society, gives 1352½ bushels. On the 23d, thinking it imprudent to risk the remainder of them any longer in the field, I directed the men to pull all that were then in the field, and cart them with their tops to the barn, on which day we carted twelve and one quarter ox cart loads, each one of which was filled as full as could be piled on. Topping these, and carefully measuring each load, they were found to measure 377½ bushels, which added to the others gives for the whole crop 1730½ bushels. I expect to consume these turnips in feeding the different kinds of live stock on my farm the ensuing winter.

I am, gentlemen, with great respect,

Yours, &c.

E. HERSEY DERBY.

Essex ss. Nov. 29th, 1833.—Then personally appeared before me E. Hersy Derby, Esq. and made oath that the facts and allegations therein set forth, in the annexed statement, were true.

Before me,

JONATHAN P. SAUNDERS,

Justice of the Peace and of the Quorum.

Essex ss. Nov. 29th, 1833.—Then Lott Fenely personally appeared and made oath that the facts set forth in the statement annexed made by Mr. Derby, were according to his knowledge true.

JONATHAN P. SAUNDERS,

Just. of the Peace and of the Quorum.

Salem, Mass. Nov. 29th, 1833.—I certify having measured a lot of land, part of an enclosed piece of land of E. Hersy Derby, Esq. situated within his farm in South Salem, on which the past year a quantity of Turnips had been raised—and that the same land contained two acres, one quarter and seven poles.

JONATHAN P. SAUNDERS, Engineer, &c.

We, Lot Fenely, foreman on the farm of E. Hersy Derby, Esq., Thomas Boylan and John Reilly, laborers on said Farm, certify as follows: we were employed in pulling, topping and carting in a crop of turnips raised in one field this season, on the farm. We commenced on the 7th Nov., and between that time and the 23d Nov. carted to the barns thirty large ox loads of Turnips that were topped in the field: the loads were all filled as nearly alike as possible. The one sent to the public scales to be weighed was in every respect a fair sample of all the others. We also carted to the barns on the 23d Nov. twelve and a quarter ox cart loads of Turnips with their tops on from the same field, which on topping and measuring we found to contain 377½ bushels of Turnips without their tops.

LOTT FENELY,
THOMAS BOYLAN,
JOHN REILLY.

Salem, Nov. 29th, 1833.

Salem, Nov. 26th, 1833.

This Certifies, that a load of Turnips, driven by Lott Fenely, weighs 4120 gross, 1595 tare, 2525 nett lbs.

ABRAHAM TRUE, *Company Weigher.*

MR. PAYSON WILLIAMS'S CULTURE OF A PREMIUM CROP OF WHEAT.

To the Committee on Agricultural Experiments and Products;

GENTLEMEN,—In my statement on the culture of wheat the present season, I take leave to say, first, that the field sown, was the same on which a crop of 613½ bushels of potatoes were grown in 1832. In the April of 1833, the ground was ploughed *fine and deep*—19th, 2½ bushels of Black Sea wheat (the product of some brought from Smyrna by my brother, Capt. Stephen Williams, of Roxbury, which was grown on the abundant borders of the above mentioned sea; for a more particular description, I would refer you to my letter to the Editor of the Fitchburg Gazette, copied into the N. E. Farmer, and other Agricultural papers of the day,) was sown, harrowed in across the furrows, and rolled in. At harvest, the last of July, we found 800 sheaves, producing fifty-five bushels and three pecks.

I deem it would be of little consequence to send a statement on the culture of potatoes the present season, my process not varying from former practice, and being outdone by my neighbor Carter in the amount of crop, his being (as he informed me) 687½, mine no more than 625.

Your Ob't. servant,

PAYSON WILLIAMS, *Owner,*
JACKSON DURANT WILLIAMS, *Assistant.*

COMMONWEALTH OF MASSACHUSETTS.

Worcester, ss., Nov. 26th, 1833.

Then personally appeared the above named Payson Williams, and Jackson Durant Williams, made oath to the truth of the above certificate, by them subscribed.

Before me,
DAVID BRIGHAM, *Jus. of the Peace*

Expense of Cultivation.

| Threshing the crop | 10,00 |

\$ 41,62

I consider the grain and straw worth \$ 154,37
P. W.

This is to certify, that I, Philip F. Cowdin, being sworn surveyor in the town of Fitchburg, having measured a piece of ground for Payson Williams, Esq. of said Fitchburg, on which wheat grew the present season, and find the same to contain one acre and no more. Said ground was cultivated by said Williams of Fitchburg, in the County of Worcester.

Fitchburg, Nov. 20, 1833. PHILIP F. CORDIN.

MASS. HORTICULTURAL SOCIETY.

PROCEEDINGS OF THE MASS. HOR. SOCIETY.

At a meeting held at the Hall of the Institution on Saturday, Feb. 1, 1834, the following letter was read by the President.

Lansingburgh, 8th Nov. 1833.

SIR, In my communication to your society of July 19th and published in the 13th Number of the current volume of the New England Farmer, I promised myself the pleasure of making a further contribution of seeds and plants for the benefit of your justly noted Auburn.

Should not the beauty and variety of any of my offering give them any worth, still, I am well persuaded, you will appreciate the motive and approve of the spirit that promoted the throwing in my mite in support of so laudable an undertaking as that of the cemetery and garden of Mount Auburn.

I have sent this day, by one of our sloops, two bales and one paper bundle, with instructions to the captain on his arrival at New York, to put them on board the first packet for Boston, adding the name of the packet to this letter, and placing it in the N. Y. Post Office.

In bale A, will be found a bundle of—

No. 1. The Tree of Heaven—*Ailanthus glandulosus*.

No. 2. Three leaved Bladder nut—*Staphylea trifoliata*.

No. 3. Silver Abele—*Populus alba*.

No. 4. Gum Acacia.

No. 5. Snowberry—*Symphonia*.

No. 6. Variegated Willow—*Salix cuprae*.

No. 7. Strawberry—*Fragaria Vesca*.

No. 8. Senna—*Cassia Americallanda*.

A paper of Roan berries for planting—*Serbus aucuparia*.

In Bale B, will be found a bundle of—

No. 9. Black Willow—*Salix nigra*.

No. 10. Sweet Scented Willow—*Salix lucida*.

No. 11. Tree of Heaven, (large)—*Ailanthus glandulosus*.

No. 12. Judson Plum, very superior.

No. 13. Green Guage.

No. 14. Weeping Cherry.

No. 15. Sasafra.

No. 16. Hop Tree—*Ptelea trifoliata*.

No. 17. Dwarf flowering Horse Chesnut—*Mesembry anthemum crystallium*.

No. 18. Filberts.

No. 19. Pecan Nut—*Olivaformis*.

In paper bundle will be found—Double Sun Flower, Wild Rice, Skinless Oats, a box of Lobelia Cardinalis, (the box for the gardener) Job's Tears, Garden Cress, Perennial Hibiscus—*mutabilis*, and Patagonian Gourd.

Among the articles transmitted will be found a garden chisel for your individual use. In the succeeding spring I purpose to send you a seedling Dahlia of my own raising, to which, in approbation of your public and private character, I have taken the liberty to give the name of Dearborn.

I remain, very respectfully, yours, &c.

ALEXANDER WALSH.

Hon. H. A. S. Dearborn, }
Pres. Mass. Hor. Soc. }

Voted, That the thanks of the Society be presented to Alexander Walsh, Esq. of Lansingburgh, State of New York, for his valuable donation of trees, plants and seeds.

Voted, That the trees, plants and seeds presented by Alexander Walsh, Esq. be placed in the charge of the superintendent and gardener of Mount Auburn.

R. T. PAINE, *Rec. Sec'y.*

From the Maine Farmer.

LIME

—Has been found by Chemical analysis to compose a very considerable portion of the kernel of wheat. It has also been found that any considerable quantity of animal manure, applied to land where wheat is sown, has a tendency to cause it to grow rapid, and of course the sap bursts out, and it rots, as we call it; and when this takes place the kernel becomes shrivelled, and is rendered nearly useless; and no human means can prevent it, if we enrich our land largely with animal manure.—A previous clover crop ploughed in is enough to cause wheat to grow sufficiently large, unless we wish for straw instead of kernel. This cannot always conveniently be had when we wish to sow wheat. In such case it is desirable to place something on the soil which will cause it to grow, and not surfeit it. We learn that in Great Britain, nothing has succeeded so well as lime. The farmers there, within fifteen years, have by the proper use of lime, been able to procure 30 or 40 per cent. more of the golden crop, than formerly.

Why may not we use it to as much advantage? it is found among us plentifully, even in this town, if not so pure to use for plastering, yet abundantly so for to make wheat grow well. Therefore I propose that you, sir, or some one else, draw up a subscription paper, inviting our farmers to subscribe something, that funds may be raised to dig, burn, and prepare some of it for use early in the spring. I will not believe that we shall be unwilling to make the trial. I having made these suggestions and surely shall need do no more, except subscribe something to procure workmen, &c. there being no doubt the owner of the rock will be glad to have the trial made. EXPERIMENT.

Winthrop, Dec. 9, 1833.

APPLE TREES.

A GENTLEMAN in Essex, England, having in his orchard many old supposed worn out apple trees, which produced fruit scarcely larger than a walnut, last winter took fresh made lime from the kiln, slacked it with water, and (without allowing time for its caustic quality being injured by imbibing fixed air) well dressed the trees, applying the lime with a brush. The result was, that the insects and moss were completely destroyed, the outer rind fell off, and a new, smooth, clear one formed; and the trees, although some twenty years old, have now a moist healthy appearance. The same treatment may be extended to other fruit bearing trees, and probably with a similar beneficial result.

IMPROVEMENT IN THE MODE OF RAISING ANNUAL FLOWER SEEDS.

AFTER sowing the patch of seeds, and covering it with fine moist soil, place a garden-pot inversely over it, until the seeds have struck root; then raise the pot up two or three inches, keeping it thus supported for a few days, and then remove it entirely. The pot not only keeps the soil moist, but by the sun heating the pot, the seeds come up much more quickly than otherwise they would do, in consequence of which the seeds need not be sown so early by a fortnight or upwards. The young plants are therefore less exposed to injury from cold or late spring frosts. Hollow tiles, instead of pots, answer equally well, except where mice are, they have access to the ends.

Gardener's Magazine.

From the Northern Farmer.

SILK.

We have received, through the politeness of Mr. Simon Brown of this village, from Dr. Frost of Plainfield, in this county, a beautiful skein of sewing silk, of the produce of the Doctor's own little silk establishment the past season. This experiment, by Dr. Frost, has resulted in the establishment of certain facts, which may hereafter be of incalculable benefit to *Northern Agriculture*.

First:—That our northern climate presents no obstacles to the abundant production of the proper food of the silkworm; and that the temperature of our northern summers is not unfavorable to the growth, perfection, and instinctive industry of this wonderful little spinner of the most durable, as well as most elegant material of our wardrobes.

Second:—That the skill necessary to the profitable culture of silk, may be as readily acquired, and as easily reduced to practice, as the knowledge of other agricultural pursuits. These facts established; we are able to look forward, with the most confident expectations, to the time, when the silk culture will become a subject of general attention, and one of the principal sources of wealth in northern New England: for what cannot New England industry effect, when rightly directed? A farmer, beginning now, might in ten years, be able to throw into market many hundred dollars' worth of silk; and, at an expense of culture, much less than would attend any other product, to the same amount; and, at the same time, not diminish his profit from other sources.

TIMBER

—By the process of charring or burning the surface, may be preserved for an indefinite time, even though exposed to damp, or buried in the earth. The utility of charring timber used for posts or water works, is so evident, that we are surprised it is not more generally attended to. The most wonderful proof of the indestructibility of charcoal timber is given in *Watson's Chemical Essays*, where we are informed "that the beams of the Theatre of Herculaneum were covered with charcoal, by the burning lava which overflowed that city; and during the lapse of 1,900 years, they have remained as entire as if they had been formed but yesterday." This property was well known to the ancients, as the famous temple of Ephesus was built on piles charred to preserve them from decay; and some years ago, piles were found in the Thames, charred, in a perfect state of preservation, in the very spot where Tacitus relates that the Britons drove in piles, to prevent the attack of the fleet of Julius Caesar.

HUSK MATTRESSES.

In one of your late numbers, [vol. 3, p. 385,] I observed an article on the subject of Husk Mattresses. Permit me to suggest an important improvement. The preparation of the husk should be as you propose, but instead of using it alone, the following addition is far preferable. Prepare a layer of husk of the size you want your mattress, and then lay on a layer of *cotton batting*, of the ordinary thickness; then another thin layer of husks; then another of cotton, and so on, till you get your mattress of the desired thickness. Stitch the whole together, and cover with your ticking in the usual manner.

Mattresses made in this way, are full as good as the best curled hair beds, and I defy the closest

observer to tell the difference by sleeping upon them. I have used one during the last summer, made in this way, and can attest to their great excellence, as well as economy.—*Gen. Farmer*.

YEAST.

Good housewives, who take pride in setting sweet and light bread before their families, feel vexed at nothing more than bad yeast. And they are sometimes put to a great deal of trouble in procuring a good article. The following is said to be a good recipe for making it: Boil one pound of good flour and a quarter of a pound of brown sugar, and a little salt in two gallons of water for one hour. When milk warm, bottle it and cork it close, and it will be fit for use in 24 hours. One pint of the yeast will make 18 lbs. of bread.

WHY DOES SOAP CURDLE WITH HARD WATER.

The sulphuric acid of the sulphate of lime, to which it generally owes its character of hardness, combines with the soda of the soap. The lime and oil or tallow, being thus freed from their respective combinations, float through the liquid medium in flakes; the phenomenon, therefore, is one entirely of decomposition. On this principle solution of soap will determine the relative hardness of water and is generally employed by the well digger.—*Murray's Manual of Chemical Experiments*.

From the Northampton Courier.

QUITE DOMESTICATED.

THE docility and domestic habits of Cows are quite amusing sometimes. There is a venerable old pet creature in this town, who is accustomed to steal a march of the family with whom she resides and eat up the miscellaneous matter deposited in the kitchen. She occasionally walks into the back part of the house and from thence into the larder, and after seating herself on some humble stool, quietly fills her stomach with any culinary matters which happen within her reach. She always has a good appetite, and never takes hot sling or early bitters to create one. The other morning it was found during the night she had eaten up what was designed for the breakfast table, a goodly mess of codfish and potatoes; and at another time she stowed away in her bread-basket a large quantity of baked pork and beans. A few days since, she walked into a neighbor's kitchen and ate up a number of fresh loaves of bread and then returned home and swallowed a quantity of butter, enough to spread them with. She's a nice beast, and yields, in the proper season, sixteen quarts of milk in a day, and withal has a touch of somnambulism about her.

BLACK TONGUE.

We scarcely open a newspaper from the country, without meeting a paragraph or a communication respecting a disease in horses and cattle called the *Black Tongue*, or the *Burnt Tongue*. It is said to prevail chiefly among horses, but is not uncommon among cattle. Some respectable physicians have given their opinion, that if any person who was taking care of animals afflicted with this distemper, should get any of the matter of the diseased tongue into an eye or a flesh wound, it would be a very serious affair, and might prove fatal. We have heard that several persons in the country are now suffering under an inflammation from this cause.—*Boston Courier*.

CHARCOAL.

THERE is a peculiar temptation during these long and bitter wintry nights, on exchanging the snug comforts of the warm hearth for the shivering frostiness of apartments unoccupied during the day, to resort to some method for raising their temperature at once. One of the first expedients has ever been to introduce a pan of burning coals for this purpose; and notwithstanding the repeated warnings which have been read to the public each succeeding winter, many still persist in this dangerous practice. The consequences are not the less fatal because they are gradual. In a tight room, the carbonic gas escaping from combustion soon renders the air unfit for respiration, a benumbing lethargy succeeds to drowsiness, and the devoted sleeper seldom awakes to a consciousness of his danger. Many an untimely death has been the consequence of heedlessness in this respect; and we would again urge caution upon parents and housekeepers in regard to it. The addition of a pair of Dutch blankets, or an extra *comforter*,—the appellation though homely is appropriate, blessings to its inventor!—would be a far better substitute. These remarks have been more particularly suggested at this time by the melancholy account of the recent death of two young ladies, who were stifled by the mephitic vapor generated by the introduction of burning charcoal into their sleeping apartment.—*Detroit Courier*.

ANIMAL WEATHER GLASS.

In Germany there will be found, in many country houses, an amusing application of zoological knowledge, for the purpose of prognosticating the weather. Two frogs are kept in a glass jar, about eighteen inches in height, and six in diameter, with the depth of three or four inches of water at the bottom, and a small ladder reaching to the top of the jar. On the approach of the dry weather, the frogs mount the ladder—but when wet weather is expected, they descend into the water. These animals are of a bright green.

From the New-York Farmer.

REMEDY FOR THE BLACK TONGUE IN HORSES AND CATTLE.

I SEE by the papers that a disorder called the Black Tongue is making fearful ravages among the cattle, horses and hogs, in various parts of our country. I believe this disorder may be cured. Take half an ounce of gum gamboge, 1 ounce of aloes, 2 drachms of calomel, reduce to fine powder, add flour and water until it is of the consistence of dough, divide into 10 balls of the size of a hen's egg,—give one ball night and morning for a week.

To give the balls, take hold of the tongue with the left hand, draw it out about 2 inches, then with the right hand lay the ball on the root of the tongue. Let go with the left hand, and the tongue will recede, so that the creature cannot avoid swallowing it. If much fever, take 1 oz. ipecacuanha, pour on it a quart of warm but not boiling water, take $\frac{1}{2}$ pint of this tea, and put it in a bucket of water; let the horse drink freely. But in most cases the balls will do the work without the ipecacuanha. For hogs, take $\frac{1}{2}$ oz. gum gamboge, 1 oz. saltpetre, 4 quarts charcoal powder, 4 do. fine salt—a pint of this mixture in a barrel of swill, and give as usual. I have tried it for 20 years, always with success—have given it to cattle and sheep in lieu of salt, and found it a preventive of diseases which have destroyed many cattle of my neighbors. R. M. W.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, FEB 5, 1834.

WINTERING SHEEP, CARE OF LAMBS, &c.

GIVE your ewes with lamb somewhat more than their usual quantity of food for a month or six weeks before they are expected to yearn. They should not be fed so as to fatten them, for if they are in high condition they will be more apt to suffer in becoming mothers, and will be less fit for nurses. It is a good practice to give about half a gill of Indian corn a day to each sheep with lamb for some time before and after they have yearned, and roots may be advantageously added after that period. The *Farmer's Manual* says, "If you have stored more turnips than are sufficient for the use of your table, give them to any stock that will eat them except your sheep; give to them potatoes, but not turnips at this season, they will injure the lambs."

If your sheep, whether store sheep or ewes with lamb have good hay, about a quart of potatoes a day to each will, it is said, be very beneficial, and an ample allowance. But when the object is to fatten them, according to a writer in Rees' Cyclopaedia, about a gallon of potatoes a day with a little hay will be the proper quantity; but this depends in part on the size of the animals, and in part on the quality and quantity of the hay which is given them. Potatoes, beside their use as food for sheep, are said to be very serviceable as an article of diet, which usually supersedes the necessity of medicine. They have, when given raw, an opening quality, which is said to answer a similar purpose with sheep, which is effected with swine by brimstone and antimony. Potatoes baked, steamed or boiled will furnish more nutriment than those which are raw.

Care should be taken to place in the stable small tubs or troughs of water for the sheep to drink in. They will do very well in summer without water, as they feed when the dew is on, but they need water in winter, especially if fed mostly with dry food. "When sheep have colds, and discharge mucus from the nose, good feeding, together with pine boughs given occasionally, will probably cure them; or tar, spread over a board, over which a little salt is strewed, which will induce sheep to lick up the tar, and this will cure a cold."

"When several kinds of food can be procured, it is right to give them alternately to the sheep at different meals, in the course of the same day; the qualities of one kind aid or compensate those of another. At certain hours of the day dry fodder should be given, and at others roots or grain. If there be any danger that the roots may decay, the winter should be begun with them, mixing, however, some dry food with them, for alone they would not be sufficiently nutritious."

Sheep should have a yard by themselves, its size adapted to the number of the flock. They require shelter overhead, but its sides should not be so close as to confine the air. The rack from which sheep are fed with hay should be upright, so that the seeds, &c. may not fall into the wool about their necks. Under the rack a trough should be fixed, which will serve at once for catching the seeds of the hay, and for feeding the sheep with roots, &c.

If the flock be large, or over about fifty, a sep-

aration of it during the winter is desirable for promoting the health as well as the comfort of the animals. The full grown wethers should be put by themselves, and will not require so good keeping as the ewes and last year's lambs. A suitable apartment should likewise be provided for such sheep as by reason of age, sickness or infirmity require extra attention. Sheep require but little if any salt in winter, and there are reasons for believing that a too free use of salt has been the cause of sickness and death in sheep.*

M. Tessier observes, that "Sheep have been known to be attacked with long and troublesome looseness in consequence of having taken too much salt; which has induced a belief that sea water is poisonous to them; and that his sheep have always been healthy, though he had never given them salt, but he states that it may be indispensably necessary in wet countries."

SUBSTITUTE FOR SWEET POTATOES.

THE cocoanut squash, cut into pieces, and roasted like sweet potatoes, is found to be fully equal to them, and so closely resembles them in flavor that it would be difficult to distinguish between them. It grows freely in this climate, and may be kept till mid winter.—*Goodsell's Farmer*.

ITEMS OF INTELLIGENCE.

A Fact. In conversation with one of our most respectable lawyers, he informed us that in the course of his practice here, he had been engaged in the trial of nineteen persons for the crime of murder, and that of these nineteen cases, *seventeen* were the consequences of *INTEMPERANCE*, in one or the other of the parties concerned.—*St Louis Obs.*

Great Gale at Buffalo. The Albany Argus publishes a letter from Buffalo, stating that the most severe gale of wind ever known in that place, passed over that town on the afternoon of the 12th inst. Many buildings were unroofed and otherwise seriously injured, chimnies blown down, carriages overturned, &c. The water of the lake was raised considerably, and much damage done to the wharves, store houses, and some of the vessels.

The Chemical Bank of New York, which keeps, perhaps, more small accounts than almost any other in the city, of persons engaged in retail business, and of mechanics, has from some unfounded cause, been run upon for a day or two; upon learning which, the Branch Bank made them a loan of \$100,000.

Great Storm in Georgia. The Macon stage left that place on Saturday last, and arrived in this city yesterday evening,—seven days on the route. The contractor, who came through, informs us, that the roads were literally blocked up with trees, that had fallen under the incumbent masses of sleet which they had accumulated during the late inclement weather. The number of trees which were cut away and removed, with the assistance of the passengers, is estimated at about one thousand. The roar of the falling trees, and the crashing of the limbs as they resounded through the woods, are represented to have been alarming and astounding. In addition to these obstacles, the stage had also to encounter the swollen water courses, which had risen above their banks and inundated the country. The injury sustained by the Ogeechee bridge, noticed in our last, has been greater than was reported—two arches, we understand, have been entirely swept away. We fear the planters have suffered severely.—*Savannah paper Jan. 11.*

The last number of the American Rail Road Journal, contains an account of a sort of *amphibious* locomotive recently invented, which it is said will operate alike expeditiously on land or in water. It is shaped like an alligator, the head and tail projecting upwards, with land wheels near the ends, and water wheels near the centre.

A Manual Labor School for colored young men and boys, will be opened on the 1st of May, in the village of Peterboro', Madison co. N. Y.

The U. S. Army, as now constituted, comprises 6,412 men, viz: dragoons 393; artillery 1,789; infantry 3,225: recruits and unattached soldiers 73. The whole number of recruits, including dragoons, entered from 1st Jan. to Sept. 30th, 1832, is 2,036.

The number of fires in Philadelphia during the past year was thirty-six. Loss of property thereby \$60,172; insurance effected upon it, \$21,252.

NEW WORK.

LILLY, WAIT & CO. and GEO. C. BARRETT,

Will Publish this Month the First Volume of

THE COMPLETE FARMER

AND RURAL ECONOMIST,
Forming a Compendium of the most important
Branches of Agriculture and Rural Economy.

BY THOMAS G. FESSENDEN, ESQ.

Editor of the New England Farmer.

THE Editor and Publishers have been induced to offer this work to the Public in consequence of the great and increasing demand for information on the subjects which it is intended to embrace, with a hope that it may prove useful to the Agricultural and Horticultural community, in whose pursuits all mankind have a direct and obvious interest. It is intended to form a Compendious Directory to the Farmer, Gardener, Florist, and Rural Economist, and to be so arranged that every article may be readily referred to.

VOLUME I.

The First Volume will be devoted to AGRICULTURE, in its various branches, embracing the following among other topics:

| | | |
|--------------|--------------|-------------------|
| Soils, | Manures, | Dairy, |
| Grasses, | Hemp, | Sheep, |
| Grains, | Flax, | Swine, |
| Indian Corn, | Neat Cattle, | Poultry, |
| Wheat, | Horse, | Woodland, &c. &c. |
| Fences. | | |

VOLUME II.

The Second Volume will be devoted to HORTICULTURE, in its various branches; also, SILK, BEES, RURAL ECONOMY, &c. In this volume, the following will be among the number of topics embraced in the treatise:

| | | |
|-----------|-----------|----------------|
| Garden, | Hot Beds, | Insects, |
| Orchards, | Mulberry, | Rural Economy, |
| Fruits, | Silk, | &c. &c. |
| Vine, | | |

To each volume will be added a list of the best Implements in use, and drawings of the most important and improved kinds will be given.

CONDITIONS.

The work will be comprised in two volumes, royal 12mo. of 350 pages—price \$1 a volume;—and either volume may be had separately, as they will be entirely independent of each other.

To persons at a distance remitting \$5 by mail, *post paid*, to either of the undersigned, shall be delivered at any post office in the United States 5 copies of either volume *free of postage*, sewed and done up in strong cloth backs and in good order.

For \$1, remitted free of postage, shall be sent one copy of either volume, *postage unpaid*.

Subscriptions solicited, by LILLY, WAIT & CO. 121 Washington street, and GEO. C. BARRETT, Publisher of the New England Farmer, Nos. 51 & 53 North Market Street, Boston.

* Deane's N. E. Farmer.

† Tessier's Treatise on Sheep.

* See N. E. Farmer, vol. xi, p. 246.

ITEMS OF ECONOMY, &c.

For Sore Throat. Put a half pound of figs into a quart of water, and boil it to a pint—then open and strain the figs. Add two table spoonfulls of yeast, and the same quantity of honey. Gargle the throat with this liquid, and a cure is certain.

An excellent Cure for a Sprain.—Take two pieces of red flannel, soak one of them with beef or pork pickle, (beef is best) and place it on the wrist, or ankle sprained, wrap the other piece over it and the pain will subside in a very short time.

Mr. William Carver, one of the oldest and most experienced Farriers of this city, who has written many newspaper articles and pamphlets against cruelty to horses, says: "no horse is worth so much by 25 per cent, with his tail cut off."—*Philad. paper.*

Dams.—In New York and Pennsylvania, where they have done a good deal in the way of internal improvements, dams to improve the navigation of rivers which are shallow or rapid, are quite common. They substitute smooth deep water for shoals and rapids. Such dams are erected on the Hudson, the Schuylkill, the Oswego, and many other rivers, with uniform success.

BRIGHTON CATTLE FAIR HOTEL.

THE subscriber has taken a lease of the Brighton Cattle Fair Hotel, and has conditioned in his lease from the Directors approved at a meeting of the corporation, to use his best exertions to keep an orderly, well provided, and well attended House of Entertainment for Public Accommodation. He feels no disposition to inter ere with the rights of any men or body of men associated for the purpose of drawing custom from this establishment, but it, as he is informed, for the purpose of accommodating the public, particularly the Drivers and Dealers at this market, who have frequented it for many years past. But he will pledge himself to the former customers, to the present customers, and to all who may hereafter favor him with their patronage, to endeavor, so far as in his power, to deserve it, by constant and unremitting attention on his part, the only means he has to obtain and secure it.—Those persons throughout the Commonwealth, and in the neighboring and other States in the Union, and all whose business leads them to Brighton, are requested to make favorable notice of this advertisement, and oblige their obedient servant,

Z. B. PORTER.

For Gentlemen and parties from the city will also find good accommodation, and every thing usually found in an establishment of this kind.

Brighton Cattle Fair Hotel, Feb. 5, 1834. if

BRIGHTON CATTLE FAIR HOTEL.

THE Directors of the Cattle Fair Hotel, have the pleasure of announcing to the public, that they have selected a gentleman to conduct their house, (Mr. Z. B. Porter) who, in their opinion is well qualified; possessing a proper sense of morality, with obliging and active habits, which fits him in a peculiar manner to conduct an establishment built by the patriotic contribution of gentlemen, whose only object was to establish good accommodations for the great public to transact their business in, and as a pleasant resort for innocent amusement. With these impressions, the Directors recommend him to the public patronage, with a determination to render the establishment what the public convenience requires.

By order of the Directors, CHARLES HEARD, Clerk.
Brighton, Feb. 5, 1834. if

THE GREAT BULL HERCULES

—Will be sold at auction on Saturday, Feb. 8, at 12 o'clock. M unless previously sold at private sale.—Weight 3375 lbs. For size, form and figure, this animal excels any ever produced in America. He was raised in Greenland, N. H. is of the full blood short horned Durham breed, celebrated throughout Europe and America, is six years old and in perfect health.

The above named animal may be seen together with a Bull and Cow of the East Indian breed named Zebus, the smallest of the cattle kind, the pair weighing only 350 lbs. and the first ever exhibited in this city. Also, two living alligators, with a variety of other animals.—At the exhibition room in Flagg Alley, opposite the south west corner of Faneuil Hall, until the day of sale. Admission, 12½ cts. Jan. 29.

BLACK SEA SPRING WHEAT.

For Sale at the Seed Store of Mr. Geo. C. Barrett, North Market Street, Boston. As this variety of Wheat produced the past season 55 bushels to the acre on the Farm of the subscriber and its flour being of a very superior quality, he deems any other recommendation unnecessary.

PAYSON WILLIAMS.

Fitchburg, Jan. 22, 1834.

NEW ENGLAND SEED STORE,
AND HORTICULTURAL REPOSITORY

THE Subscriber having made enlargements in the business of the above Establishment, is now enabled to furnish Traders and others with

GARDEN, GRASS AND FLOWER SEEDS,

upon very favorable terms, and of the growth of 1833; and the Garden Seeds warranted of the best quality.

The greatest care and attention has been bestowed upon the growing and saving of Seeds, and none will be sold at this establishment excepting those raised expressly for it, and by experienced seedsmen; and those kinds imported which cannot be raised to perfection in this country: these are from the best houses in Europe, and may be relied upon as genuine.

It is earnestly requested whenever there are any failures hereafter, they should be represented to the Subscriber; not that it is possible to obviate unfavorable seasons and circumstances, but that satisfaction may be rendered and perfection approximated.

Boxes of Garden Seeds, neatly papered up in packages for retailing; and dealers supplied at a large discount.

GRASS SEEDS, wholesale and retail, at as low prices as can be bought in Boston, as arrangements have now been made to obtain the best and purest seed.

Catalogues sent gratis to applicants, and Orders solicited early, as better justice can be done in the execution.

N. E. Seed Store, connected with the N. E. Farmer Office, No. 51 & 52 North Market-st. GEORGE C. BARRETT.

MANUAL OF THE MULBERRY.

Just published, the second edition of Cobb's Manual, containing information respecting the growth of the *Mulberry Tree*, with suitable directions for the culture of *SILK*, in three parts. This edition is an improvement. Price 50 cents. For sale, by GEO. C. BARRETT, N. E. Farmer Office.

5000 WHITE MULBERRY TREES.

For Sale by JOSEPH PRINCE, of Grafton, Worcester Co. 5000 *White Mulberry Trees*, of vigorous growth, and being the same that obtained a premium of the Worcester Co. Agricultural Society.

WANTED.

A faithful young man (unmarried) who can come well recommended, to take the work of the Farm and Garden of a small family. Apply at this office.

COTTON GOODS

AT REDUCED PRICES.

ELIAS STONE BREWER, 414 Washington st. (South End) offers for sale, the largest assortment of COTTON GOODS, to be found in any retail store in the city, at very reduced prices, viz.

| | |

BRIGHTON MARKET.—MONDAY, FEB. 3, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 437 Beef Cattle, 312 Sheep, and 160 Swine.

PRICES. *Beef Cattle.*—The quality of the Cattle this week was better than it was last week, consequently about the same range of prices were obtained: purchasers held back until afternoon. We noticed 8 or 10 yoke, very fine, taken at \$6. We quote prime at 5 50 a 5 75; good at 4 75 a 5 25; thin at 4 45.

Sheep.—We noticed two extraordinary fine Wethers taken by Mr. Abel Burditt for \$30; a lot of fine Wethers for 5 67, and a lot for 5 75; a lot of inferior quality were taken, price not known to us.

Swine.—Sales quick; 3 or 4 small lots of Barrows were taken at 6c. and Sows at 5c. At retail, 5c for Sows, and 6 for Barrows, for those weighing over 100; less than 100, 5 1-2 for Sows, and 6 1-2 for Barrows.

SOUTHERN CLOVER,

GROWTH of 1833, just received by G. C. BARRETT.

MISCELLANY.

THE FARMER.

ALL the toils of summer o'er,
Peace and plenty round his door,
Who on earth so blest and free
As the Farmer?—Like the bee,
All the sweets of life are his—
Large and full his cup of bliss—
Who can envy thrones to kings,
When the Plough such treasure brings?

See his works with profit crown'd—
Barns, with hay-stacks buddled round,
Like a family, whom fear
Draws within a circle near;
Stately steeds and cattle neat,
Cribs of corn and mows of wheat.
Thickly peopled is his fold,
Harmless sheep and lambs behold,
Like the Christian 'midst the din
Of a noisy world of sin.
Fowls oviparous cackling round,
Paired with one foot on the ground,
Meet their master as he comes,
Cluck their wants and shade their plumes.
When at midnight all is still,
Hear the geese with voices shrill,
At the silliest thought of harm,
Raise the tocsin of alarm;
While from all the barn-yards round,
Echoes back the screaming sound.

See the lofty turkey-cock,
Monarch of the feathered flock,
Like a haughty potentate,
Strutting round the yard of state,
Filled with anger, fierce and dread,
At the sight of daring red,
Swelled and gobbling as he goes,
Dire destruction on his foes—
But like other tyrants, he
Soon will lose his head, you'll see.

Ere the morn unlocks her doors,
Whence a stream of day-light pours,
Ere the bacchanalian goes
From his cups to seek repose,
Hear the game-cock's clarion peal,
Breaking sleep's mysterious seal,
Like a summons from the skies,
Calling mortals to arise:
While each faithful sentinel,
Answers loud that "all is well."
Industry obeys the call,
Rises, hastens to the stall,
And replenishes with food
All his stock, and all his brood,
Who around him gladly fly
To a bountiful supply.
Back the husbandman returns,
Where his fire now briskly burns,
Where the partner of his joys—
Ruddy girls and healthful boys,
Kneeling with him round the chairs,
Send to heaven their matin prayers,
Thus the year with him begins,
Thus the race to heaven he wins.

PERIODICAL AUTHORSHIP.

THERE is no labor more destructive to health than that of periodical literature, and in no species of mental application, or even of manual employment, is the wear and tear of body so early and so severely felt. The readers of those light articles which appear to cost so little labor in the various publications of the day, are little aware how many constitutions are broken down in the service of their literary taste.—*Dr. Johnson.*

ITALIAN MUSIC.

AN Italian singer on a certain occasion, offended a Venetian nobleman. The singer, to avoid his fury, went to Rome. He was followed by two assassins, who arrived at Rome one evening when he was giving a concert. The assassins determined to murder him when the people came out of the church, and went in to watch their victim. Scarcely had they listened for a few moments to his delightful voice, than they began to soften; they were seized with remorse; they melted into tears, and when he came out, they assured him that he owed his life to the impression which his voice had made upon them.

POWER OF THE PRESS.

THE two Napier presses worked by steam, now employed by the New York State Tem. Society, can, if driven to the extent of their power, throw off twelve millions of Temperance Recorders per year; and from present indications from all parts of the Union, they will not lack employment.

INSULT.

I do not know how you will relish it, said a subscriber who was owing us a couple of dollars, but I shall venture to insult you, by offering you a dollar now, which is all the cash I have by me. We assured him that no offence was given, and that we would be perfectly willing to receive such insults every day—always pocket them.—*Eric Obs.*

HIGH PRICES.

THERE was once a country store keeper, who was remarkable for the high prices he charged for his goods. A customer calling one day, found the store open, but no one in attendance. After waiting a few moments, he inquired of a neighbor where Mr. Cambrie was. "Gone over to —," (a distance of about ten miles.) "What! and leave his store open?" "Yes—his goods are marked so high, he knows that the one who steals them gets a hard bargain at that!"—*Lowell Times.*

A SENSIBLE HORSE.

WE do not think the records of instinct ever contained a more extraordinary instance than we are now about to relate, and for the truth whereof we pledge ourselves. A few days since, Mr. J. Lane of Fawcett, in Gloucestershire, on his return home turned his horse into a field in which it had been accustomed to graze. A few days before this, the horse had been shod all fours, but unluckily had been pinched in the shoeing of one foot. In the morning Mr. Lane missed the horse, and caused an active search to be made in the vicinity, when the following singular circumstances transpired. The animal, as it may be supposed, feeling lame, made his way out of the field, by unhooking the gate with his mouth, and went straight to the same farrier's shop, a distance of a mile and a half. The farrier had no sooner opened his shed, than the horse, which had evidently been standing there some time, advanced to the forge, and held up the ailing foot. The farrier instantly began to examine the hoof, discovered the injury, took off the shoe, and replaced it more carefully, on which the horse immediately turned about, and set off at a merry pace for his well known pasture. Whilst Mr. Lane's servants were on the search, they chanced to pass by the forge, and on mentioning their supposed loss, the farrier replied, "Oh, he has been here, and shod, and gone home again," which on their returning, they found to be actually the case.

Portland Advertiser.

ROMAN MORALS.

"In the business of razing and plundering cities, there ought to be taken a very special care that nothing of rashness or cruelty be shown."

Cicero's Offices, Book I, § 24.

100 BUSHELS TIMOTHY SEED,
GROWTH of 1833, just received at G. C. BARRETT'S
Seed Store, Nos. 51 & 52 North Market Street.

NOTICE.

A young man, 25 years of age, bred a farmer, and is capable of overseeing and laboring on a Farm, wishes for employment in the above business. Letters post paid, and addressed to Moses Field, Northfield, Mass., will be attended to. Testimonials of good moral character and ability, can be given if necessary. 31 Jan. 29.

TO BE LET

THE whole, or part of a Farm, in the vicinity of Boston, containing about 95 acres of good land, with a convenient House, Barn, and out houses—of which possession may be had on the 1st of April next—Provided application is made by a capable, steady and industrious man, of good moral character, and who has been educated in the business of Farming, and who will produce a good recommendation of such qualifications—and none other need apply.

For further information, enquire of the proprietor and publisher of the New-England Farmer, at his Office, Nos. 51 & 52, North Market Street, Boston.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Albears, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

VOL. XII.

BOSTON, WEDNESDAY EVENING, FEBRUARY 12, 1834.

NO. 31.

AN ADDRESS

BEFORE THE HAMPSHIRE, FRANKLIN AND HAMPDEN AGRICULTURAL SOCIETY;

Delivered in Greenfield, Oct. 23. 1833. By HENRY COLMAN.

PUBLISHED AT THE REQUEST OF THE SOCIETY.

(Concluded from p. 234.)

THE next means of improving your lands is to extend your cultivation. The more produce to be consumed, the more manure to be applied; and so the enriching and improvement of your land may be kept on in a continually accelerated ratio. I am aware that the proposition to extend your cultivation, with a view to the improvement of your farms, will be received with distrust; this will excuse me for dwelling upon it more at large. I will give you my opinion; and shall be happy to be corrected by your better judgment.

I admit that in general it is a good rule in husbandry, to cultivate no more land than you can manure well; and to manure well and tend well all you do cultivate. I would recommend it as strongly as any one; but under peculiar circumstances there are excepted cases to every rule however reasonable. Your farm is run down and impoverished. You wish to restore it; to wake its dormant energies; and, if possible, to make it stand upright again. Agricultural improvements are always slow. It requires a year to accomplish the most simple experiment; and often many years to effect any extraordinary alteration. But there must be a beginning, and the first step in any valuable undertaking is commonly difficult and discouraging. When Ledyard, a lad animated by the indomitable spirit of adventure, first launched his frail canoe, more than a hundred miles from this spot on the waters of the Connecticut, to him an unexplored stream, it required a bold heart to push from the shore into the descending current; but as he was borne along its winding and fertile banks, he was cheered by the consciousness of his onward progress and triumphant adventure; and continually more and more animated by the hope of farther knowledge, success, and power. This confidence of progress, this hope of ultimate success, certain to persevering and judicious labor, is the great encouragement, which is to sustain us.

Let us suppose then, that you have an impoverished acre of land, and at present no manure to apply to it. What is to be done! Perhaps it will bear rye, the crop which seems to demand less of the soil than any other; and will put up with the meanest fare. At present it gives you comparatively nothing. Sow it then with rye and clover; plaster it; gather your rye; perhaps you will not get back even your seed. Now use the straw carefully for litter, and convert it either by means of your swine or cattle into manure; plough in your clover, if there is any of it, after it has gone to seed: apply the manure be it more or less, which you obtained from the straw gathered from this acre, and be careful not to cheat the land of any thing that belongs to it. Sow it again with rye and clover and repeat the same process. The second crop may be expected to be better than the first; and, though the returns may for some time be small, they will be continually increasing, and will soon be a full return for the labor and expense applied. Your land will be in a course of improve-

ment, and your means of enriching your soil will be increasing in a correspondent proportion. If in addition to this you can as I before remarked, depasture such clover with sheep; and enrich such land by the addition of some soil in the neighborhood suited to its improvement, the balance of such husbandry will be in the end greatly to your advantage. This is one process, which may be adopted without any great outlay to the improvement of worn-out lands, where manure is not to be obtained; but there are other modes, and other crops by which it may be effected, which the time does not allow me to particularize.

There is another ground on which farmers, whose whole profession and business is husbandry, and who are looking to its fair returns as an honest compensation for their labor, should be urged to extend their cultivation. If any portion of your land is absolutely worthless; and you are satisfied that by no process, which you can apply to it, you can ever obtain an equivalent for the labor employed in its cultivation, then indeed for cultivation let it be abandoned, or appropriated to any purpose in which it may yield something, and the most that it can be made to yield.

There is likewise land, which is in permanent meadow; and which by no cultivation can be made so productive as in its present condition.—Leave this, then, as it is. It would be very injudicious to disturb it. But on many farms there is some land, which is turned into pasture and affords but a scanty supply to the animals, which are fed upon it; or which remains in mowing, yielding a small crop of hay, which by cultivation might be made to yield good crops of corn, potatoes, and grain; and then be rendered far more productive of grass than in its present state. I believe there is much land in this condition; and this induces the complaint, that our farms are too large for a profitable cultivation. Why should such land remain uncultivated? Why should you be satisfied with less than half a crop. What would you say of the capitalist, who was bent upon increasing his fortune, who permitted any portion of his capital, which he could use without loss, to remain in his coffers unemployed? What should we say of the manufacturer, who should suffer any portion of his power to run to waste, or of his machinery to be unemployed, or of his raw material to lay by, in useless accumulation, when it might all be employed to more or less advantage? He might by such a process, consult his ease, but certainly not the advancement of his fortune. We can say nothing different of the farmer, who permits any portion of his grounds to remain unemployed; or who neglects to obtain from them all that they can be made to produce. We believe that there is little land of a kind which may be cultivated without loss, but what may, by judicious and persevering labor, by a process within the power of the farmer, whose means are restricted and humble, be placed in a course of certain improvement, and afford a fair profit to his exertions.

The answer commonly given to these suggestions is, that labor is so expensive we cannot afford to cultivate our land. I admit that the expense of labor is very high compared with the value of produce. Yet I cannot but believe, in circumstan-

ces ordinarily favorable, and where the price of land is not exorbitant, the man, who attempts to thrive by the plough, and does himself either "hold or drive," if his management is judicious and persevering, and his habits frugal and temperate, will obtain a fair compensation for his labor and pains. If then, the balance of his cultivation is, upon the whole, in his favor, why should he not extend it as far as it can be extended to advantage? Why should he permit a single acre of his land to remain unproductive, which may be made productive? if he can plant ten acres to advantage, why not plant twenty? if he can produce two hundred bushels of corn, why should he not attempt to raise five hundred? in short, why should he not carry his cultivation to the utmost limits of a profitable return? Beyond that, certainly we would not advise him to go. Under such circumstances he engages in no dishonorable competition; his gains are at no other man's expense or loss; on the contrary, he contributes essentially to the general good, as the increase of his produce tends in a certain proportion, to lessen its price in the market; and renders, therefore, the comforts and supplies of life more accessible to the poorer classes of the community, and certainly not less so to the richer.

This brings us to the great subject of the proper size of farms. It is often said that an acre of land well manured and cultivated, is better than two acres poorly or imperfectly manured and cultivated; but it is not so good as two acres well manured and cultivated; nor is it so good as two acres poorly manured and cultivated, if the profit from the two acres, is, after all expenses are allowed, greater than the gain from the one acre, though not in an equal proportion. He is the best farmer, as far as agriculture is considered in a pecuniary view, whether he cultivate much or little, who obtains the greatest amount of produce, at the least expense.

A farm is too large, when from its size, any part of it is necessarily left unproductive and uncultivated; or if from its extent, its owner or landlord is incapable of its careful superintendence. But a farm is not too large, when its perfect and exact superintendence is practicable to its owner; when every part of it is made as productive as the nature of the case admits; when upon the whole result it yields a fair remuneration; and no part of it can be withdrawn from cultivation, without a diminution of its profits. Farms are often too large; too large for the capital which the owner is able to apply to the management, for a successful agriculture can no more be prosecuted than a successful manufacture of any kind can be prosecuted, without a considerable floating capital; and they are often too large for the superintendence of a single individual, for the management can seldom be divided, or any part of it neglected without loss and injury; but it is to be remembered that large farms are always cultivated at a much less proportional expense than small ones. The expenses of outfit in regard to utensils, team and its appendages, and a great variety of necessities, is by no means double on a farm of large size, to what it would be on a farm of half the extent. Many advantages are found on a large farm from the division of labor, which is practicable among a number of hands,

and from the convenience of having a number of laborers at command, when any pressing emergency occurs; and from the opportunity of constant use of all the brute labor to advantage on a large farm, which is not possible on a small farm; though it may be that the same amount of team must be supported. The larger the farm, if well managed, the greater the profit; and in the kind of farming of which we are treating, the amount of profit obtained, after the amount of debit and credit is fairly adjusted, must be the test of its excellence.

Another means of success, to which the attention of the farmer must be particularly directed, is that of the saving of labor. Though he should be averse from withholding labor, wherever it can be profitably applied, yet it should be a great study with him how to apply it to the most advantage. His profession under the best circumstances will require much hard toil; and he cannot look to avail himself of those facilities and aids, which the mechanic and the manufacturer find in the invention of the most curious machinery, and the application of water and steam power to their various arts. Yet the farmer is not without advantage from the improvements of science and mechanical ingenuity. An immense gain has been effected in the great machine the plough; and in regard to the facility of holding, the ease of draught, and the manner of executing the work, the modern cast iron plough of the most improved construction, has an extraordinary advantage over the clumsy and cumbersome machine of former times. The revolving horse rake is a machine of great utility; by which on smooth land, a man and boy and horse will easily perform the work of six men. A threshing machine, whose operation has been completely tested, has lately been introduced here, which promises to be of great utility. It is worked by a single horse, and is without difficulty transported from place to place. It performs its work in a perfect manner, and has been known to thresh two bushels of grain in five minutes. Two men, a boy, and a horse, will easily thresh one hundred bushels in a day; and the actual saving of grain, from the more effectual manner in which it performs its work, over what can be done by a flail, is very great. A roller of an improved construction is exhibited on this occasion: and deserves the attention of farmers, as an instrument next in value to a harrow or a plough, and almost as indispensable to good cultivation. This is literally the age of invention. Improved machines for shelling corn, for cutting fodder, for grinding corn in the mill, &c. are fast coming into use, and promise great advantages. We may hope that other inventions may present themselves to ingenious and inquisitive minds, by which the severe toil of the husbandman may be lightened and abridged.*

Another great object of the farmer should be to restrict the expenses of his farming establishment; to cut off all unnecessary expenditures; and to apply his produce, as far as it is consumed on the

* A mowing machine moved by horse power, and producing a great saving of manual labor, has been for two or three years in successful operation in Pennsylvania, and the western parts of New York; and from the testimony of one of the largest farmers in the United States, upon whose farm it has been two years in use, is highly successful. We cannot imagine what human skill and enterprise may yet effect. Professor Rafinesque, of Philadelphia, a gentleman of distinguished scientific attainments, advertises for farmers, his "steam ploughs, by which six furrows are ploughed at once; and he promises in one day to perform the work of a week in the best manner." Of their construction or operation I have no idea.

farm, in the most frugal manner. The cooking of much of the food of his domestic animals increases its nutritive powers; and causes it to spend to much more advantage. The cutting of fodder for his horses and neat cattle, is of great utility, and effects a saving, as the most exact experiments have shown, of more than one quarter. The preference of ox labor over horse labor, deserves his particular attention. The keeping of a horse is a great expense separate from the accidents to which he is exposed; and in most respects the patient ox has greatly the advantage over him, especially as the former is an improving and the latter always a deteriorating capital.

The crops to which the farmer may to most advantage devote his cultivation will deserve his particular consideration. Indian corn, of which I have not a doubt the crops in this part of the country may be easily doubled, is a most valuable product. I congratulate the farmers upon the favorable prospects, which now present themselves, in regard to the cultivation of wheat. The two last years have presented extraordinary encouragement, and by proper management and especially by early sowing, success in this cultivation becomes highly probable.

The establishment of extensive manufactories, and the introduction of power-looms and spinning-jennies, has nearly destroyed the usual household manufactures, and put our other Jennies out of employment. Our ears are seldom greeted now-a-days in the farmer's cottage with the flying of the shuttle, or the deep base of the spinning wheel. We confess that we have looked upon their departure with a strong feeling of regret; and deem it no small abatement of the advantages, which the establishment of extensive manufactures has obviously yielded to the country, that it removes the daughter from the shelter and security of the paternal roof, and places her in a situation, which certainly furnishes no means of qualifying her for the proper department of woman; to preside over our domestic establishments; to perform her part in the joint labors of the household; and to know how and when and where to use, prepare, and to apply to the best advantage within doors, the products of man's labor without doors. Many occupations of female industry, strictly domestic however, of a healthy and agreeable nature, are constantly presenting themselves, so that there is little danger that the race of industrious women, and accomplished wives, at least among the country girls, will soon be extinct; and the silk culture, fast gaining ground among us, promises to furnish an unexhausted resource and a profitable employment of female labor.

IV. A variety of important topics press themselves on this occasion upon your attention; but I forbear, having already trespassed too far upon the candor of my respected audience.

Agriculture is a great subject. The first of all the arts, it may derive aid from them all. The foundation of human subsistence, comfort, and enjoyment, the origin of all wealth, and the basis of commerce and manufactures, it deserves the profound attention of enlightened and philanthropic minds.

That attention it has often and will continue to receive. Agriculture is greatly in debt to science. Ignorance and prejudice may deny the obligations; but all the great improvements, which have ever been made in agriculture, have been effected by the inquiries and experiments of men of enlightened and active minds, of wealth and public spirit.

Their experiments have been made often at a serious expense to themselves; but at a proportionate gain to others. They have often been wholly unsuccessful; but to an art so entirely practical as agriculture, it is as important to know what cannot, as to determine what can be done. There is no prejudice more contemptible and senseless than that which prevails against what is called book farming, and professes to disclaim all instruction which comes in a printed form. If by book farming be meant that a man undertakes to cultivate his farm by mere theory, without any experimental knowledge or observation, I only say that no such instances have come within my knowledge; but if it be meant only that an intelligent man avails himself of the history of agriculture of other men and other countries, as far as it is applicable to his own condition, and of all the aids which science or art, chemistry, botany, zoology, anatomy, entomology, natural history, natural philosophy, and mechanics can afford in relation to the subject; and of the actual and exact experiments of other men, faithfully made and fully detailed, I am not able to see how he could pursue a wiser course, for his own interest and success, the general improvement of the art, and the benefit of society.

It is to be hoped that the intellectual improvement of the agricultural classes, will keep pace with that of other classes in our favored community. In that impetuous struggle for advancement in knowledge, which is every where hurrying the working classes forward, may the farmers neither hold back, nor get out of the traces, nor lag behind. Their opportunities for improvement are great. Books are universally accessible. Small associations or circles for mutual improvement are highly useful as well as agreeable; and the long evenings of winter, instead of being worse than wasted in the senseless gossip and idle talk of the shop or tavern, afford most favorable opportunities for useful reading, for the instruction of our families, and the enjoyment of the innocent and delightful recreations of domestic life.

The respectable farmer occupies a most important and responsible moral station in the community. Coming in contact with a numerous class of young men, whose manners and morals have been too often coarse, vulgar, intemperate, and disreputable, it becomes his duty, and he should deem it a great privilege, to exhibit such an example of sobriety, decorum, civil manners, and blameless conversation, as can hardly fail to command their respect and to win their esteem. Profaneness, indecency, and intemperance, which have been but the too common vices of this class of men, he should resolutely expel from his territory; and above all things not countenance them by a disgraceful example. The farming interest is fast experiencing the most important benefits of the utter disuse of ardent spirit, the complete exorcism of this worst of evil spirits from their premises. Many a thrifty farm and many a beautiful cottage, the abode of industry, contentment, and competence, has been washed away by the bitter stream of New England rum; and it has gradually undermined the tenement, until, at last, the whole inmates have fallen in a common ruin, and have floated downwards on a current which never stops, into the dark ocean of infamy and unutterable wretchedness.

Agriculture can never be looked to in this part of the country, as a source of wealth. Yet it may be made to yield an ample competence; and suffi-

cient to satisfy the reasonable demands of a well disciplined mind, which has just views of human life, and is neither cankered by vice nor intoxicated by ambition. His gains, the fruits of honest industry, made at no man's expense, and prejudicing no man's interest, may be enjoyed with the full satisfaction of his own heart and conscience. His occupation presents no hazards to his own, or his children's virtue. He has at his command, all the means of subsistence and comfort. His abode is the calm abode of peace, industry, frugality and contentment. His table is spread with the substantial fruits of his own labor. His clothing is gathered from the flocks which he himself feeds; and woven by the industrious hands of the wife and children whom he loves, and who love to share his labor, he wears it with an honorable and enviable pride. When honor and integrity, kindness and piety, shed their combined influence over such a habitation, however lowly, humble, secluded, weather-beaten, or moss-covered, it presents an example of substantial independence and domestic comfort, which the proudest monarchs of the earth may envy.

The farmer, of all others, should be a man of religion. If pious gratitude and confidence, find no place in his bosom, his mind must be debased by selfishness, and his heart as hard as the stones of his fields. "Even the ox knoweth his owner, and the ass his master's crib." How can he then, receiving so immediately as he does from the hand of God, the exuberant bounties of his providence, be unmindful of the source of all his power, and all his blessings!

In the wonderful operations of nature constantly going on around him, he is compelled to remark the wise and ever active providence which sustains and directs all things. In the part which he is called to perform in these extraordinary and miraculous processes, he is most forcibly reminded of his own dependence. In the abundant fruits which crown his labors, and the ample and rich provision every where made for the support and enjoyment of all the animal creation, he cannot but adore the infinite goodness of the AUTHOR and mysterious PRESERVER of nature. In every department of the wide field in which God requires or permits him to toil or to partake, as the humble co-operator in the labors of the great HUSBANDMAN, or the favored recipient of his unrestricted bounty, he has constant occasion to regard Him as the great object of his reverence, confidence, and love; of his humble and devoted obedience, of his fervent and filial gratitude, and to bow down before Him, as "all in all."

MASS. AGRICULTURAL SOCIETY.

MR. CARTER'S CULTIVATION OF A PREMIUM CROP OF POTATOES.

To the Committee on Experiments and Agricultural Products:

GENTLEMEN:—In offering a statement of the cultivation and product of one acre of Potatoes for the premium offered by the Trustees of the Agricultural Society, I deem it proper in conformity to their rules to state that the sward was broken in Dec. 1832 (having the summer previous taken from the same about 1½ tons English Hay)—in the spring of 1833 cross ploughed—then carted on 40 buck loads or about 16 cords of rich animal

manure, spread and ploughed in the same, and about the first of June after the field had been sown 2½ feet apart the seed (consisting of 3ds long reds, 3d blues, 55 bushels) was planted—when the plants were all out of the ground the field received a first dressing—second ditto when the plants were 1 foot in height—The crop harvested 1st November, which was by correct measurement, 677 bushels on one acre.

WILLIAM CARTER.

Fitchburg, November 27, 1833.

I certify that I assisted in digging and measuring the whole crop of potatoes mentioned above, and that the amount was as there stated, six hundred and seventy-seven bushels.

JOHN STICKNEY.

Worcester, ss. November 27, 1833.

Then appeared the above named William Carter and John Stickney, and severally made oath that the above statements and certificates by them severally subscribed are true.

Before me,

EBENEZER TORREY, Just. Peace.

This is to certify that I, Philip F. Cowdin, being sworn Surveyor in the town of Fitchburg in the County of Worcester, having measured a piece of ground on which Potatoes grew this season, and find it to contain one acre and no more, the Land of Wm. Carter of Fitchburg, and cultivated by himself.

PHILIP F. COWDIN.

Fitchburg, November 20, 1833.

MR. CARTER'S CULTIVATION OF A PREMIUM CROP OF BARLEY.

To the Committee on Agricultural Products and Experiments of the Mass. Agr. Society:

GENTLEMEN:—In claiming the Premium offered by the Trustees of the Mass. Agr. Society, I take leave to state that the product of 57 bushels of barley was grown the past season on the same acre which had 691 bushels of Potatoes grown, and which obtained your premium in 1832—quantity of seed sown, 5 bushels—kind, the common 2 rowed—crop harvested last part of July.

WILLIAM CARTER.

Fitchburg, November 27, 1833.

I hereby certify that I assisted Mr. William Carter in harvesting, threshing and measuring the above named crop of Barley, and that the whole amount was as there stated, fifty-seven bushels.

JOHN SMITH.

Worcester ss. November 27, 1833.

Then the above named William Carter and John Smith, severally made oath that the above statements by them severally subscribed are true.

Before me,

EBENEZER TORREY, Just. of Peace.

This is to certify that I, Philip F. Cowdin, being sworn Surveyor in the town of Fitchburg, in Worcester County, having measured a piece of ground on which Barley grew this season, and find it to contain one acre and no more. The land is owned by William Carter of said Fitchburg, and cultivated by himself.

PHILIP F. COWDIN.

Fitchburg, November 20, 1833.

COMMUNICATIONS.

For the New England Farmer.

CURE FOR THE TOOTH-ACHE.

MR. FESSENDEN—Sir, We have often seen recipes in your paper for the tooth-ache, but have never seen the one that has often relieved us and some of our friends. We burn writing paper on pewter, which will produce oil; we absorb the same on cotton or lint and apply it to the hollow place in the tooth. It has a tendency to kill the marrow, of course does not ease it immediately, but let it remain fifteen or twenty minutes, and apply it afresh a second and even a third time if needful. We think the patient will be relieved, if not cured entirely. Care should be taken that the oil be not swallowed or come in contact with the other teeth.

BEST METHOD OF PRESERVING QUINCE.

PARE and quarter the quince, let the cores and parings be boiled in water until soft, then rub through a sieve; let the juice and quince be put in a jar and placed in a heated oven and remain until soft, or if you choose in some other vessel over a very slow fire that the quarter may not be broken. An equal weight of sugar to that of the quince should then be dissolved in a little water, and scum; then put it to the quince and scald for a short time, and perhaps in a week scald again. If molasses be used, perhaps half a pint to 1½ lb. of quince would be a suitable proportion for sauce. Done in this way the quince will not be hard, but may be cut with a tea-spoon.

Sir, if you think either of the above, or both, worthy an insertion in your paper, you will gratify A FEMALE FRIEND.

RICE MILL.

AMONG the inventions and improvements of the age, the patent Rice Mill is destined to take an important rank, whether it be considered as a labor saving machine, or as a means of giving increased value to an article of food. This Mill was invented and patented by a gentleman of Northampton. John Prince, Esq. of Roxbury, has recently erected one at South Boston, which is now in operation, and completely justifies the expectations of the proprietor. The process of hulling and cleansing Rice, as practised in the rice-growing regions, has always been expensive, troublesome, and imperfect. It is performed at Mr. Prince's Mill with great rapidity, and to a degree of perfection that will establish the value of the article beyond comparison, above that cleansed in the ordinary way. The machinery is moved by steam power. The grain is placed in the mill in its rough state, and passes through the various stages of the hulling and cleansing process, from hopper to hopper, without the intervention of manual labor of any sort, till it is delivered in its most perfect condition, fit for use. There is a separate mill for grinding the grain into flour.

We understand that the patentee has erected, or is about erecting, one of his mills at Wilmington, and another at Charleston. There is no doubt that it will speedily supersede the present mode of preparing rice for the market, which is by pounding.

When it is considered that rice furnishes not merely a cheap and wholesome food, but enters into the composition of many of the luxuries of the table as a principal ingredient, this improvement must be viewed as one of great importance, and the enterprising proprietor of the mill at S. Boston may claim consideration as a public benefactor.—B. Cow.

SUGAR FROM BEETS.

A WRITER in Goodsell's Farmer, who has been engaged in constructing machinery for the manufacture of this sugar in Europe, proposes to commence business at Rochester. He makes the following calculation :

| | |
|----------------------------|---------|
| Cost of producing an acre, | \$20 00 |
| Cost of manufacturing do., | 40 00 |
| | 60 00 |
| Amount of sugar produced, | 151 20 |
| Value of pulp remaining, | 6 00 |
| | 157 20 |
| Nett profit per acre, | \$97 20 |

RECIPES IN DOMESTIC AFFAIRS.

Baked Beefsteak Pudding.—Make a batter of milk, two eggs, and flour, or which is much better, of potatoes boiled and rubbed through a colander. Lay a little of the batter at the bottom of the dish, have the beef cut in thin slices and divided in pieces three inches long and well fried in butter, and seasoned to your taste; place them in the dish, and pour the remainder of the batter over them, and bake in an oven.

Pasties.—Shred rare done cold beef, with a little fat; season with pepper, salt, and if preferred a little onion. Make a plain paste of flour, roll it thin, and cut in shape of an apple puff; fill it with the shred beef, pinch the edges and fry brown. The paste should be made with a small quantity of butter, eggs and milk.

Beef Cakes.—Make fine some beef that is rare done, with a little fat bacon; season with pepper and salt, and otherwise as preferred; mix well and make into small cakes three inches long, and half as wide and thick, and fry them a light brown, and serve with gravy.—*Northern Farmer.*

Dressing Meats.—"Wash all meats before you dress; if for boiling, the color will be better for soaking; if for roasting, dry it. Boiling in a well flavored cloth, will improve much the appearance. The pot should be skimmed the moment it boils, otherwise the meat will have a foul appearance.

"The boiler and all utensils should be kept delicately clean; they will otherwise communicate a bad flavor to the meat.

"Meat should be boiled slow, or it will be hard; weigh the joint, and allow a quarter of an hour to each pound, and about twenty minutes over."

If you have a greater quantity of cheeses in the house than is likely to be soon used, cover them carefully with paper, fastened on with flour paste, so as to exclude the air. In this way they may be kept from insects for years. They should be kept in a dry cool place.

Woollens should be washed in very hot suds and hot rinsed. Luke-warm water shrinks them. Suet and lard keep better in tin than in earthen vessels.

Suet keeps good all the year round if chopped and packed down in a stone jar, covered with molasses.

See that the beef and pork are always under brine; and that the brine is sweet and clean.—*Gen. Farmer.*

AN OLD LADY.

THE Troy press, giving the account of the age of a Dutch lady in that city, who is now one hundred and two years of age, and who walked fourteen miles last summer in less than nine hours, says, "her chief diet through life has been sour-kraut, Dutch pop and brown bread. She chopped

and hacked her own fire-wood if the men were not at home."

From the Farmer's Register.
LUCERN.

My experience with Lucern has been very satisfactory. I have cultivated it six years, and consider it one of the most valuable grasses known: its yield is immense, and is preferred by stock to almost any other green, or in the form of hay. I cut it five times a year, and get as much from each cutting as if it were repeated, but twice or three times: for soiling therefore, it is invaluable. I usually sow it in drills three feet apart: this enables me to cultivate a cleansing crop between them, so that in working one I work the other, which is absolutely necessary, as without it the Lucern is soon overrun, and destroyed by the native grass. This appears almost a paradox in vegetable physiology, considering the great depth (5 or 10 feet) to which the tap root of the Lucern has been traced in pursuit of water. I this year raised a crop of mangel wurtzel between my rows, with as little inconvenience as I could have cultivated either separately.

The Lucern is a very hardy plant, and resists heat and cold better than any other grass with which I am acquainted. It grows luxuriantly at this place in the sand fertilized with stable manure, without the addition of a particle of clay or vegetable mould. It will also grow on a stiff soil, but a light loam is best adapted to it. In February 1832, the weather mild and open, I drilled a small lot of rather stiff, shelly land with Lucern; it came up beautifully in eight or ten days. Every body here recollects the extreme cold weather we had the March following:—I gave up my Lucern as lost; but I don't believe I lost a single plant. It continued green the whole time, and I cut three crops from it the first year.

I have made but one experiment in sowing Lucern broad cast: it did not succeed, and may have proceeded from the imperfect preparation of the land: but I rather think the drill system will be found to be the best in the end.

ROBERT ARCHER.

CLOVER HAY FOR STOCK.

FRIEND GOODSSELL—Believing that most of the subscribers to the Genesee Farmer keep milch cows, and also have their particular mode of feeding them, I wish to state a few facts, that have come under my observation. Most farmers that I have conversed with on the subject, give a preference to low land hay, with a considerable mixture of red top, for their stock, to clover and timothy. In the course of the past fall and present winter, I have fed my cow on the two different sorts of hay, with a peck of bran night and morning. While feeding the low land hay, which was cut in season, the quantity of milk per day was four quarts. Having occasion to get a further supply, I have fed my cow on this hay for eight days, giving her the same quantity of bran as before, and now get five quarts per day, of an improved quality and flavor.

AMOS DEAN.

Rochester, 2 mo. 12, 1832.

NOTE.—The above communication is well worth a careful perusal by every farmer. We have ever contended that timothy was altogether the best grass to cultivate for stock upon lands sufficiently dry to produce it. There will several inquiries spring from the above. Was it the clover which

caused the increase? or was it the timothy? or was it in consequence of both having been sated when put up? It is not difficult to combine all these together, if their several valuable qualities are increased.—*Ed. Genesee Farmer.*

From the Maine Farmer.

BURN'T TONGUE.

This disease which we mentioned in our last, and for which we gave recipes, has become very prevalent in this and some other sections of the State. It is undoubtedly an epidemic, as it attacks those which have not been near or exposed to those suffering with it. Hogs, horses, and cows, all have it.

At first it appears like a blister upon the tongue or in black patches upon the lips. The animals appear sluggish, drool and eat hay with difficulty; sometimes they refuse all nourishment, and seem averse to drinking. Water, whether cold or warm when drunk, brings on an ague fit, and they tremble, and shiver exceedingly. Some of the horses have been attacked in the feet. A swelling and eruption commences at the top of the hoof, accompanied with evident pain and soreness.

We have treated one case of this kind successfully by washing the feet with warm soap suds—then by a weak solution of chloride of lime, and a bandage soaked in pigs' foot oil. A very weak solution of oil of vitriol, used as a wash, has been successful in those cases where it has been tried. Physic of some nature should be freely used.

From the Genesee Farmer.

SIMPLE REMEDY FOR A CATARRH OR COLD.

I HAVE at various times within the last seven years been suddenly relieved from catarrh in its incipient stages, by drinking early in the morning, or at bed-time, a pint or more of cold water. During periods of three or four days, the symptoms,—such as increased sensibility to cold, lassitude, and defluxions from the nose,—have in various instances recurred in the mornings and evenings, but on taking the draught I have generally found myself better; and sometimes two or three draughts have been sufficient to effect a cure. Four days ago, a catarrh commenced; only simple cold water was employed as a remedy; I went out in the wind as usual; and last evening, finding myself free from disease, I discontinued the medicine.

To drink a large cup of cold water, when we are not prompted by thirst, is not very pleasant; but like other physic, it may be readily taken. I have found it invariably to increase the perspiration. With regard to its use in the latter stages of catarrh, I have no testimony to offer. VERITAS.

CHILBLAINS.

THESE troublesome attendants of the winter season sometimes assume the appearance of a dangerous and painful disease, especially when the skin breaks, and ulceration ensues, a state in which it is not easily curable. The Medical Journal however remarks, that "a very large proportion of the cases of chilblain attract sufficient notice at an earlier period of their progress, and when the skin is yet unbroken. All these cases require is a covering of gold beaters' skin, and a loose shoe. After soaking the feet in warm water, let the heels or other parts affected be well covered with the article, and in a few days the irritation will subside, in a vast proportion of cases, if not all. Simple as the remedy is, it will be found more effectual than all the plasters and washes of the pharmacopoeia."

From the *Genesee Farmer*.

GAMA GRASS.

PLANTERS in the southern states for several years past have been turning their attention to the culture of a native grass which promises great advantage. It is said to have been "first found in the south-west [from Mobile] and principally through the provinces of South America, where it is called by the Spaniards the *Gama Grass*." Dr. Hardeman of Missouri appears to have been the first cultivator of this plant in the United States; but whether he found the seed there, or procured it from the Spaniards, I have no evidence to show. It is certain however, that it is a native of various parts of the Union. Along the sea coast it has been found as far north as Connecticut; and in the interior on the Schuylkill 25 miles above Philadelphia, where I presume I have also seen it growing.

This grass has been long known to botanists under the name of *Tripsacum dactyloides* and *Tripsacum monostachyon*, which are found however, to be only varieties of the same species; but the knowledge that it was worthy of cultivation appears to have been derived from the Spanish Americans. One writer in North Carolina says, "I have had it in view as worthy the farmer's notice, these twenty years;" and another observes, that "unless lands are enclosed, the grazing tribe will not permit it to rise into notice."

From the following remarks of H. B. Croom, a distinguished botanist of Newbern, N. C. we may understand something of the situation of our brethren of the South—"while the northern and western portions of our country are provided with a variety of valuable grasses, suited to their climate and soils, the alluvial (?) portions of the southern states are entirely destitute of these useful auxiliaries; for I believe that neither clover, timothy, herd's grass, orchard grass, nor any of those grasses derived from northern climates, have proved, nor ever will prove extensively beneficial. The consequence is that throughout this extensive portion of country no hay is made; and the only native produce relied on as provender for horses and other cattle, is, the dried blades of Indian corn. Hence the planter's [live] stock is generally stunted during the winter, and the products of his dairy rendered extremely meagre: butter, cheese, and even hay, are exported from the north."

A grass that will more than place them on an equality with us, must therefore be of immense importance. The same writer continues: "The zealous advocates of this grass have assured us that it will yield from seventy to ninety tons of green hay, or from twenty to thirty tons of cured hay to the acre. But if there should be any exaggeration in this, we may reduce the estimate one half, and the produce will still remain ample enough to make its cultivation highly profitable. Ten tons of cured hay is equivalent to twenty-five ordinary stacks of our fodder, and thus the product of five acres of Gama grass, would equal one hundred and twenty-five stacks of corn fodder, which is more than is obtained from three hundred acres of corn on common soils."

J. Herhemont of Columbia in South Carolina, well known as a valuable and scientific correspondent of the *American Farmer*, says, "The hay, I have no doubt will be found excellent. As to the amount of produce, it is most probable that in the account which I have seen, stating that it would be about three hundred thousand pounds of grass to the acre, the person who made it was

rather too sanguine; but there can be no doubt of its being the most productive and easy cultivated grass ever tried in this country."

Wm. B. Meares of Sampson county in North Carolina, says, "Mr. Magoffin informs us he has actually made at the rate of ninety tons of green hay per acre in one year—equal to between twenty and thirty tons of cured hay. Dr. Hardeman states that a single root, covering a circle, the diameter of which was two feet, yielded at one cutting fifty-two pounds of green hay, which when dried weighed twenty pounds; and consequently that an acre of ground filled with roots equally productive, would yield more than two hundred and seventy tons of hay. However exorbitant these accounts may appear at first, the high standing of these gentlemen leaves no room to doubt their accuracy. My own experiments induced me to believe that under circumstances in all regards favorable, they may be realized."

The following extracts are descriptive of the habits of this grass:—"They came up in a few days," says J. Magoffin, "and appeared in the form of young oats." He transplanted them, and adds: "The rapidity of their growth astonished me, and I found by September each plant a bunch of fine blades—three and a half or four feet high"—it was "a mass of blades rising from the roots, almost perpendicular, exhibiting a most beautiful appearance of vegetable luxuriance."—"The leaves previous to flowering all issue from the same root, are of a deep green color, from two to three feet long, and from one to an inch and a half wide, shaped like a blade of fodder."—"The fodder stems shoot up from different parts of the bunch, and grow from three to seven feet high."—"When the seed is ripening on the end of the seed stalk, six to eight feet high, the mass of leaves appear to undergo no change" [but continue green.]

To show the rapidity of its growth, I make the extracts that follow: A leaf, the growth of twelve days, was sent to the Editor of the *American Farmer*, who says, "The blade of Gama grass enclosed in the letter measures thirty-two and a half inches in length." J. Magoffin remarks, "When all surrounding vegetation was literally burnt up [this grass] was green and flourishing; and during the month of July it grew forty-three inches."—"It was cut on the first day of every month, ranging from three and a half to four and a half feet in height." It grows well in both sandy and clayed soils.

In regard to its nutritious qualities the following testimony is selected: "Its taste resembles young corn blades—a taste of all others the most agreeable to animals. I found every thing was prodigiously fond of it, especially horses and cattle. A distinguished farmer and iron-master, found on trial that his mules performed their work with plenty of this grass and salt, rendering the addition of corn unnecessary."—"When made into hay, it becomes of a singular agreeable flavor."—"I have fairly tested its value in milk and butter. I cut at fifteen days growth, when it exhibits peculiar delicacy, and fed two cows, and perfectly in recollection of the fine butter of the Philadelphia Jersey market, I am assured it exceeds for delicacy the production of clover pastures, and is fully equal in that richness peculiar to the fine butter of that market-house. This I had been informed would be the case, by a Spanish gentleman, a native of those provinces of South America in which it abounds, and where it is so highly valued for its

extraordinary nutritive properties in the support of the horse, mule and ox."

To the kindness of Thomas S. Pleasants, of Beaverdam in Virginia, I am indebted for a small packet of seed, and I hope to be able to give it a fair trial in this northern climate. "It is probable," says H. B. Croom, "that this is one of the few valuable grasses that adapt themselves to every climate and every soil."

D. T.
Greatfield, Cayuga Co. 12 mo. 21, 1833.

From the *New York Farmer*.

CULTIVATION OF PEACH TREES.

PEACH trees may be preserved by good management, twenty, and probably forty or fifty years. They are destroyed from north latitude forty to thirty-six degrees, by a worm which feeds on the inner bark of the tree, at its root. This worm is said to be the offspring of a fly of the wasp kind, which deposits its eggs in the bark of the root of the tree, while it is young and tender. The remedy consists in searching for the openings in the bark at the root, and taking them out. If this operation is repeated three or four springs, the worms never after can make a lodgment there. The bark of the tree by this time becomes so hard, that the fly cannot make the puncture, in order to deposit the egg, or if deposited it perishes. After the worm is cut out in the spring, draw the earth up around the body six or eight inches above the other ground.

Of all the fruit trees produced in this climate, none bears pruning so freely as the peach; indeed, it should be treated very much as the vine is. All those branches which have borne fruit should be cut out, if there is young wood to supply their places. Proof—take a limb which has borne two or three crops of fruit, and notice its produce; take another on the same tree, which has never borne at all, and the fruit on this last will be twice the size of the former, fairer, and less liable to rot. In pruning, the branches should be taken or cut out of the middle of the tree: thus giving more air and sun to the fruit on the outer limbs.

The peach tree produces best fruit when the ground is not stirred about it when the fruit is on. When it has no fruit, it should be cultivated as carefully as a cabbage, or any other plant.

The above comprises the most important points in the rearing of peach trees, and good fruit; if attended to, I have never known them to fail,—and my experience has not been very limited.

I repeat what may, perhaps, be doubted; that the peach tree, if the worm is kept out of the root, will live, at least, twenty years; and that this may certainly be done by attacking them the first year of its growth, and continuing to extract them for three or four years in succession, not forgetting to draw the earth up as directed. Straw, chips, or trash of any kind, serve the purpose just as well.

Very respectfully, yours, &c. R. H. B.
Washington City, Nov. 26, 1833.

BLACK TONGUE.

A person who has had much experience in the care of horses informs us that he has found Sweet Oil (Oil of Olives) an infallible remedy for this loathsome and dangerous disorder.—He raises the horse's mouth by the bit, and then turns the oil from a bottle into the mouth till he swallows. In this way he administers it twice or three times a day.—*Worcester Spy*.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, FEB. 12, 1834.

EXPERIMENTAL AGRICULTURE.

Brighton, January 27th, 1834.

THOMAS G. FESSENDEN, Esq.—*Dear Sir,* You will doubtless recollect that in May last you gave me fifteen Foxite potatoes to plant, observing they were sent you as a superior kind of the early potatoes, and you had only left at your office those you gave me, which you thought rather smaller than the average of those sent you. I planted them on the 23d of May in good loamy soil, making ten hills; into each hill I had a shovelfull of good but coarse barn yard manure, well mixed with the earth at bottom of hills, and after dividing the potatoes, cutting them as nearly in halves as could be done and not touch the eyes; the ten hills were planted with three halves in each hill, and hoed through the season so as to keep the ground light and free from weeds. On the 18th of October (the tops having been dead for a month or more) they were dug, and produced three hundred and four potatoes, measuring one peck and a half good measure. They were nearly of an equal size, but I thought rather smaller than the seed you gave me. I have preserved them all for planting another season. I was disappointed in not having a greater yield; but with me the last season potatoes were generally of a good quality, but the quantity less than usual, owing probably to the long spell of dry weather after the tubers began to form.

On the 19th April last, John Prince, Esq. sent me six quarts of spring wheat, which he received from a friend in Halifax as a superior kind of spring wheat—and wished me to make trial of it. I prepared a small piece of ground which I thought favorable for wheat, being a light but naturally rich and deep loam; it was lightly manured, not more than at the rate of eight loads to the acre, of manure from the barn cellar; the ground ploughed and harrowed so as to be mellow and fine, then sowed the wheat in rows, struck out by a light plough fifteen inches apart. It came up well, and soon spread so much that it could not be hoed but once, after running a very small plough through the centre of the rows; the plough had double mould boards. The wheat soon covered the ground, and was sown too thick as appeared very evident; it was also sowed too late, and was on that account more affected by the dry spell which came on when the heads began to form, and continued till it was fit to reap, and I think the ripening was accelerated by the dry weather; it was reaped July 26th, threshed and cleaned the 2d of August, and measured one bushel and thirty quarts. It was so dry when reaped, and threshed, that I think had it been reaped one week sooner it would have produced full two bushels; the kernel was larger and whiter than that of the Gilman spring wheat which I raised the same season. I have kept the wheat for seed.

On the 26th June last, I received from Thomas Nuttall, Esq. Curator of the Botanic Garden, who had a day or two previous returned from England, two potatoes, accompanied by a note in which he says, that they are called the Black Apple Potato, which are in high estimation in Ireland, keeping perfectly well and retaining their flavor and mealiness till after the potatoes planted the season after (they the Black apple), had come to maturity, and

dug. Mr. Nuttall received a very few of the potatoes from a gentleman passenger in the ship with him, who procured them in Ireland to cultivate on his farm in one of the middle States. A trial was made of a few on board the ship a few days before she arrived in Boston, and they were pronounced superior to those used on the passage on board the ship, although they had been thought of an excellent quality. I have a man who has lived with me several years, a son of Erin and quite an observing and intelligent man, who on being shown the two potatoes without any intimation whence they came from, or any one particular in relation to them, expressed much pleasure that I had got some Black Apples, and of himself gave them all the good qualities Mr. Nuttall had mentioned in his note, observed he was well acquainted with them, and no one who loved potatoes and cultivated vegetables should be without them, as it would enable him to have the best of potatoes the year round. I planted the two potatoes the day I received them, June 26th, cut the eyes from them, making thirteen in number, and placed them in three hills, four in each of two hills and five in the third. The two potatoes weighed half a pound. I thought them very heavy for the size, and appeared hard and firm, as much so as potatoes when dug in the fall, no appearance of sprouting. A shovelfull of coarse manure was put in each hill, the soil favorable for potatoes, except that it had been too long under cultivation being a vacant place in my nursery from which trees had been removed in the spring preceding.—I have thought that grass land newly turned up, was far better for potatoes, corn and many other vegetables, not only tending to increase the quantity, but giving a different and better flavor to potatoes, melons, turnips, &c. The weather had become very dry at the time of planting the two potatoes, and I had occasion to use the water-pot very often after stirring the earth, which was done every week. The vines grew luxuriantly and continued growing till cut down by a hard frost. On the 18th of October the potatoes were dug, and from the three hills, obtained 30 small potatoes that did not appear to be half grown; they weighed four pounds one oz. and I have put them by carefully in a cool cellar, to plant next season.

I had intended to have given you the produce of a small field of corn in 1832 and 1833, which was thought very fine by many farmers who examined the fields, and I thought myself when growing, and when ripe it appeared equal certainly, if not superior to any I had met with in both seasons in this vicinity, or in an easterly direction for forty miles. The ground was carefully measured, the corn gathered and measured as I thought accurately, but the result was so short of the quantity raised far and near that I felt afraid to mention it to you, and must think I have deceived myself and have not the art of raising corn in the best manner, forming my opinion from the enormous crops which yearly are stated in the newspapers that give information on Agricultural subjects. I allude particularly to field corn, not small patches in gardens and on favorite spots to which unceasing labor is bestowed, an amount of labor if applied by a farmer to his corn field at the rate of labor for years past would indeed require a great crop to pay the expenses of cultivation, and have enough left to encourage him to go on. I cannot but suppose that such crops are raised as meet the public eye; but I wish you who

have always been friendly to me, to inform me what besides good deep and frequent ploughing, manuring in the hole with a large shovelfull of good manure, or dividing the quantity of manure, spreading and ploughing in one half, weeding early, ashing the corn at the two first weedings, and half hilling and hilling at the two last hoeings, first selecting the best of seed corn, and the kernels five in number placed carefully forming a square each kernel four inches apart and one in the centre—you will oblige me by saying what further is required to obtain one hundred bushels to the acre.

I beg of you to be particular in giving me the information requested, and am with sentiments of regard, yours respectfully,

GORHAM PARSONS.

BY THE EDITOR. We are happy to perceive that our respectable correspondent is disposed to promote the cause of husbandry by that great source of improvement, *experiment*. An able writer on agriculture says, "If improvements be wished for, experiments should be carefully recorded. If this be neglected, husbandry must be expected to remain in its present low state. For want of such records, a good deal of useful knowledge has been already lost. Though many have made experiments, by which they have satisfied themselves, but few have recorded them. The experimenters themselves have forgotten them, to such a degree, that they are apt to misrepresent them, when they attempt to relate them. And too many suffer useful discoveries to die with them."*

We aspire to nothing more than the privilege of printing and publishing records of experiments made by experienced and scientific cultivators, like our friend to whom we are indebted for the above communication; but if we can in any degree promote the great cause of agricultural improvement by hints derived either from reading or observation, we shall contribute our mite with alacrity.

The "Foxite potatoes" mentioned by Mr. Parsons, were received from Mr. Benjamin Cooper, of Camden, New Jersey, and were part of a barrel which that gentleman was so good as to send as a present, and were distributed in small parcels among such cultivators as were inclined to propagate them. They were originally from England. Mr. Cooper stated, in substance, that about twenty years since he obtained a few, and planted them, and has continued to do so from that period to the present time without a change of seed, and they are still as good and productive as they were at first. "But I am always careful not to make use of the best for cooking or sale and plant the refuse. When this is done, I do not marvel at the common complaint of seeds degenerating. It is a good practice, and should be done every few years, to be careful when the crop is gathering, when a large number of good sized fair potatoes are attached to a stalk to put them by, and plant them for seed."†

With regard to the Black Apple Potato, we can only say that we feel much interest in the success of an experiment, which bids fair to be instrumental in giving us a new and valuable variety of that excellent root. We cannot find, in any of our books, any notices of a variety of the potato with that name. Loudon, however, mentions the "Black skin, mealy, white and good;" and the "Red apple,

* Deane's New England Farmer.
† See N. E. Farmer, vol. xi. p. 83.

neely, keeps the longest of any." This last, perhaps may be identical with the Black apple of Mr. Nutall, and the former a near relation. But we find it necessary to postpone to our next some further remarks on subjects suggested by Mr. Parsons' experiments.

ITEMS OF INTELLIGENCE.

A short Passage.—The packet ship Napoleon, Capt. Smith, sailed from New York on the 8th of November, and arrived at Liverpool on the 25th of November, after a run of only sixteen days from dock to dock.—*Balt. pa.*

Mammoth Hog.—A hog, weighing about 1300 pounds, 9 feet long, 7 feet 3 inches in circumference, is advertised to be shot for in York County, Penn.

Large Calf.—A full blooded bull calf of the Durham breed, raised by Samuel Look, in this city, short of 11 months old, weighed, a few days since, 775 lbs. by the scales. This is believed to be the largest and best calf ever raised in this section of the State. Who can produce an equal?—*Lancaster Penn.*

Weather. In December, we were scarcely reminded by the temperature of the atmosphere, that we were in the midst of winter. Jan. 1st, snow fell sufficient to cover the ground, and the weather suddenly became intensely cold, and so continued for several days. On the 5th, the thermometer stood at 18 below zero, at sunrise. The oldest settlers say they never knew it so cold in Illinois. We have already verged again into open spring; the sun is as pleasant as in May, and water is running in the streets.—*Ill. Intel.*

Colder Still. At Jacksonville, Illinois, according to the Patriot, the cold on the 4th of Jan. was so intense, that the thermometer stood at 26, and on the 5th at 28 degrees below zero.

In the Niagara Courier a notice is given of an intended "general wolf hunt." The arrangements seem to be conducted with true military precision—marshals are appointed, and the line to be pursued by each company, distinctly marked out.

GRASS SEEDS.

20 CASKS of Superior NORTHERN CLOVER; 200 Bushels TIMOTHY or HERDS GRASS, for Sale, Wholesale and Retail. Now is an excellent opportunity for Merchants and Traders to obtain their spring supply—being low, will be sold for Cash only.

GEO. C. BARRETT, New-England Seed Store,
North Market Street, Boston.

BIRD SEEDS.

Just received a fresh supply of Canary, Hemp, Millet, Maw and Rape Seeds.

GARDEN SEEDS.

200 BOXES of Assorted GARDEN SEEDS for Traders, papered up in small papers at 6 cts. each, for retailing, and warranted of best quality and vitality.

For Sale at the Seed Store,
Nos. 51 & 53 North Market Street.

QUARTERLY REVIEW, NO. XCIX.

For October 1833—Containing The Bridgewater Treatises; Madden on the Infirmitates of Genius; Cunningham's Lives of the Painters; Life and Posthumous Works of Archdeacon Cox; Surveys of Africa, Arabia, and Madagascar; Great Britain in 1833; Grimm on the Indo-European Languages; The Duchess of Berri in La Vendee; Bergami et la d'Anglisterre; The Reform Ministry and Parliament. Just published by LILLY, WAIT & CO. Feb. 12.

BULL FOR SALE.

A first rate Durham Short Horned Bull, bred by the late Thomas Williams, of Noddle's Island—three years old. Got by Cicero, dam an imported Cow. Cicero by Col. Jaques's imported Bull Colebs. Enquire of G. C. BARRETT, at this office. Feb. 12.

NOTICE.

A young man, 25 years of age, bred a farmer, and is capable of overseeing and laboring on a Farm, wishes for employment in the above business. Letters post paid, and addressed to Moses Field, Northfield, Mass., will be attended to. Testimonials of good moral character and ability, can be given if necessary. Jan. 29.

BRIGHTON CATTLE FAIR HOTEL.

THE subscriber has taken a lease of the Brighton Cattle Fair Hotel, and has conditioned in his lease from the Directors approved at a meeting of the corporation, to use his best exertions to keep an orderly, well provided, and well attended House of Entertainment for Public Accommodation. He feels no disposition to interfere with the rights of any men or body of men associated for the purpose of drawing custom from this establishment, built, as he is informed, for the purpose of accommodating the public, particularly the Drovers and Dealers at this market, who have frequented it for many years past. But he will pledge himself to the former customers, to the present customers, and to all who may hereafter favor him with their patronage, to endeavor, so far as in his power, to deserve it, by constant and unremitted attention on his part, the only means he has to obtain and secure it.—Those persons throughout the Commonwealth, and in the neighboring and other States in the Union, and all whose business leads them to Brighton, are requested to make favorable notice of this advertisement, and oblige their obedient servant,
Z. B. PORTER.

IF Gentlemen and parties from the city will also find good accommodations, and every thing usually found in an establishment of this kind.

Brighton Cattle Fair Hotel, Feb. 5, 1834. if

BLACK SEA SPRING WHEAT.

For Sale at the Seed Store of Mr. Geo. C. Barrett, North Market Street, Boston. As this variety of Wheat produced the past season 55 bushels to the acre on the Farm of the subscriber and its flour being of a very superior quality, he deems any other recommendation unnecessary.

PAYSON WILLIAMS.

Fitchburg, Jan. 22, 1834.

WANTED.

A faithful young man (unmarried) who can come well recommended, to take the work of the Farm and Garden of a small family. Apply at this office.

SITUATION WANTED BY A GARDENER.

A young man, who is perfectly conversant with each department of his business, and can produce satisfactory recommendations. Any commands addressed to A. B. and left at the office of this paper will be promptly attended to.
Jan. 29. if

TO BE LET

THE whole, or part of a Farm, in the vicinity of Boston, containing about 95 acres of good land, with a convenient House, Barn, and out houses—of which possession may be had on the 1st of April next—Provided application is made by a capable, steady and industrious man, of good moral character, and who has been educated in the business of Farming, and who will produce a good recommendation of such qualifications—and none other need apply.

For further information, enquire of the proprietor and publisher of the New-England Farmer, at his Office, Nos. 51 & 52, North Market Street, Boston.

COTTON GOODS

AT REDUCED PRICES.

ELIAB STONE BREWER, 414 Washington st. (South End.) offers for sale, the largest assortment of COTTON GOODS, to be found in any retail store in the city, at very reduced prices, viz.

BRIGHTON MARKET.—MONDAY, FEB. 10, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 502 Beef Cattle, divided as follows: At Brighton, 193 Beef Cattle; at Cambridge, 309 Beef Cattle, and 624 Sheep. About 100 Beef Cattle unsold.

PRICES. Beef Cattle.—Sales dull, and prices reduced; and many 'Irish speculations' were made; Cattle generally were actually sold to the butcher for less than they cost at the feeders' stall. We noticed a yoke or two extraordinary fine taken at \$6. We quote prime at 5 25 a 5 75; good at 4 75 a 5; thin at 4 a 4 50.

Sheep.—We noticed only two lots sold at 4 75 a 5. About 300 were not sold at sundown when we left the market.

Swine.—None at market.

NOTICE.

THE Trustees of the Society of Middlesex Husbandmen and Manufacturers, will hold their Annual Meeting at *Shepherd's Hotel*, in Concord, on Tuesday, 25th inst. at 10 o'clock, A. M. A punctual attendance is desirable.

All persons having claims for premiums, or agricultural experiments, will present the same at this meeting accompanied by vouchers.

J. STACY, Secretary.

MISCELLANY.

MECHANICS' SONG.

The following Song has been attributed to Dr. Franklin. It is said he wrote it for the Procession of Trades in Philadelphia, at the adoption of the Constitution, on which occasion a press was drawn along the streets, and copies of it distributed to the multitude.

Ye merry Mechanics! come join in my song,
And let the brisk chorus go bounding along,
Though some may be poor, and some rich there may be,
Yet all are contented, and happy and free.

Ye Tailors! of ancient and noble renown,
Who clothe all the people in country or town,
Remember that Adam, your father and head,
The Lord of the world, was a tailor by trade.

Ye Masons! who work in stone, mortar and brick,
And lay the foundation, deep, solid and thick,
Though hard be your labor, yet lasting your fame,
Both Egypt and China your wonders proclaim.

Ye Smiths! who forge tools for all trades here below,
You have nothing to fear while you smite and you blow,
All things you may conquer, so happy your lot,
If you're careful to strike while your Iron is hot.

Ye Shoemakers! noble from ages long past,
Have defended your rights with your all to the last!
And Cobblers, all merry, not only stop holes,
But work night and day for the good of our soles.

Ye Cabinet Makers! brave workers in wood,
As you work for the ladies your work must be good;
And Joiners and Carpenters, far off and near,
Stick close to your trades, and you've nothing to fear.

Ye Hatters! who oft with hands not very fair,
Fix hats on a block for a blockhead to wear;
Though charity covers a sin now and then,
You cover the heads and the sins of all men.

Ye Coach Makers, must not by tax be controlled,
But ship off your coaches and fetch us home gold;
The roll of your coach made Copernicus reel,
And fancy the world to turn round like a wheel.

And Carders, and Spinners, and Weavers attend,
And take the advice of Poor Richard your friend;
Stick close to your looms, your wheels, and your card,
And you never need fear of the times being hard.

Ye Printers! who give us our learning and news,
And impartially print for Turks, Christians and Jews,
Let your favorite toasts ever bound in the streets,
The freedom of speech and a volume in sheets!

Ye Coopers! who rattle with drivers and adze,
A lecture each day upon hoops and on heads,
The famous old ballad of *Love in a Tub*,
You may sing to the tune of your rub a dub.

Ye Ship Builders! Riggers! and Makers of Sails!
Already the new constitution prevails;
And soon you shall see o'er the proud swelling tide,
The ships of Columbia triumphantly ride.

Each Tradesman turn out with his tools in his hand,
To cherish the arts and keep peace through the land;
Each 'Prentice and Journeyman join in my song,
And let the brisk chorus go bounding along.

ROMAN MORALS.

In the business, for example, of getting in his corn, it is our duty rather to assist a next neighbor than either a brother or familiar friend; but if the business be a case at law, then a kinsman or friend must rather be defended than a next neighbor.

Among all the methods of enriching one's self, there is no one better, no one more profitable, and pleasant, and agreeable, no one more worthy of a man and a gentleman, than that of manuring and tilling the ground.

The senior Cato being once asked what he thought most profitable in the management of an estate? said, 'To feed cattle well.' And what the second? 'To feed cattle pretty well.' And what the third? 'To feed cattle, though but ill.'—Cicero.

From the Genesee Farmer.

HOG TROUGHS.

This is indeed a humble caption, Mr. Editor, and may cause the fastidious to throw down your paper in disgust; and the more humble farmer who reads to improve his knowledge of agriculture will say,—"Who does not know how to build a hog trough?" True—any one can make a thing which a hog may condescend to eat out of; but it is owing in a great measure to his good manners, that he does not oftener turn up his nose in disgust at the very unseemly dish in which his repast is served up. A dug out trough, with one end poking through the door-yard fence and the remainder in the street, is the common receptacle of the good things which a farmer has to bestow upon his swine. I know of some of my neighbors who have used a trough even more humble than this, made by the swine themselves, and not liable to two very serious objections to the dug out one—viz: it is not easily overturned, and never rots. As timber is growing scarce, and the skill of making bass wood sap troughs becoming obsolete, I would suggest a method of making this necessary appendage of a farm yard, more in unison with the cultivated habits of the present age. Take two pieces of plank, a foot or two in length, eight or ten inches wide; saw out of each a triangular piece in this form —nail in this angle boards of the required length and width, taking the pieces sawed out of the plank for the end pieces. Nail it well, and you have a trough not liable to be overturned, never will leak, and not exposed to rot. The better way is to apply an iron square and mark the angle accurately, that both ends be alike, and to have the lower edge of the boards jointed. I think a farmer's own sagacity will indicate how near the ends to have the plank, and the whole process of making a trough on the proposed plan. Care ought, however, to be taken in sawing out these angular pieces accurately so that they will fit well to the ends of the trough.

Yours, &c. O. P. Q.

East Bloomfield, Jan. 15, 1834.

ANIMAL FRIENDSHIP.

In the war in Spain, some years ago, two horses had long served together in the same brigade of artillery. They had assisted in drawing the same gun, and had been inseparable companions in many battles. One of them was at last killed; and after the engagement the survivor was piqueted as usual, and his food brought to him. He refused, however, to eat, and was constantly turning round his head to look for his companion, sometimes neighing as if to call him. All the care that was bestowed upon him was of no avail. He was surrounded by other horses, but he did not notice them; he shortly afterwards died, not having once tasted food from the time his associate was killed.

LONGEVITY.

The oldest person deceased in the U. States, was a negress in Pennsylvania, aged 150 years. The oldest Englishman known, was Jenkins, who died at the age of 169.

NEW WORK.

LILLY, WAIT & CO. and GEO. C. BARRETT,
191 Washington street. 51 & 53 N. Market st.

Will Publish this Month the First Volume of

THE COMPLETE FARMER AND RURAL ECONOMIST.

Forming a Compendium of the most important Branches of Agriculture and Rural Economy.

BY THOMAS G. FESSENDEN, ESQ.
Editor of the New England Farmer.

THE Editor and Publishers have been induced to offer this work to the Public in consequence of the great and increasing demand for information on the subjects which it is intended to embrace, with a hope that it may prove useful to the Agricultural and Horticultural community, in whose pursuits all mankind have a direct and obvious interest. It is intended to form a Compendious Directory to the Farmer, Gardener, Florist, and Rural Economist, and to be so arranged that every article may be readily referred to.

VOLUME I.

The First Volume will be devoted to AGRICULTURE, in its various branches, embracing the following among other topics:

| | | |
|--------------|--------------|-------------------|
| Soils, | Manures, | Dairy, |
| Grasses, | Hemp, | Sheep, |
| Grains, | Flax, | Swine, |
| Indian Corn, | Neat Cattle, | Poultry, |
| Wheat, | Horse, | Woodland, &c. &c. |
| Fences. | | |

VOLUME II.

The Second Volume will be devoted to HORTICULTURE, in its various branches; also, SILK, BEES, RURAL ECONOMY, &c. In this volume, the following will be among the number of topics embraced in the treatise:

| | | |
|-----------|-----------|----------------|
| Garden, | Hot Beds, | Insects, |
| Orchards, | Mulberry, | Rural Economy, |
| Fruits, | Silk, | &c. &c. |
| Vine, | | |

To each volume will be added a list of the best Implements in use, and drawings of the most important and improved kinds will be given.

CONDITIONS.

The work will be comprised in two volumes, royal 12mo. of 350 pages—price \$1 a volume;—and either volume may be had separately, as they will be entirely independent of each other.

To persons at a distance remitting \$5 by mail, post paid, to either of the undersigned, shall be delivered at any post office in the United States 5 copies of either volume free of postage, sewed and done up in strong cloth backs and in good order.

For \$1, remitted free of postage, shall be sent one copy of either volume, postage unpaid.

☞ SUBSCRIPTIONS RECEIVED AS ABOVE ☞

THE NEW ENGLAND FARMER.

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

☞ No paper will be sent to a distance without payment being made in advance.

AGENTS.

COMMUNICATIONS.

For the New England Farmer.

CUTTING HAY FOR CATTLE.

MR. FESSENDEN, I read the minute statement and details of any agricultural process or experiment, in which exactness is attainable, always with particular interest, believing that in agriculture, experiment is the great means of improvement.

With these feelings I examined with much attention the communication of Mr. Amos Sheldon on the subject of cutting hay for cattle, a gentleman whose intelligence and excellent management as a farmer is well known to me; and whose arrangements for saving manure and conducting his milk establishment, I have examined with very great satisfaction. His establishment, and that on the neighboring Burley farm belonging to Frederick Howes, Esq. of Salem, are superior models of neatness and convenience.

I have no doubt, from the experience of many years, of the great economy of cutting feed for stock, horses in a particular manner; and from a partial examination of Mr. Willis' improved Straw Cutter, I am inclined to think highly of it. But I regret that in so important a statement any thing should be matter of "guessing" when, with little trouble, certainty was attainable.

The amount of Hay consumed was according to his account conjectural, and yet he ventures to state it with exactness. This is the material point where accuracy was particularly important. In the first case likewise, he gave 8 bushels of long red potatoes—in the second, when the milk was so much increased, he gave only 4 bushels chopped. Does he mean it should be inferred from this that "chopping" the potatoes doubled the

value? The cost of labor likewise, 3 dollars per month, from the amount carried out is intended I presume for 8 dollars. Does this mean that the cutting of the feed occupied the whole time of one man? He mentions likewise 140 gallons pure water. Was the fodder given in a wet or a dry state; and was the meal sprinkled upon it or given by itself? These are matters which we should have been glad to have had stated.

The increase of milk, especially when the amount of feed both dry and succulent was so greatly reduced, is quite a remarkable fact; and as Mr. Sheldon designed evidently to refer it to the use of cut-feed, we should be glad to have the opinions of this intelligent farmer on the whole subject. That the use of cut-feed for animals is matter of great economy is established, but the effect here mentioned is extraordinary and new to me. The philosophy of digestion and nutrition is a subject very imperfectly understood; indeed the solution of the mystery can scarcely be said to be approached. That by cutting the feed it is more cleanly eaten up, and there is far less waste we know. That much feed, such as corn-stalks and straw, which in a long state could scarcely be touched, will be consumed when prepared in this way, is equally matter of experience. That working cattle and especially horses, from having their food prepared in this way, are enabled to eat their food at once, and then take their rest, is an obvious, and to hard-worked animals, a great advantage; as otherwise, especially in journeys, they must work until very late at night in order to masticate their food, and thus their sleep is broken, and the morning finds them unrefreshed. But that ruminating animals, who like our milch cows are "persons of entire leisure," should find any

particular advantage in cut-feed other than as above, is a matter not so obvious; and for which a satisfactory reason is more difficult to be found.

You will not think, Mr. Editor, that I make these remarks for any disrespectful or captious reasons; but as the subject is of great importance I am anxious that so interesting an experiment should be given in the most full and detailed form.

There is no subject more nearly connected with the interest of farmers than the application of their produce in the feeding of their live stock. There is an immense waste of feed with most of us, from our ignorance of the most economical form, in which it may be used. This is particularly the case in respect to the keeping of horses, and the use of our coarse fodder for other stock; and in respect to the stall-feeding of beef animals it is a lamentable but an established fact that at common prices a farmer must consent to the actual loss of a great part of the hay which he gives them; and of course the sacrifice of his labor in procuring it. Any mode of using his hay by which half the quantity can be made to produce a great increase of milk, may be supposed to be favorable in some degree to an increase of meat; and is therefore matter of the most interesting inquiry.

QUERIES RESPECTING HEDGES.

Haverhill, February 1834.

MR. EDITOR, The time will come, no doubt, when live fences will be more common than they are. In countries where they are in general use, they furnish to the farmer a valuable supply of rough fuel when properly managed. In districts where that necessary article is becoming every year less abundant, prudence and economy admonish us to look ahead, and prepare for future necessity. Stone walls are very well where rocks are abundant. Rail and board fences are very expensive, and very unsafe. It becomes a farmer to unite in his arrangements durability, safety, and economy, and in nothing more than in fencing. If he be a man of taste, he will combine with these ornament. A good live fence, in my opinion, includes all these.

I have been used to the white thorn, the black thorn, and the crab, for this purpose; but I think they will not answer in this soil and climate. The former, I should judge, is too dry and porous, and the latter is probably too warm in summer. The Virginia white thorn, though natural to the soil, and capable of bearing the extremes of our most rigorous northern region, is decidedly too smooth for fences. I have sometimes thought of the acacia. This, however, you seem to condemn as inappropriate for the purpose. The pear in its wild state is both rough and strong, and is good fuel; but I have never known it tried for fencing. If you, or any of your valuable correspondents, know of any experiment having been made upon the pear, I should be glad to know. The truth is, sir, I want to make about 300 rods of fencing, to render my ground convenient for a better state of cul-

tivation.—In your very useful paper for the 29th of last month, I observed a statement from Mr. Derby of Salem, of a buckthorn hedge on his estate, which seemed very promising. I felt a hope when I read it, as the article came from a gentleman of much judgment and practical experience, that the time was approaching when such enclosures to our fields would be numerous. But while we are informed where Mr. Derby procured his first seedlings, and are pleased both with his experiment and success, we know not where to go to get ours. If you, sir, would insert in your paper where the seeds of the buckthorn may be procured—how managed in the seed bed, (provided there be any thing of soil, or time of sowing peculiar to them), and how old the plants should be when set out, and whether they should be placed upon the level ground; or upon a bank, you would greatly oblige yours, &c.

G. K.

By THE EDITOR. A letter from Mr. Derby to the Editor, published in the *N. E. Farmer*, vol. iii. p. 214, contains the following notices of the Buckthorn as a hedge-plant.

"After trying several kinds of trees, for the purpose of making a hedge, without much success, I was induced to try this, which has afforded a most beautiful fence, so much so as to attract the attention of every person who has seen it. It divides my garden, is about three hundred feet in length, the plants set nearly a foot apart, is five feet high, and two feet wide at top, which is cut nearly level. It shoots early in the spring, makes a handsome appearance, and continues its verdure till very late in the fall. It has not so much spine as either the English or American hawthorn, but I think sufficient to protect it from cattle. The plant bears the knife or shears remarkably, and makes as close and tight a fence as either of the others, and is not subject to blight, as both of them have been with me. You will observe, that Miller speaks of it as not so proper for hedges as the hawthorn or crab, which may be the case in England, but I cannot agree with him as it respects America.

"The tree furnishes a large quantity of seed, which rapidly vegetates; and I make no doubt it can be propagated by cuttings, which mode I shall adopt in the spring."

"The purging buckthorn shrub is so common in the hedges of many parts of England, that it is seldom cultivated in gardens. It rises easily from seeds, if they are sown in autumn soon after the berries are ripe; but if they be left out of the ground till spring, the plants will not come up till the year after. These will require no particular treatment, but may be managed in the same way as young crabs, or any other hardy, deciduous tree or shrub. It may also be propagated by cuttings or layers. If the young shoots be layed in autumn, they will put out roots by the following autumn, when they may be taken off, and either planted in a nursery, to get strength for a year or two, or where they are desired to remain."—Miller.

MASS. HORTICULTURAL SOCIETY.

FRUITS WORTHY OF CULTIVATION.

WE are happy to receive the following, which will prove very important to all Cultivators of Fruit-trees, as well as beneficial to all who are fond of the most wholesome as well as delicious luxury, which earth can produce or culture improve.—Ed.

For the New England Farmer.

MR. FESSENDEN,—Sir, Enquiries having been made through the medium of your paper, for a list of Fruits, adapted to the climate of New England, the Fruit Committee of the Mass. Hort. Society, offer to the public, the following list of Apples, Pears, Plums, and Peaches; all of them good, and many of them excellent. They do not wish to be understood as saying that the list contains all the fruits worth cultivating, but they prefer to recommend a few sorts known by experience to be good, to a large number of doubtful names, whose merits have not been sufficiently tested. Additions will be made to the list after the close of the ensuing fruit season, which will be published in the *New England Farmer*. All of the fruits enumerated, have been exhibited at the meetings of the Horticultural Society; bearing trees of most of them are now growing in the gardens of the members of the Committee, and trees can be had at any of the Nursery Establishments in this vicinity.

It may be proper to remark also, that the time of maturity of the different varieties, is designated in nearly all the nursery Catalogues, a point of much importance to be attended to, with a view to a regular succession of fruit, as well as the fact, that there are some kinds embraced in this list, which, although it would be very desirable for every fruit grower to possess a single tree, could, by no means, be recommended for extensive cultivation, whilst others might be cultivated to any extent desired. These points, as well as the relative degrees of excellence between good, better, and best, applicable to the different varieties, must be left to the taste of the cultivator, which, in the advanced state of knowledge upon the subject, it is presumed almost every one has within his reach the means of determining correctly.

From the New York Farmer.

CULTIVATION OF SILK AT MANSFIELD, CONNECTICUT.

BY B. STORRS.

Mansfield Centre, Ct. Dec. 18, 1833.

DEAR SIR,—Yours of the 30th ult. has remained so long unanswered that you may think me indifferent to the subjects of your inquiry. Not so, sir; I feel a deep interest in the growing prosperity of our country, in its various and multiplied manufacturing establishments, which are constantly springing into existence, and in none more so than in the production and manufacture of silk; none which presents, in my estimation greater encouragement, both to the agriculturist and the manufacturer—none which promises fairer to become of extensive utility and profit to this country.

With regard to the cultivation of the mulberry, and the growing of silk in this place, it may not be generally known that the business has been successfully prosecuted here for more than seventy years; but, though gradually increasing during this period, there has been but very little improvement in the method of conducting the business, or in the application of the raw material to manu-

facturing purposes, any further than the production of sewing silk and twist, and this almost exclusively confined to the labor of the family, upon the domestic spinning-wheel. But one thing has been abundantly demonstrated; that is, that the white mulberry is easily cultivated, and that the rearing of the silk-worm, and the production of silk, notwithstanding all the particularity, minuteness, and mystery, with which the subject has been treated, and invested, may be profitably pursued, with but little more knowledge or care than is requisite for the successful rearing of pigs, or poultry. Shelter them from cold, storms and wind, and feed them when hungry, whether it be in a corn-house, barn, cider-mill house, or laboratory, built on purpose for the business, a profitable crop of silk may be produced. I would not by this remark be thought to undervalue enterprise and improvement, or to treat lightly particular attention to convenience and neatness in every branch of agriculture. I highly value all the associations and societies of the present day, formed for the advancement and improvement in knowledge of the mechanic and agriculturist; but describe to a person entirely unacquainted with the manner in which wool is produced, the animal which produces it, and inform him how this animal must be reared, housed, and treated, according to the practice of some of our most wealthy and scientific farmers, its peculiar habits, and liability to disease in case of neglect, and he would be very apt to conclude, that, being unable to sustain the necessary expense, he might as well not attempt to rear an animal that required so much care and labor. So with regard to the rearing of the silk-worm, there is reason to fear that the minute particularity and delicate attention to temperature, food, cleanliness, &c. &c. with which the subject has been treated by most writers, may have deterred many from engaging in it; but let them be told, and truly too, that without thermometer, hot-house, stove-room, or laboratory, the silk-worm may be, at the proper season, hatched by the usual warmth of the kitchen; and that with a rough board to lie on, and a corn-house or barn to shelter them from wind and wet, guarded also from the depredations of rats, mice, and fowls, and well supplied with the white mulberry leaf, will produce a profitable crop of silk, they may be induced to try; and having once engaged in the business and found it practicable, may then attend to all the improvements which experience and sound wisdom may dictate. Many persons in this town, who have been for twenty or thirty years successfully engaged in the rearing of silk-worms, should you talk to them about thermometers, hot-houses, and laboratories, would not know what you meant; yet, I doubt not, a due attention to these may be profitable.

With regard to the manufacture of silk in this country, much is yet to be learned; but I consider the experiment as favorably commenced, and nothing more is wanting than that some of our enterprising and ingenious mechanics should give the subject that attention which its importance demands; and with such improvements in machinery, and the art of manufacturing, as I think the business susceptible, we may soon compete in this, as we do in some of our wool and cotton fabrics, with any portion of the world. I believe it to be a well established fact, that no part of the world now produces a better quality of the raw silk than that which is produced in this country. Since the

investigation of the subject by a resolution of Congress, and the encouragement presented by the Legislature of this State, in a bounty upon the propagation of the white mulberry, and upon raw silk, the business has received a new impulse.

The Piedmont reel has been introduced, and with some improvement in the application of a stop motion was the last season used to some extent, propelled by water and by horse power, as well as by hand, and our ingenious and industrious females find that without any further instruction in this branch, they can, with the exercise of a little more patience than the old reel required, produce a much handsomer and more valuable article than by the former method. I have now by me a sample of a few ounces, reeled by one of our ladies, which I designed to have presented at the New-York Fair, and which I think in every respect would compete with the production of any country. Thus far, then, I think we may safely say, we can and do succeed. We have also two small silk manufacturing establishments in this town, propelled by water power, in successful operation, at which single thrown silk, orgazine, tram, and every kind of silk, is prepared with ease, by persons bred to the business. The machinery is made in the manner of the most approved English machinery. At these establishments all the silk raised in this vicinity, and reeled on the improved reel as before stated, finds a ready market. Some broad goods have been made, but the business seems not yet to be sufficiently matured to go immediately into the higher branches of manufacture, but must for a time be confined to the smaller and more common articles of silk fabrics. A great proportion of the silk now prepared at our factories here is made use of in the manufacture of the Tuscany grass bonnets.

Having extended my remarks to a much greater length than I anticipated, I will mention as an apology, that having seen most of the publications on the subject which have been circulated in this country in answer to the call of Congress for information, and being well acquainted with the perfectly simple manner in which the business has ever been conducted here, I felt that a plain statement of facts, similar to those I have here given, was necessary, to counteract in some measure the influence of that scientific minuteness with which the subject was treated in those publications, and might be of public utility. Should it appear to you that I am correct in this opinion, you are at liberty to make such use of this communication as you may think proper.

Another subject of your inquiry is, whether silk-worm eggs can be procured here; in reply to which, all I can say is, I have heretofore, when applied to, found no difficulty in obtaining them, to any extent called for, and presume there would be none now.—The price, from 6 to 8 cents per thousand; and as they are attached to papers, those papers may be folded and packed in small boxes and sent safely to any part of the country by stage or otherwise.

When at New-York, last spring, I purchased a small lot of the *Morus Multicaulis*, for the purpose of introducing them into this silk-growing region. They flourished finely last summer, and if our winter climate does not prove too severe for them, bid fair to be an important acquisition to our silk growers. As I am frequently applied to from a distance for information with regard to the value

of cocoons, and of the raw silk, I will here state that we have not as yet any extensive reeling establishments, but from the success which attended the trial of the Piedmont reel the last season, I think there is encouragement to enter extensively into the business, and that probably, by another season, such preparation will be made as to afford a ready sale for cocoons, at a fair price, which is now estimated by the bushel—say \$2 50 per bushel, for fair, to \$3 00 for best. The worth of the raw silk depends much on its being reeled clean, level, and fine. For the former I have paid the above prices for several lots which I purchased the last season, and for the raw silk have paid mostly from £3 75 to \$4 00.

Respectfully,
your obedient servant,
ZALMON STORRS.

From the Brattleboro' Inquirer.

SILK WORMS.

MR. EDITOR.—I am induced to believe from the increasing attention to the culture of silk that the following experiment may be interesting to some of your readers. If you think so, do with it as you see fit.

Doubts have been expressed whether in our climate it were practicable to raise two crops, that is, two generations, of the silk worm in the same summer, and one of the peculiar merits attributed to the *Morus multicaulis*, or Chinese mulberry, has been, that it enabled the cultivator to effect this object in the climate of Long Island.

With the view of ascertaining what could be done with the common white mulberry, I took in July last, soon after they had wound, a few cocoons of four different colors—pure white, white tinged with greenish buff, buff, and orange. The pure white were small, compact and pointed, as those wound first generally are; the millers which they produced were all of one sex, and no eggs were procured. Eggs were obtained from each of the other three varieties, but those from the orange did not hatch into worms sufficiently early and were laid away for next spring. Those almost white, and the buff, produced in succession, eggs, worms, and cocoons, and though fed entirely on white mulberry, and though the season has been unusually wet and cold, have produced a crop of cocoons in all respects equal to those of their parents. It is observable, however, that those descended from buff cocoons were almost all buff, while those which came from the balls almost white, were of all the four colors. The fact ascertained, however, which I think of most importance is that *two crops may be raised in one season from the common white mulberry.* J. D. B.

Brattleboro', Sept. 21, 1833.

EXERCISE AND DIET.

THE late eccentric Dr. Danforth, of Boston, gained great celebrity in curing dyspepsia. His practice was to send his patients out of town, and he directed them to walk in, in the morning, and out at night; and moreover never to eat a mouthful after dinner, till the next morning. There are three advantages derived from this course, viz. a change of air, exercise, and abstemious habits; and this is, undoubtedly, the only philosophical course for those to pursue who suffer from dyspepsia, from causes which we have suggested, as connected with sedentary habits.

AN ADDRESS

BEFORE THE MASSACHUSETTS HORTICULTURAL SOCIETY;

At their Fifth Annual Festival, September 18, 1833.

BY ALEXANDER H. EVERETT.

PUBLISHED BY REQUEST OF THE SOCIETY.

Gentlemen of the Horticultural Society:—

IN attempting to address you on this occasion, I have consulted my wish not to appear insensible to the kindness of the request that brings me here, to a greater extent, perhaps, than prudence would justify. Though fully aware of the importance and attractive character of the art which forms the object of your institution, the nature of my pursuits through life has been such as to deprive me of the opportunity of obtaining more than a very limited acquaintance with its details; and in the absence of the resources of imagination and eloquence which others might draw upon to supply the want of actual knowledge, I must throw myself, without reserve, on your indulgence. Even the little practical information to which I might pretend on the subject of fruits, flowers, and gardens, relates chiefly to those that are found in other countries, where it has been my fortune to pass the greater part of the mature period of my life, and may not perhaps, be applicable here. May, I venture to add, that there is one particular in which my experience, in regard to foreign fruits, differs from that of some preceding travellers? The companions of Ulysses, as we are told by Homer, found, somewhere on the coast of Africa, a fruit which he calls the *Lotus*, the taste of which was so delicious, that those who had once eaten it lost the desire to return to their native country, and remained for life among the *Lote-Eaters*, who it seems, derived their political name from their favorite fruit. Critics and horticulturists are not agreed as to the precise fruit intended in this passage. Whatever it may have been, it has not been my fortune, in the course of my travels, to taste it; and I have generally found that the fruits and flowers which pleased me best in other countries, were those which brought most vividly to mind the recollection of my own.

Horticulture, in its simplest application, proposes to improve the qualities of vegetables, flowers, and fruits. In its higher departments, it assumes the character of one of the elegant arts, and teaches the disposition of grounds and gardens, whether intended for the recreation of individuals, the ornament of cities and palaces, or the repositories of the dead. Permit me to say a few words upon each of these divisions of the subject.

I. The first in order and in immediate practical importance of the objects of Horticulture, is the improvement of the qualities of vegetables, fruits, and flowers, including the introduction of new and valuable varieties from foreign countries. "I am astonished," says an elegant French writer, "at the indifference with which we regard the names and memories of those who have naturalized among us the fruits and flowers of other climates." The case was not the same among the Romans. Pliny makes it his boast, that of the eight sorts of cherries known at Rome in his time, one was called the *Plinian*, in honor of one of the members of his family, who had brought it into Italy. The other seven, also, bore the names of the most distinguished families, including the Julian, which was that of the Emperors. The first cherry trees were brought to Rome from Pontus, in Asia Minor, by Lucullus, after the defeat of Mithridates, who was

king of that country. In less than a century they had spread themselves over the whole of Europe,—even in the then remote and barbarous island of Britain. The distinguished naturalist to whom I just alluded, also commemorates the good fortune of Pompey the Great, and the Emperor Vespasian, in having carried, in their triumphant entries into Rome, on their returns from their campaigns in Syria, the Ebony-tree and the Balm of Gilead.

Modern nations have not, however, been entirely regardless of the services of eminent individuals in this particular. France herself bestowed upon one species of the same fruit, which bore, in ancient times, the names of Caesar and Pliny, the scarcely less illustrious one of Montmorency. She also gave to our "fragrant weed" its scientific appellation of *Nicotiana*, in honor of Nicot, her Ambassador in Portugal, who is supposed, in France at least, to have introduced it into Europe, although the merit is attributed, in England, to Sir Walter Raleigh. Her writers have gratefully recorded the service rendered to the West of Europe by Busbeck, an Austrian Ambassador at Constantinople, who brought home with him from his embassy, the Lilac, one of the most beautiful of our flowering shrubs. Of late years it has even become common to designate the most curious and beautiful sorts of non-descript plants, as they are discovered, by the name of the discoverer or that of some other person of high scientific fame. Thus the laurel of our woods has obtained its scientific name of *Kalmia*, from the Swedish naturalist, Kalm; while his countryman, Dahl, has furnished one to the plant, whose brilliant and various flowers, though so recently naturalized among us, already adorn all our gardens, and contribute so much to the beauty of your exhibitions.

In the culture of flowers, the Dutch have perhaps excelled all other nations. Their taste is, however, somewhat limited in its objects, and confines itself almost exclusively to the tulip, the rose, and the hyacinth. The rage for tulips, that prevailed at one time in that country, and the extravagant height to which the conventional value of particular varieties was carried, are well known. A pressure in the tulip market was then nearly as serious a thing in Holland as a pressure in the money market is in this country at the present day. Although the taste for flowers no longer exists to the same degree as it once did in Holland, that country is still the place where they are most extensively cultivated, and whence they are sent as articles of merchandise to all parts of the world. The principal tulip and hyacinth gardens are at Haarlem. The largest that I saw there contained not less than three or four acres of ground, and was really a brilliant spectacle. The principal rose-gardens are at Nordwyck, on the German Ocean. In the tulip gardens every variety has its name, derived commonly from some great political character, and has its fixed price in the florist's catalogue. We have seen, during the present season, a specimen of one of these tulip gardens, laid out on a small scale by one of your members, in which a considerable number of the most curious and brilliant varieties were collected in one parterre. In selecting the individuals whose names they affix to their favorite plants, the florists display a very laudable impartiality, and take them alike from all countries and all parties. We saw, for example, in Mr. Walker's little collection, a *Lewis the Fourteenth*, a *Bonaparte*, and a *Washington*, blooming very amicably, side by side, in the

same enclosure. There is even room to suspect that these names were not bestowed with any reference to intellectual capacity or moral worth; but rather, perhaps, under the influence of a slight tincture of *legitimacy*. *Lewis the Fourteenth*, was, by far, the most brilliant flower in the collection, and commanded the high price of ten guineas, while *Bonaparte* and *Washington* mingled rather obscurely with the common herd, and might be had for about five shillings a-piece.

Washington has been rather more fortunate in fruits than in flowers. His name, as I am told by one of your most distinguished members, has lately been given to a new and most delicious variety of Pears, which, though very recently introduced, is said to have already eclipsed the reputation of the St. Michael's and the St. Germain's.

Our barren soil and wintry climate do not admit of a very luxuriant vegetation, and we can never hope to naturalize among us the magnificent products of the tropical climates, which either perish at once or dwindle into comparatively dwarfish shapes. We possess, however, most of the flowers and fruits which thrive in the corresponding temperate regions of the old world. The Queen of Flowers presides in our gardens, as in those of Greece and Persia; and the King of Fruits, as the vine has sometimes been emphatically called, covers our rocks with a royal mantle of spontaneous verdure. In improving these natural gifts to the utmost, we have ample scope for the exercise of skill and taste. The culture of the Vine may, perhaps, be mentioned as one of the branches of your art, which deserves more attention than it has yet received. The best European wines, such as Champagne, Burgundy, and the various sorts of Rhenish and Moselle, which have recently become such general favorites among us, are all produced in latitudes considerably higher than ours. Where the Vine grows spontaneously with great luxuriance, there is reason to suppose, that, with proper care, its fruit may be brought to any degree of perfection. When the northern navigators from Iceland visited the coasts of this country, seven or eight hundred years ago, and made a settlement on a spot, probably not very distant from the territory we occupy, they were so much struck with the luxuriant growth of the Vine, that they gave to their discovery the name of *Wineland*, which was thus, by a rather singular accident, appropriated to one of the few countries within the temperate regions of the Christian world, where no wine was ever made. A more general and careful cultivation of the Vine may, perhaps, enable us to justify the application of this ancient title, and furnish the community at a cheap rate, with a palatable, healthy, and refreshing substitute for ardent spirit, which the friends of temperance among us are now so earnestly endeavoring to banish from general consumption. [To be continued.]

From the *Genesee Farmer*.A NEW AND VALUABLE GRAPE, THE
"TO KALON."

On a recent tour to the east, a friend of mine from Lansingburgh informed me that the widow of the late Dr. Spafford had growing in her garden and now bearing profusely, a new and valuable grape, a seedling from a foreign variety, originated by her husband. The variety from which it was produced he was not able to inform me. It is described as a purple grape of an oval shape, larger

than the Isabella, close set upon the cluster, very delicious, pronounced by some foreigners from vine growing countries equal to any they have seen in Europe, a very great bearer, and what renders it particularly valuable in this climate, is perfectly hardy, as much so as any of our native grapes. As a proof of its hardiness and adaptation to our climate, it endured the severity of the winter before last, *uncovered, without sustaining any injury*, while in some parts of our country, some of our native varieties were nearly killed.

The gentleman who communicated this information, agreeable to his promise, has recently forwarded a box of the cuttings of this grape, with a communication, in which he says: "I last Saturday sent to Troy a box of grape vines, to be forwarded by canal to you. There is but one kind, the 'To Kalon,' or Spafford Grape, now considered here *the finest we have*." If as fine as described, it is worthy its name, "*To Kalon*," the beautiful and good. This American daughter of an European parent, will prove a valuable acquisition to the American vigneron and horticulturist, and will add one more to our choice hardy grapes; while it affords another proof of the truth of the theory advanced by the present writer in a former number of the Gen. Farmer, that the only true way to acclimate the European grape (*Vitis vinifera*) is to raise it from the seed. This successful experiment of our late distinguished citizen, and friend and patron of agricultural and horticultural science, Dr. Spafford, should stimulate others to like experiments, to obtain new and choice hardy varieties, by sowing the seed of the best European kinds. We have several valuable hardy grapes which have been produced in this way. The *Herbemont's Madeira* (called after the distinguished gentleman who was supposed to have originated it, in South Carolina, and who has done much by his writings in the Baltimore American Farmer, to promote the knowledge and practice of this interesting branch of rural industry,) is a seedling of a hardy character adapted to our climate, and said to be a very superior grape for wine and for the table. It is the grape which he principally cultivates in his vineyard, for wine; of a thin skin, and abounding in a rich purple juice. Such is its hardy character, that it was thought by some to be a native American grape; but Mr. Herbemont considers it a seedling of a European variety, though not produced by himself. It is well known that most of the valuable varieties of grapes cultivated in Europe, have been originated by sowing the seed. It is thus that new varieties are constantly formed. We, Americans, by the same practice, may derive the same advantage, with the additional advantage to us, of obtaining vines adapted to our climate. We are glad to see that the attention of our nurserymen and cultivators is awakened to the subject, and that experiments are now making. We anticipate, as we have reason, the most favorable results.

W. W. B.

Hammond's Port, Dec. 19, 1834.

PRUNING TREES.

WE notice that some of our neighbors have already commenced pruning their fruit and shade trees. This operation had better be omitted until the month of May, or even the forepart of June, as the wounds made by cutting off limbs at that season, will sooner be covered with new wood, than those made by cutting wood during the winter.

The pruning of fruit trees may be omitted, until after they have passed the flower, and the young fruit begins to show itself; the limbs to be cut away can then be selected more judiciously with regard to the crop. Ornamental trees may be trimmed as soon as they begin to leaf out.—In cutting off limbs, a small cut should always be made on the lower side first, then the limb may be cut or sawed upon the upper side without danger of splitting down when nearly taken off, which often happens when this precaution is not taken.—*Goodsell's Farmer*.

CATTLE IN ENGLAND.

OUR readers have an example in the following extract, of the great increase that is given to human sustenance by improvements in live stock.—*N. Y. Farmer*.

"A century ago, our cattle, from the inferiority of their food, were not one-half, sometimes even not one-third, of the present weight.—It is computed that England and Wales now contain at least five millions of oxen, and a million and a half of horses of which about a million are used in husbandry, 200,000 for pleasure, and 300,000 are colts and breeding mares. The number of sheep is about twenty millions, and eight million lambs. The number of long-woolled sheep is about five millions, their fleeces averaging 7 to 8 lbs.; and of short-woolled sheep fifteen millions, the weight of fleece averaging from 3 to 3½ lbs. The whole quantity annually shorn in England is from eighty to eighty-five millions of pounds. The Merinos were introduced about the beginning of the present century, and were imported in large numbers after our alliance with Spain in 1809. The great pasturage counties are Leicester, Northampton, Lincoln, and Somerset; and for butter and cheese, Cheshire, Gloucestershire, and Wiltshire. The import of butter and cheese from foreign countries is checked by duties, but these are important articles of Irish commerce with England."

From the *Hallowell Me. Free Press*.

BLACK OR SCALT TONGUE.

THIS is a disease that has prevailed to a very great extent among horses and cattle through the country during the present winter. We have seen many remedies published in different papers, but have heard of none but such as are either expensive or not easily to be procured by our farmers generally, till a neighbor of ours, who keeps a large number of horses, and who has had a number of cases among them, and also among his cows, a few days since, informed us of the following simple remedy, which he has tried with complete success. It has also been tried by the keepers of livery stables in this town, and has invariably effected a speedy cure:

Take the bark of the common Juniper, (commonly denominated "Hackmatack,") and boil it thoroughly till the water becomes very dark colored, nearly black, the stronger the better. With this decoction wash the mouth of the diseased animal inside and out, as often as convenient, three or four times a day at least, and also wet their provender with it. Potatoes soaked in this decoction are also very beneficial.

All who have made use of the above remedy declare it not only more simple but much better than any other that has come under their observation.

CULTURE OF SILK.

WEDNESDAY, in the House, the bill to encourage the cultivation of Mulberry Trees, and the production of Silk, was passed to a third reading. This bill gives a bounty of two dollars for every hundred of trees set out at the rate of 600 to the acre, and one dollar for every pound of domestic reeled silk. The consideration of the above bill was attended by a very interesting debate, in which the following gentlemen took part: Messrs. Gray, Moseley, Rockwell, Eustis, Thayer, Chapman, Forward, M'Kay, Lincoln, and Kinsman. Mr. Moseley communicated much interesting information. He stated that the Mulberry tree would grow in any country between 20 and 50 degrees of latitude—that sandy and gravelly soil suited it best—that the required labor could be performed by children, and that 600 lbs. of silk, worth \$3 per lb. could be obtained from the worms fed on the trees, which could be raised on one acre of ground.

Mr. Chapman, of Greenfield, who opposed the bill, made some judicious remarks as to such articles as are ornamental, and such as are useful. But the question was not whether our people had better wear silk, but whether, if they will wear it, it is best that a good part of it should be produced in this country, or that nearly the whole should be imported. Mr. C. wished our farmers' wives and daughters should be able to procure silks at 50 cents a yard, rather than at a dollar. Domestic competition may effect this. But, if we do not choose to wear silk, we may produce it to export.

MASS. AGRICULTURAL SOCIETY.

MR. RICHARD JAKUES' CULTIVATION OF A PREMIUM CROP OF WINTER RYE.

Newbury, Nov. 22, 1833.

To the Secretary of the Mass. Agricultural Society:

SIR, I send you a statement of a crop of winter rye raised on one acre of land the present year, which I wish to enter for premium. The land is a sandy loam. It was planted with corn in the spring of 1832, and manured in the hills with about three cords of manure of common quality. The third day of August I sowed one bushel of rye on the acre and hoed it in the usual manner; in the month of August of the present year the rye was reaped and threshed, and found to measure thirty-five bushels and three-fourths of a bushel.

RICHARD JAKUES.

I hereby certify that I assisted in gathering threshing and measuring the above mentioned rye, and there was thirty-five bushels and three-fourths of a bushel.

RICHARD T. JAKUES.

I hereby certify, that I measured the land on which the above mentioned crop of rye was raised and found it to contain one acre and no more.

WADE ILSLEY, Surveyor.

Essex, ss. Nov. 25th, 1833.—Personally appeared, the above named Richard Jaques and Richard T. Jaques, and made oath to the truth of the above certificates, by them severally subscribed before me.

SILAS MOODY, Justice of Peace.

Essex, ss. Dec. 10, 1833.—Personally appeared the above named Wade Ilsley, and made oath to the truth of the above certificate by him subscribed, before me.

SILAS MOODY, Just. of Peace.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, FEB. 19, 1834.

EXPERIMENTAL HUSBANDRY.

In our last, page 246, we published an article detailing certain experiments made by GORHAM PARSONS, Esq. of Brighton, Mass. We shall now advert to that gentleman's row or drill culture of wheat, as given by him, in the communication alluded to.

Sir John Sinclair has the following, among other remarks on the subject of Drill Husbandry: "In comparing the drill and broad-cast systems, the following maxims may be laid down: 1. That it is of little or no advantage to drill autumn or winter sown wheat, as the crop is rarely injured by annual weeds, and they can be easily and completely extirpated by hand hoeing, and weeding; and when the soil is much infested by root weeds, as the crop in ordinary cases will completely meet in the rows before the root-weeds make much appearance, it is impossible without injuring the crop to render much benefit to the land by the hoe. 2. On all lands where annual weeds are abundant, and where a number of hands can be procured for using the hoe, white crops, sown in the spring, may be drilled, for the advantage of clearing the land more effectually. By weeding broad-cast crops carefully, an addition of four and a half bushels of wheat, fifteen bushels of barley, and ten of oats has been obtained. The adoption of that practice, therefore, would probably equal the average advantage from drilling; so that the difference between broad-cast crops, properly weeded, and the drilled, may not be material. 3. That though the hoeing of the crops, and the stirring of the soil, has not been injurious in light soils like those of Norfolk and Suffolk, where drilling has succeeded; yet where the soil is fertile, by nature, or enriched by art, drilling forces up the straw, and consequently diminishes the quantity and quality of the grain in so great a degree as to render the crops unproductive. Hence in rich soils drilling has been so frequently given up, and hence it is that Tull probably considered dung as prejudicial.

"There doubtless must be some radical defect in the system of drilling, when after a full trial of its merits by a number of intelligent farmers in several districts, but more especially in the counties of Hertford and Lincoln, it has been given up, with hardly an exception, in so far as respects crops of grain. These facts confirm the almost general opinion throughout the kingdom, that drilling will be found to answer to a certain extent, and with a certain degree of skill and attention; but when the scale is extended the attention is apt to flag, and the conclusions drawn from one or two fields are not found applicable, unless where the operation is very skilfully conducted, to a whole farm."—*Code of Agriculture.*

Dr. Deane, in his *New England Farmer*, Art. "New Husbandry," after mentioning the various impediments to drilled and hoed crops of grain, which are peculiar to a new and rough land, and of course more applicable to this country than to Great Britain, observed as follows:

"I have not mentioned these things with any view to deter my countrymen from attempting to apply the new mode of culture to winter grain. There is nothing that I more sincerely wish than to see careful experiments made with it. But I think this caution ought to be observed, never to

attempt to raise spring wheat or spring rye in this manner. Though I have never read nor heard of horse hoeing spring wheat in England, I have known it tried by several persons to their mortification and loss in this country. The crops were so entirely blasted as to be scarcely worth reaping. This has been the case, when the culture has been conducted by some of the most judicious persons, with great attention and with the proper apparatus. The true reason of their miscarriage I take to be this, that as spring grain ripens later than winter grain, and hoed later than unhoed grain, it could not be ripe till sometime in August, when some of the nights are so cold as to blast the grain, by stopping the ascent of the sap.

"But let the new husbandry be tried on winter wheat, sown in August or September, on a warm soil with a southern exposure, and where there are no stones, nor any other obstacles; and let the seed be brought from some place at least a hundred miles northward. If with these advantages for ripening early, and in favorable seasons, a good crop of wheat cannot be obtained, it will not be worth while to make further trials. But it should be tried on rye also; for as that is known to be a hardier grain than wheat, it is probable that it may answer better in this husbandry.

"We need not be at the expense of procuring drill ploughs and horse hoes, to make experiments of these kinds. After the ground is ploughed into ridges and well harrowed, the channels may be expeditiously made two inches deep with the head of a common rake. The horse hoeing may be well enough performed with a common horse plough, passing it twice in a furrow, if found necessary, that the ground may be stirred to a sufficient depth."

It appears from the authorities above quoted that the most eminent agriculturists are divided in opinion relative to the drill culture of white crops. Besides, Sir John Sinclair was of opinion that little or no advantage could be obtained from the row culture of *winter wheat*; and Dr. Deane advised to try the new husbandry on winter wheat, but not attempt the horse hoeing, or row culture of *spring wheat*. And, whereas those doctors disagree, we must look to other practitioners. Mr. Parsons, however, has taught us that rows of wheat should not be sown so thick as 15 inches apart, as a general rule. We are inclined to the opinion that the row culture of wheat is not expedient except as an experiment, as was the case with Mr. Parsons, or when it is the wish of the cultivator, as it probably was in the case alluded to, to make the most of his seed without regard to the labor and expense bestowed on the crop.

Some remarks on the modes of cultivation adopted in obtaining large crops of Indian corn, must be deferred to our next.

CURE FOR A FILM IN THE EYE OF A HORSE OR AN OX.

EDWARD S. JARVIS, Esq. of Surry, Me. in a letter to Mr. Joseph R. Newell, proprietor of the Boston Agricultural Warehouse, states as follows:

Have you ever heard of a cure for a film on the eye of a horse or an ox? I was told of one eighteen or twenty years ago, and have been in the practice of it ever since with perfect success. It was brought to my mind by just having had a proof of its successful application in a calf that had its eye hurt by a blow from another creature. A film formed over it, and it was thought its eye was lost. But

by turning into the opposite ear a great spoonful of melted hog's fat, it was cured in 24 hours. I do not pretend to account for this, but I have seen it tried with success so often, that I think it ought to be made public, if it has not been before. I learned it of an Indian.

WINNOWER MILL.

On our first page of this day's paper we have presented to our readers a cut of Elliot's Patent Winnower Mill, which we believe to be a very valuable implement. We are informed that the right of making, vending and using this article may be had of John Springer of Sterling, Mass. or of J. R. Newell, Agricultural Warehouse, No. 52 North Market street, Boston, where the mills are for sale.

A HINT.

Persons who write for the press, and especially where haste in publication is unavoidable, should write only on one side of the sheet of paper.—Writing on both sides of the paper, creates difficulty and confusion in dividing the matter among the compositors.—*Sag Harbor Watchman.*

ITEMS OF INTELLIGENCE.

A Company has been formed at Calcutta, to facilitate the travel between England and India, via the Red Sea, by steam. The Government of India has offered a reward of \$100,000 to any person or company, who shall make four voyages a year, leaving the proprietors the profits of passengers and letters.

A correspondent of the Norfolk Beacon, writing from St. Barts, under date of the 10th ult, says: "The West Indies are now in a deplorable state—poverty has overtaken many since you left here, and is making rapid and quick marches upon many others.

Deaths by Consumption.—By actual calculation, it appears for the last three years one fourth of the deaths which have occurred in Portland, Me. have arisen from consumption, the primary cause of which, says the editor of the Courier, a shrewd feeling man, is the abominable practice adopted among the young girls of tight lacing, and the insufficiency of clothing in its season, which is not endured from poverty, but imposed by fashion.

Stains by Fruits.—Are readily removed from clothes by wetting them, and placing them near lighted brimstone; a few matches will answer the purpose.

BRIGHTON NURSERIES.

MESSRS. WINSHIP have the pleasure of announcing to the public, that a part of their importation of new and rare productions to this country have arrived, among which are the following new and leading kinds of Scotch Gooseberries, and are now ready for delivery;—they can be securely packed for this or any other country, and afforded at the lowest Catalogue prices,—with a liberal discount by the hundred—viz.

Reds. Roaring Lion, Lancashire Lad, Jubilee, Jolly miner, Emperor, Nonsuch, Ringleader, Prince Regent.
Yellow. Yelle de Paris, Nelson's Waves, Fine bobbin, Hood, Combemere, Waterloo, Cottage Girl, Blacksmith, Suffolk.
Green. Ocean, Favorite, Evergreen, No bribery, Fairy, Green grove.

Whites. Queen Ann, Smiling beauty, Vittoria, Glory, Conquering hero, Queen Caroline, Winslam lass, Noble landlady. Also, at the proper season for removing hardy plants, the most extensive varieties of FRUIT, ORNAMENTAL and FANCY productions, that are cultivated in this country; all of them well acclimated; consequently, in the estimation of most persons better adapted to endure the severity of our climate, than those imported from more southern and milder temperature.

Orders may be left with GEO. C. BARRETT, Agent, 52 North Market street, Boston, or forwarded to Messrs. WINSHIP, Brighton, Mass. by mail or otherwise. Catalogues for gratuitous distribution at the N. E. Farmer Office and Seed Store of Geo C. Barrett. f19

REDUCTION IN PRICES OF TREES, &c.

WM. PRINCE & SONS have determined in consequence of the pecuniary pressure, to reduce the prices of a great variety of Trees and Plants, where orders are sent for a considerable amount: and all persons who desire Fruit and Ornamental Trees; Flowering Shrubs and Plants; Greenhouse Trees and Plants; Splendid Dahlias; or Seeds—will on applying to them direct by mail, with a list of the articles wanted, be promptly furnished with a printed sheet explaining the reduced rates.—The Chinese Mulberry, or *Morus multicaulis* are now reduced to \$25 per 100, and \$4½ per dozen.—Apple trees in great variety \$20 to \$25 per 100.—Pears \$37½ per 100, and extra large ditto 50 cents each; and 50,000 are two, three, and four years grafted.—Peaches \$20 and 25 per 100.—Large Orange Quinces \$30 per 100.—English and Spanish Filberts \$25 per 100.—Fine Red Raspberries \$6 per 100.—Large Red and Yellow Antwerp \$16 per 100.—Gooseberries, finest Lancashire varieties \$20 per 100; and Large Red White and Black English Currants \$16 per 100.—Isabella Grape, 3 years old vines \$25 per 100, and 2 years ditto \$20 per 100.—Catawba, Alexander, Winne, York Claret, York Madeira, and Scuppernon, \$25 per 100.—Hermont's Madeira, Troy and Elsingburgh, \$30 per 100.—Norton's Virginia Seedling \$35 per 100.—The collection of choice European Grapes is unrivalled.—Chinese Ailanthus, 4 feet high, \$4½ per dozen and larger sizes in proportion.—A reduction is made on a great many kinds of Roses, Pæonies, Chrysanthemums, &c.—Double Dahlias of such fine assorted kinds as have been most increased, will be supplied at \$3, \$4, and \$6 per dozen, according to excellence, and selected by ourselves. The roots can be sent to any distance.—The new varieties of Flemish and English Pears having been introduced by us and greatly increased, the prices of the greater part have been reduced, and the trees are mostly of fine size and three years ingrafted.—The Ornamental Trees and Shrubs of most kinds are large and thrifty, and of double or treble the value of smaller ones, which is a most decided advantage, being a gain of several years in embellishment.

N. B. Having no Agent at Boston, the Commission of 10 per cent. usually allowed for Agency, will be credited to the purchasers, and be deducted from the amount of the bills rendered. The stock of Dahlias being so very large, they will be furnished on the most favorable terms possible.

Linnean Botanic Garden and Nurseries,
Flushing, near New-York, Feb. 10, 1834.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus multicaulis* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumachs, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, *Montan* and *Papaveracea*—and 24 other kinds—and 33 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early—Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea.—Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

MANUAL OF THE MULBERRY.

Just published, the second edition of Cobb's Manual, containing information respecting the growth of the *Mulberry Tree*, with suitable directions for the culture of SILK, in three parts. This edition is an improvement. Price 50 cents.

For sale, by GEO. C. BARRETT, N. E. Farmer Office.

TO BE LET

THE whole, or part of a Farm, in the vicinity of Boston, containing about 95 acres of good land, with a convenient House, Barn, and out houses—of which possession may be had on the 1st of April next—Provided application is made by a capable, steady and industrious man, of good moral character, and who has been educated in the business of Farming, and who will produce a good recommendation of such qualifications—and none other need apply.

For further information, enquire of the proprietor and publisher of the New-England Farmer, at his Office, Nos. 51 & 52, North Market Street, Boston.

NOTICE.

THE Trustees of the Society of Middlesex Husbandmen and Manufacturers, will hold their Annual Meeting at *Shepherd's Hotel*, in Concord, on Tuesday, 25th inst. at 10 o'clock, A. M. A punctual attendance is desirable.

All persons having claims for premiums, or agricultural experiments, will present the same at this meeting accompanied by vouchers. J. STACY, Secretary.

MASS. HORTICULTURAL SOCIETY.

A meeting of this Society will be held at their hall, No. 81, Cornhill (lately Market Street), on Saturday next, 11 o'clock. f 19 ROBERT TREAT PAINE, Rec'g. Sec'y.

NEW STRAW CUTTER.

LUCKEY'S New Invented Straw Cutter, lately introduced into this city, will be exhibited at Gilson's Livery Stable in Washington street, To-Morrow (THURSDAY) Afternoon, at 3 o'clock, P. M.—At the same time and place, Eastman's machine will be operated, and gentlemen will be enabled to compare the utility of the two machines, side by side. Gentlemen who feel interested in the introduction of a valuable improvement, are invited to be present. DAVID P. KIRBY.

WANTED,

AN Assistant Gardener, who can produce good recommendations. Apply at this office. f 19

SITUATION WANTED.

A situation wanted by a Gardener, a married man who has no family, who could engage his wife as cook. Good recommendations can be given. Apply at this office. f 19

BULL FOR SALE.

A first rate Durham Short Horned Bull, bred by the late Thomas Williams, of Noddle's Island—three years old. Got by Cicero, dam an imported Cow. Cicero by Col. Jacques's imported Bull Coelebs. Enquire of G. C. BARRETT, at this office. Feb. 12.

GRASS SEEDS.

20 CASKS of Superior NORTHERN CLOVER; 200 Bushels TIMOTHY or HERDS GRASS, for Sale, Wholesale and Retail. Now is an excellent opportunity for Merchants and Traders to obtain their spring supply—being low, will be sold for Cash only.

GEO. C. BARRETT, New-England Seed Store, North Market Street, Boston.

BIRD SEEDS.

Just received a fresh supply of Canary, Hemp, Millet, Maw and Rape Seeds.

GARDEN SEEDS.

200 BOXES of Assorted GARDEN SEEDS for Traders, papered up in small papers at 6 cts. each, for retailing, and warranted of best quality and vitality.

For Sale at the Seed Store, Nos. 51 & 53 North Market Street.

BRIGHTON CATTLE FAIR HOTEL.

THE subscriber has taken a lease of the Brighton Cattle Fair Hotel, and has conditioned in his lease from the Directors approved at a meeting of the corporation, to use his best exertions to keep an orderly, well provided, and well attended House of Entertainment for Public Accommodation. He feels no disposition to interfere with the rights of any men or body of men associated for the purpose of drawing custom from this establishment, built, as he is informed, for the purpose of accommodating the public, particularly the Drivers and Dealers at this market, who have frequented it for many years past. But he will pledge himself to the former customers, to the present customers, and to all who may hereafter favor him with their patronage, to endeavor, so far as in his power, to deserve it, by constant and unremitting attention on his part, the only means he has to obtain and secure it.—Those persons throughout the Commonwealth, and in the neighboring and other States in the Union, and all whose business leads them to Brighton, are requested to make favorable notice of this advertisement, and oblige their obedient servant, Z. B. PORTER.

Gentlemen and parties from the city will also find good accommodations, and every thing usually found in an establishment of this kind.

Brighton Cattle Fair Hotel, Feb. 5, 1834. f

BRIGHTON CATTLE FAIR HOTEL.

THE Directors of the Cattle Fair Hotel, have the pleasure of announcing to the public, that they have selected a gentleman to conduct their house, (Mr. Z. B. Porter,) who, in their opinion is well qualified; possessing a proper sense of morality, with obliging and active habits, which fits him in a peculiar manner to conduct an establishment built by the patriotic contribution of gentlemen, whose only object was to establish good accommodations for the great public to transact their business in, and as a pleasant resort for innocent amusement. With these impressions, the Directors recommend him to the public patronage, with a determination to render the establishment what the public convenience requires.

By order of the Directors, CHARLES HEARD, Clerk. Brighton, Feb. 5, 1834. f

BRIGHTON MARKET.—MONDAY, FEB. 17, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 450 Beef Cattle, and 924 Sheep, divided as follows:

At BRIGHTON—307 Beef Cattle and 424 Sheep.—20 Beef Cattle and 100 Sheep unsold.

At CAMBRIDGE—253 Beef Cattle (including 78 unsold last week), and 509 Sheep (including 136 unsold last week.) 100 Beef Cattle and from 200 to 250 Sheep unsold.

PRICES. Beef Cattle.—Sales were not so good as last week. We noticed only two yoke taken for \$6. We quote prime at \$5 25 a 5 67; good at 4 67 a 5; thin at 4 a 4 33.

Sheep.—Dull; the last at market were not sold. We noticed a few lots taken at 4 50, 5 50 and 6. There were some at market which cost 12 each of the feeder—not sold.

WANTED.

A faithful young man (unmarried) who can come well recommended, to take the work of the Farm and Garden of a small family. Apply at this office.

MISCELLANY.

From the Token for 1834.
FLOWERS.

BY MRS. SIGOURNEY.

I'LL tell thee a story, sweet,
Here under this shady tree,
If thou'lt keep it safe in thy faithful breast,
I'll whisper the whole to thee.

I had a lover, once,
In my early, sunny hours,
A fair and fanciful youth was he,
And he told his love in flowers.

I remember its waking sigh—
We roam'd in a verdant spot,
And he cull'd for me a cluster bright
Of a purple Forget-me-not.

But I was a giddy girl,
So I toss'd it soon away,
And gather'd the dandelion buds,
And the wild grape's gadding spray.

He mark'd their blended hues,
With a sad and reproachful eye,
For one was the symbol of thoughtless mirth,
And one of coquetry.

Yet he would not be baffled thus.
So he brought for my chrystal vase,
The rose geranium's tender bloom,
And the blushing hawthorn's grace.

And a brilliant and fresh bouquet, §
Of the moss rose buds he bore—
Whose eloquent brows with dew drops pearl'd,
Were rich in the heart's deep lore.

I would not refuse the gift
Though I knew the spell it wove,
But I gave him back a snow white bud,
"Too young, too young to love."

Then he proffer'd a myrtle wreath,
With damask roses fair,
And took the liberty—only think,
To arrange it in my hair.

And he prest in my yielding hand,
The everlasting pea,
Whose questioning lips of perfume breath'
"Wilt thou go, wilt thou go with me?"

Yet we were but children still,
And our love though it seem'd so sweet
Was well express'd by the types it chose,
For it passed away as fleet.

Though he brought the laurus leaf
That changes but to die,
And the amaranth, and the evergreen,
Yet what did they signify.

Oft o'er his vaunted love
Suspicious moods had power,
So I put a French marigold in his hat,
That gaudy, jealous flower.
But the rootless passion shrank
Like Jonah's gourd away,
Till the shivering ice plant best might mark
The grades of its chill decay.

And he sail'd o'er the faithless sea,
To a brighter clime than ours—
So it faded that fond and fickle love,
Like its alphabet of flowers.

ROMAN MORALS.

THOSE we call our slaves; in relation to whom it is a very good rule which is given by some men, first to make them do their work as day laborers, and then pay them honestly what they have earned.

Cicero's Offices (or Duties), Book I.

From the Poughkeepsie Republican.
GOLDEN RULES

To render young Tradesmen respectable, prosperous, and wealthy.

1. CHOOSE a good and commanding situation, even at a high rent or premium; for no money is so well laid out as for a situation, provided good use be made of it.

2. Take your shop door off its hinges at seven o'clock every morning, that no obstruction may be opposed to your customers.

3. Clean and set out your windows before eight o'clock; do this with your own hands, that you may expose for sale the articles which are most saleable, and which you most want to sell.

4. Sweep before your house; and, if required, open a footway from the opposite side of the street, that passengers may think of you while crossing, and that all your neighbors may be sensible of your diligence.

5. Wear an apron, if such be the custom of your business; and consider it as a badge of distinction, which will procure you respect and credit.

6. Apply your first returns of ready money to pay debts before they are due, and give such transactions due emphasis by claiming discount.

7. Always be found at home, and in some way employed; and remember that your meddling neighbors have their eyes upon you, and are constantly gauging you by appearances.

8. Re-weigh or re-measure all your stock, rather than let it be supposed you have nothing to do.

9. Keep some article not usually kept, or sell some current article cheap, that you may draw new customers, and enlarge your intercourse.

10. Keep up the exact quality and flavor of all articles which you find are approved of by your customers, and by this means enjoy your preference.

11. Buy for ready money as often as you have any to spare; and when you take credit, pay to a day, and unasked.

12. No advantage will arise to you from any ostentatious display of expenditure.

13. Beware of the odds and ends of stock, of remnants, of spoiled goods, and of waste, for it is in such things your profits lie.

14. In serving your customers be firm and obliging, and never lose your temper, for nothing is got by it.

15. Always be seen at church or chapel on Sunday, never at a gambling table; and seldom at the theatre or places of amusement.

16. Prefer a prudent and discreet, to a rich and showy wife.

17. Spend your evenings by your own fireside; and shun a public house or a Scottish club (yea, even a Caledonian) as you would a bad debt.

18. Subscribe, with your neighbors to a book club; and improve your mind, that you may be qualified to use your influence with credit to yourself and advantage to the public.

19. Take stock every year, estimate your profits, and do not spend above their fourth.

20. Avoid the common folly of expending your precious capital upon a costly architectural front; such things operate on the world like paint on a woman's cheek—repelling beholders instead of attracting them.—[We don't know what to say to this rule.]

21. Every pound wasted by a young tradesman is two pounds lost at the end of three years, and sixteen pounds at the end of twenty-four years.

22. To avoid being robbed and ruined by apprentices and assistants, never allow them to go from home in the evening; and the restriction will prove equally useful to servant and master.

23. Remember that prudent purchasers avoid the shop of an extravagant and ostentatious trader—for they justly consider that, if they deal with him, they must contribute to his follies.

24. Let these be your rules till you have realized your stock, and till you can take discount for prompt payment on all purchases; and you may then indulge in any degree of expense which your habits and sense of prudence suggest.

John finished his reading; mothers and children partook of a flagon of hot spiced elderberry wine, which the housekeeper produced; and grandpapa kissed the little ones at parting, and said this had been one of the most satisfactory days in his pilgrimage of threescore and ten years.

COTTON GOODS
AT REDUCED PRICES.

ELLIAB STONE BREWER, 414 Washington st. (South End.) offers for sale, the largest assortment of COTTON GOODS, to be found in any retail store in the city, at very reduced prices, viz.

AN ADDRESS

BEFORE THE MASSACHUSETTS HORTICULTURAL SOCIETY;

At their Fifth Annual Festival, September 18, 1833.

BY ALEXANDER H. EVERETT.

PUBLISHED BY REQUEST OF THE SOCIETY.

(Concluded from p. 352.)

II. THE disposition of grounds and gardens, whether for the purpose of private recreation or public utility and ornament, is another application of Horticulture, not less interesting and important than the immediate care of fruits and flowers. Under this aspect, it is justly regarded as one of the elegant arts, and has engaged the attention and employed the pens of some of the greatest men of ancient and modern times. Among the English writers on the subject, we find Horace Walpole, Sir William Temple, and the illustrious Lord Chancellor Bacon, who has devoted to it one of the longest and most agreeable of his Essays. This department of the art has not yet been much studied among us; but as wealth and population increase, it will gradually attract more attention, and will cover the banks of our beautiful streams and lakes, the southern slopes of our hills, and the promontories and islands along our coast, with ornamented grounds. Notwithstanding the comparative sterility of the soil, there are few regions better fitted for this purpose, by varieties in the surface of the landscape, the abundance of water, and the frequently wild and picturesque beauty of the scenery, than New-England. Lake Champlain, —Lake Winnepiseogee, with the neighboring White Hills,—the charming valley of the Connecticut, and a thousand other hills and streams of less celebrity, but not inferior beauty,—the islands south of the Cape, and in our own harbor,—all present the most attractive natural situations, and only require the magical touches of art, to be converted into scenes, as elegant as any that grace the most cultivated regions of Europe, or bloom perennially in the pages of the poets.

In this, as in all the other arts, the progress of taste has been slow and gradual. It is a striking proof of the simple state of Horticulture in the time of Homer, that, in describing the gardens of Alcinous, King of Phœacia, a prince to whom he has given a palace with brazen walls and silver columns;—describing them, too, with so much latitude of imagination, that he has enriched them with the gift of perpetual spring;—he can still imagine nothing more magnificent than an enclosure of four acres devoted exclusively to fruit.

Four acres was the allotted space of ground,
Fenced with a green enclosure all around;
Tall thriving trees confessed the fruitful mould,
The reddening apple ripens into gold.
Here the blue fig with luscious juice o'erflows;
With deeper red the full pomegranate glows;
The branch here bends beneath the weighty pear,
And verdant olives flourish round the year;
Beds of all various kinds, forever green,
In beauteous order terminate the scene.

It is curious to compare with this simple scene, the superb decorations of Paradise by Milton, who found, in his own correct natural taste, a guide which the practice of the art was, in his time, far from affording:

— the crisped brooks,

Rolling on orient pearl and sands of gold,
With mazy error under pendant shades
Ran nectar, visiting each plant, and fed
Flowers worthy of Paradise, which not nice Art
In beds and curious knots, but Nature boon
Poured forth profuse on hill, and dale, and plain.

It was long, however, before the art reached in practice the point of correct taste indicated by this fine passage. Among the Romans, and in modern times, until a very recent period, the prevailing taste was for grounds ornamented in a formal and fantastic way. Pliny, who was one of the wealthiest and most distinguished, as well as most accomplished persons of his time, has given in his works a description of two of his villas, which appear to have been ornamented very nearly in the same way with the Dutch and French gardens of the time of Lewis XIV. They were laid out in regular walks, adorned with artificial flowers and basins, statues, obelisks, and evergreens, cut into fantastic shapes. In the time of Lewis XIV. this was the taste which prevailed throughout Europe and extended even into England. But the better spirits, as we have seen from the passage in Milton, foresaw, by the instinctive light of their own good taste, the improvement that occurred shortly after. Pope, in one of his Moral Essays, finely ridicules the style of the day, and predicts that its tasteless creations would soon be restored to a more natural condition.

The time shall come that sees the golden ear
Embrown the waste or nod on the parterre;
Dark forests cover what your pride has planned,
And laughing Ceres re-assert the land.

The most beautiful work which was produced under the influence of this formal style, was undoubtedly VERSAILLES, the residence of the remarkable sovereign who gave his name to the age when it prevailed. The palace at Versailles was constructed by Lewis XIV. when at the height of his power, without regard to expense; and the gardens, though arranged in accordance with the taste of the day, correspond with the magnificence of the master. The principal ornaments were the artificial fountains. The water for the supply of them was brought several miles in an aqueduct from the Seine, where it was raised by a cumbersome piece of machinery, which, at the time when it was erected, was celebrated as a wonder of art, under the name of the *Machine of Marly*. A steam-engine has recently been substituted for it. The fountains are annually played on the festival day of St. Lewis, which is the 24th of August, and the whole population of Paris goes out to witness the spectacle, which is certainly very magnificent.

During the latter part of the life of Lewis XIV. Versailles was his favorite abode, and its groves and walks were thronged by the nobles and beauties of the most brilliant court ever known in Europe. It continued to be the residence of the royal family until the memorable days of the 5th and 6th of October, 1790, when the populace of Paris took the palace by storm, and, after slaughtering the guard, penetrated to the Queen's bed-chamber, and carried off the family in triumph to the capital. It was here that Burke had seen the same unhappy Princess, only a few years before, on her first appearance at court, as the Dauphiness, "glittering

like the morning star, full of life, and splendor, and joy." While the place was under her direction she added to the embellishments a small garden laid out in imitation of a Swiss dairy. Since the fatal days of October Versailles has been abandoned as a residence, and the gardens have been in some degree neglected. I saw them for the first time at the hour of sunrise, on a fine May morning, in the year 1812. The palace of Lewis XIV. was then a ruin; the last of his successors had perished on the scaffold; his sceptre had passed into the hands of a Corsican adventurer, who was ruling the greater part of Europe with a rod of iron, under the name of the Emperor Napoleon. The very bones of the Bourbon family had been torn from their consecrated resting-place, by the mad rage of an infuriate mob, and scattered to the four winds of heaven. Ten years after, when I saw Versailles again, the scene had already changed. The Bourbons again inhabited the palace, and possessed the power of their ancestors. The Emperor Napoleon had fallen from his high estate, and, under the name of General Bonaparte, expired, in exile and misery, on a burning rock in a distant ocean. His remains, in turn, had been denied a resting-place in the land which he had so long governed. Ten years more have produced another change in the actors and decorations of the great drama. Another hand now wields the sceptre of Lewis, Napoleon, and Charles X.; and another family of royal exiles are wandering in beggary through all the courts of Europe. In the mean time the gardens of Versailles have annually bloomed as freshly as before, and the nightingales that frequent them have sung as gaily as if nothing had happened. These violent and sudden changes in the political world, contrasted with the steadiness and order that distinguish the course of nature, may serve, perhaps, to recommend to us as our chief pursuits and pleasures those that consist in the study of her works and the enjoyment of her beauties.

When Lewis XIV. was at the height of his power he made it a part of his magnificence,—as his successor, Napoleon, afterwards did,—to place one of his family upon the throne of Spain. Philip V. after establishing himself in his new kingdom, was ambitious to imitate the splendor of the royal residences of that which he had left, and undertook to create a new Versailles, on the summit of the Guadarrama mountain, at the distance of about sixty miles from Madrid and at the height of three thousand six hundred feet above the level of the sea. This freak of fancy cost the Spanish people forty millions of dollars, and produced, as its result, the palace and gardens of La Granja, or, as they are often called, from the name of the neighboring village, St. Ildefonso. Notwithstanding the enormous expense at which they were constructed, there is little in the architecture of the buildings, or the general appearance of the place, to remind one of the splendid residence of the old French court; but the gardens, and especially the fountains, are considered by many as even superior to those of Versailles. They are situated on the declivity of the mountain, and are abundantly supplied with pure and pellucid water from the springs above them. One of them, called the Fountain of Fame, throws up a stream of water to

the height of a hundred and thirty feet, the upper part of which may be seen from the city of Segovia at six miles distance.

Such was the state of Horticulture, as applied to the disposition of grounds and gardens, in the time of Louis XIV. A better taste soon after grew up in England, and spread itself thence over all parts of Europe. The improvement lay in substituting a more free and direct imitation of nature, for the formal arrangements and fantastic decorations that were in use before. Most of the grounds and gardens that have been laid out in Europe within the last half century, have been disposed upon this plan, of which very beautiful specimens are to be found, not only in England, France, and Germany, but in Sweden, Poland, Austria, and Russia. The Wood at the Hague, an enclosure of about a mile in length, and half a mile in width, is justly considered as one of the most remarkable of the number.

Of the grounds, ornamented in the purer taste of the present day, that have fallen under my observation, those of the royal residence of ARANJUEZ, in Spain, are, however, the most beautiful. This is the place where the Court usually repair to pass the months of May and June, and it seems to realize, as nearly as fact can be supposed to approach to romance, the description of the Happy Valley in Rasselas. It is situated about thirty miles from Madrid, at the confluence of the noble river Tagus, which is here of very moderate size, with one of its smaller branches, called the Jarama. The country in this part of Spain, though not barren, is destitute of wood, and wears, through the greater part of the year, a parched and dry appearance. After passing over several miles of this monotonous landscape, you descend into an extensive valley of six or eight miles in length and two or three in breadth, covered with the most luxuriant vegetation, and laid out entirely in ground and gardens; in the midst of which are embosomed the buildings that form the royal residence and the neighboring village. The two divisions, of which ornamented grounds are naturally composed, that is, a flower and fruit garden, and a park tastefully planted and disposed, are here combined in high perfection. In the immediate neighborhood of the Palace, are two gardens devoted chiefly to flowers, planted with alleys of elms, sycamores, cypresses, acacias, and various other sorts of ornamental trees, which, in this rich and well-watered soil, grow luxuriantly, and rise, in some cases, to a very great height. The rest of the valley is laid out into open lawns, intersected by roads and variegated by clumps of trees, which occasionally thicken into a sort of forest, particularly at the point where the junction of the rivers presents a scene, similar in kind, and probably not inferior in beauty, to the celebrated Meeting of the Waters in the Vale of Avoca, in Ireland. From this point, the Tagus proceeds with an increased volume of water, and, after washing, a few miles below, the base of the lofty precipitous rock, which forms the site of the old Gothic capitol of Toledo, pursues its course of about four hundred miles to the ocean.

During my residence in Spain, a bold adventurer set forth in a steam-boat from Aranjuez, for the purpose of exploring the river from that place to its mouth. It was the first time that a steam-boat had ever been seen upon its waters, at least, in the interior of the Peninsula. The enterprise occupied about two months; regular bulletins of its progress were published in the newspapers, and

it was evidently regarded as a matter of some national importance. Compare this state of the internal communications in a kingdom that has been occupied ever since the earliest dawn of history, with the hundred and fifty magnificent steam-boats that are now regularly employed upon the Ohio and Mississippi, and you have at least one remarkable fact,—whatever objections may be urged against them,—in favor of the influence of liberal political institutions. [To be continued.]

COMMUNICATIONS.

NEW IMPORTED PRODUCTS.

Lin. Bot. Garden, Flushing, Feb. 4, 1832.

T. G. FESSENDEN—Dear Sir, We send you a description of some of the new Agricultural and Horticultural products recently imported by us, extracted from Loudon's Magazine.

The Hopetown Oat attains a greater height than any other cultivated variety; while, from the nature of the straw, it is not prone to lodge, and is much relished by cattle. It ripens early, yields fine grain, which is not apt to be shed by the wind, and so congenial are the habits of the plant to a dry soil and climate that an experienced farmer compared the Potato and Hopetown Oats growing under such circumstances in the same field, to a young person in the last stage of consumption, and one of the same age in rude health. Thus the Hopetown variety combines in itself all the valuable properties of the Oat tribe, and seems admirably calculated either for the sun scorched plains of the south, or the moist cattle-rearing districts of the west and north.

Taylor's Forty-fold, or Crimson Nonsuch Potato. The former name is given them in consequence of their yielding forty times the weight of the quantity planted, each planting, which they have annually done for the last three seasons. They are beautifully white and uncommonly mealy, and are in perfection for use from the beginning of July to January.

Oxalis crenata, a culinary vegetable. "This plant is cultivated abundantly in the gardens about Lima as a salad, for which purpose its succulent stems and acid flavor seem strongly to recommend it. It grows freely in our open borders, is readily increased by cutting as well as by its tubers which require to be taken up and preserved from frost in the manner potatoes are. The tubers are produced in considerable plenty, and are often two inches long, and an inch in diameter. When raw they are slightly sub-acid; but on being boiled they lose this acidity entirely, and taste very much like the potato, for which they might form an agreeable substitute at the tables of the curious."

The following additional details, the result of further experiments, are from the pen of James Mitchell, Esq. under date of January 10th, 1833:

"I was one of a party where some tubers of this plant were cooked, by boiling for ten minutes; and they were on trial, declared by all present to be more agreeable in their flavor than the common potato. It is not possible to give an idea of the flavor in words; but if I were to attempt it, I should say it was that of the potato slightly combined with the chestnut. I have been informed that the tuber of the *Oxalis crenata* was brought from South America by Mr. David Douglas, and was planted in 1831, by Mr. Lambert. One of the tubers obtained from Mr. Lambert was planted by Mr. Hirst in a pot in the green-house, in the

end of April last, and in the month of May the pot was removed to the flower-garden, and broken, and the parts removed. It was first planted in the green-house as a security against frost; but this appears to have been unnecessary, as the plant has stood the frost remarkably well, and the leaves on the 5th instant, before the tubers were dug up, were quite green. The tuber planted was less than an ounce in weight, and the tubers produced were more than ninety in number, and weighed altogether upwards of 4 lbs. They were in a space the diameter of which was nine inches and the depth six. The stems were between twenty and thirty in number, succulent, and of a reddish color. The flowers appeared in August and consisted of five petals, crenate at the edge, and of a yellow color. The leaves are trifoliate, the leaflets are inversely heart-shaped.

"The experiment of cultivating this tuber may be considered as hitherto very successful, and when we consider that the common potato was long confined to gardens, producing roots which were exceedingly small, and was far less promising than the *Oxalis crenata* at present appears, we may reasonably anticipate that it may prove a valuable addition to our culinary vegetables, and that by skilful management the tubers may be greatly increased in size."

McEwan's Early Cabbage. This variety of Cabbage is earlier by 14 days than any kind known in Europe. After being cut the stalks should be allowed to remain in the ground, and they will produce from four to six heads, which will be fit for cutting by the time the Early York arrives at perfection.

We trust the acquisition of these desirable seeds and roots may be useful to the country at large.

Your most obt.

WM. PRINCE & SONS.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS.

Saturday, Feb. 15th, 1834.

By Mr. Samuel Hyde, Newton, the Hubbardston Nonsuch apple; and two sorts, names unknown, the scions of one of which was received from Detroit.

By E. Bartlett, Esq. the Lady apple (*Pomme d'Api*), and the Nonsuch, a valuable winter apple, origin unknown, different from the apple of the same name cultivated in England.

By Messrs. Winships, the Gardner Sweeting. Scions of the Wilbur Pear were received, taken from the original tree, by M. H. Ruggles, Esq. Fall River, to whom the thanks of the Society were given, and were distributed among the members of the Society.

Saturday, Feb. 22d, 1834.

By Messrs. Winships, Snow apple; and one sort, name unknown.

By Mr. Pope, of Quincy, Golden or Minot's Russet.

By Dr. Shurtleff, Green Sweeting, a valuable productive winter apple, keeps till May.

By R. Manning, Ortleigh apple, (*Woolman's Long Pippin*); and the Beurre of Bollwiller, this pear requires further proof, before it can be recommended for cultivation.

By E. Phinney, Esq. sweet winter apples, from Mr. Samuel D. Davenport of Hopkinton, and the Easter Beurre Pear of the Pomological Magazine,

(Bergamotte de Penticote of the French and Flemings,) an excellent winter pear.

By Mr. John Rupp, of Boston, Sweetwater grapes, in a good state of preservation. Mr. Rupp's method of preserving his grapes will be seen by his letter published below.

The Committee by R. MANNING.

To the Fruit Committee of the Massachusetts Horticultural Society.

GENTLEMEN, I send you a few Grapes which I have preserved through the winter thus far. On opening them, this morning, I find but few that are decayed, and those mostly of the larger bunches. They were put into a pine box, packed in kiln dried mahogany saw dust, so that no two bunches should touch each other, and the box made perfectly air tight. Thinking this might be of some service to those who would wish to try the experiment, I have taken the liberty to send you this sample, which you will please to accept.

Respectfully yours, JOHN RUPP.

Boston, Feb. 22, 1834.

EXHIBITION OF FLOWERS.

Horticultural Hall, Feb. 22, 1834.

By S. Walker, Roxbury, *Primula Acculis*, Oakley's Prince Regent.

JONA. WINSHIP, Ch.

PRODUCTS OF THE KITCHEN GARDEN.

The Committee of the Massachusetts Horticultural Society on the products of the kitchen garden, make the following report, and award the following premiums, to Mr. Daniel Chandler of Lexington, for the two best bunches of Asparagus,

| | |
|--|------|
| To Mr. Thomas Mason, of Charlestown, for the best pair of forced Cucumbers, | 4 00 |
| To Mr. Nathaniel Davenport of Milton, for one peck of peas, the earliest and best, | 4 00 |
| Also to Mr. Nathaniel Davenport of Milton, for one peck of peas, having regard to the quality and yield, | 4 00 |
| To Mr. Samuel Pond, of Cambridge, for one peck of the earliest and best potatoes, | 4 00 |
| To Mr. Nathaniel Davenport, of Milton, for one peck of superior Beans, | 2 00 |
| To Mr. Richard Ward, of Boston, for the best Lima Beans, | 3 00 |

J. B. RUSSELL.

From the Genesee Farmer.

MANAGEMENT OF LIGHT SOILS.

In a former communication, I treated of the management of clay soils, and in this I shall confine my remarks chiefly to those of which sand and gravel are the principal component parts.

The best soils are generally of a dark color, with a due proportion of sand, calcareous earth and clay; and it is the business of the farmer, and happily in his power, by judicious management, to preserve its fertility, or if either of those ingredients be in too large or too small a proportion, in some measure to correct the evil.

In the management of clay soils, the great object should be to render them more friable; but in the treatment of soils not sufficiently adhesive, the efforts of the farmer should be directed to rendering them more so. This is to be attained

by the application of clay, marl, leached ashes or swamp mud, and by ploughing when the ground is wet.

It is often found that sandy soils rest on clay, so near the surface, that deep ploughing will bring up some of it. Where this is the case, the farmer may gain two benefits by one operation. Two inches of clay turned up and mixed with surface soil, will be equal to a dressing of manure, and every inch gained in depth, furnishes so much additional room for the roots of plants to search for food. If, however, clay is not within reach of the plough, the skilful farmer will find a substitute in the scouring of ditches or some of the substances above named. Green crops ploughed in have been found very great improvers of such soils.

In the management of light soils, I should not recommend fall or winter ploughing, unless it be with a view to destroy worms, for the operation of frost is most certainly to destroy tenacity; but I would recommend ploughing deep in all soils.

It is ascertained that a due proportion of lime in the soil is essential to the production of good wheat, and where this is lacking, the enlightened farmer will endeavor to ascertain whether the deficiency can be supplied without an expense disproportioned to the benefits. In Norfolk, England, and in Pennsylvania, lime has been found very beneficial on sandy soils. In Western New-York, where it can be obtained at a reasonable price, it would be worth while to make the experiment on a small scale.

ONTARIO.

From Goodsell's Farmer.

BEES.

Wheatland, January 20, 1834.

MR. EDITOR, In July last I gave you an account of the experiment I was making with my bees, by introducing them into my garret. At that time I informed you that they had not only filled the hive, in which the swarm was placed, for the purpose of removing them into the garret, but had made large combs without the hive.

The bees continued to work well from the time I made my communication to you, (which was dated 29th of July, and published in your fifth number), until interrupted by cold weather. After the weather had become too cold for the bees to collect honey, they left the comb which they had built without the hive, and congregated themselves within, leaving the honey quite unprotected. In December I took from without the hive, twenty pounds of the *whitest honey I ever saw*, and have no doubt, but next season, the bees will furnish three times that amount, of equal quality, as the quantity of bees have increased astonishingly without manifesting any disposition to swarm.

Thus far I am much pleased with the success of my experiment, of which I hope to give you some further account, another season.

I am sir, yours respectfully,

RAWSON HARMON.

SHEEP STORY.

DURING a severe snow storm which occurred about the 1st of Jan. a gentleman missing his flock of sheep, after considerable search found them all save one, completely covered in a snow bank. Great search was made for the lost sheep, but it could not be found. Eighteen days after the flock had been dug out, numerous fox tracks attracted the attention of the gentleman, the tracing of which

led to her discovery. The foxes having found the sheep, it is probable visited her several times; but finding her alive did not meddle with her. The sheep was taken alive, and, says our correspondent, is doing well.—*Newport, N. H. Spectator.*

BUFFON

—It is said, always rose with the sun; he often used to tell by what means he had accustomed himself to rise early. "In my youth," says he, "I was very fond of sleep, it robbed me of a great deal of my time; but, my poor Joseph (a domestic servant) was of great service in enabling me to overcome it. I promised to give him a crown every time that he should make me get up at six. Next morning he did not fail to awake and torment me, but he only received abuse from me. The next day after he did the same with no better success; and I was obliged at noon to confess that I had lost my time. I told him that he did not know how to manage his business; that he ought to think of the crown and not of my threats. The day following he employed force; I begged for indulgence; I bade him begone; I stormed, but Joseph persisted. I was therefore obliged to comply, and he was rewarded every day for the abuse which he suffered at the moment that I awoke, by thanks, accompanied with a crown, which he received in about an hour after. Yes, I am indebted to poor Joseph for ten or a dozen volumes of my works."

From the Greenfield Mercury.

LARGE COLTS.

THE following notice of four colts of uncommon size and beauty, raised by Mr. Samuel G. Green of Bernardston, is offered as an example of what may be accomplished by judicious management, in the perfection and value of domestic animals.

These colts were foaled in successive seasons from the same dam. One of them a gelding, weighed at the age of seventeen months 856 pounds and was sold for one hundred dollars. He soon after changed hands for \$200, and again for \$225. This animal is at present owned by a gentleman in Goshen in this State who has refused \$500 for him. He is three years old this spring.

The weight of another of these colts, a mare, at 14½ months was 777 pounds; at 17 months 890. She will be two years old next grass, and was recently sold to Messrs. Pierce of Greenfield for about \$125. Her form and appearance are extremely good.

The four animals were sold by Mr. G. at an average age of 13 months, for the sum of \$297, or at an average price of about \$75. Few farmers, it is believed, have been to a similar extent so successful, or realized more profit in rearing these noble animals than Mr. G.

AN OBSERVER.

Recipe for Scarlet Fever.—A very simple remedy says a correspondent, for this dreadful disorder, is now using in this city with good effect. It is merely a mixture of Cayenne pepper, salt and vinegar, used as a gargle.

N. Y. Commercial Advertiser.

The Lynn Tribune recommends shoemaker's wax as an excellent remedy for the rheumatism. Put two or three pieces, about the size of the thumb, on the hollow of the foot, and the cure is certain.

From the British Farmer's Magazine.

POTATOES.

On the Cultivation of the Potato, with a view to obtaining greatly increased Crops; by the Author of "the Domestic Gardener's Manual."

Above two hundred and forty years have elapsed since the introduction of the potato into the British Isles. During that period it has been gradually making its way in the favor of the inhabitants; but its progress for a long time was very limited. So slight, indeed, was the estimation in which it was held, even after the era of the revolution, that we find the celebrated Evelyn, in the year 1699, giving directions to plant potatoes in the worst grounds. "Take them up," he says, "in November, for winter spending—there will enough remain for a stock, though they be ever so exactly gathered."

The potato began, however, to be extensively cultivated about the middle of the last century; and now it is grown in every farm and cottage garden, almost without exception.

If experience seemed to have proved, beyond a doubt, that this root may be deemed one of the most important vegetable productions; if, in the face of every assertion to the contrary, it be found a very valuable, and, generally speaking, a most salubrious article* of diet; and admirably adapted to supply nutritious food for animals and poultry; it becomes a serious interest to determine, with certainty, that mode of culture which shall at all times, and in all situations, tend to produce the heaviest crops, and of the finest quality.

The common mode of planting and cultivating the potato is known to every cottager and farming man; but that philosophic method which has recently been productive of enormous returns, may, perhaps, be referred chiefly, if not entirely, to the scientific President of the Horticultural Society. This method it is my object to describe, through the medium of your pages; but before I enter upon the detail of Mr. Knight's directions, I think it a duty to request the reader's attention to a few important results, the particulars of which have been stated to me in letters lately received from that gentleman. As facts, and very recent ones, they are peculiarly interesting, not only as they decisively show what may be, and has been effected during the late season, but also, because they prove, to a demonstration, that science and hypothesis may go hand in hand with practice; and that, when the latter is founded upon the former, it loses altogether its empirical character, and becomes established upon the most unassailable basis.

Mr. Knight has observed, that he planted his potatoes upon a soil *naturally poor*, and very shallow, upon a rock full of fissures, *giving no more manure than is usually given to a crop of turnips*; the manure was mixed up with the soil, and not thrown into the drills at the time of planting. The plants suffered from drought during a part of the year; nevertheless, he had very good crops from many varieties. These varieties he had himself

originated from seed, and they possess the important quality of *scarcely producing any blossoms*; and, therefore, the vital powers of the plant are entirely employed in the production and support of those tuberous processes—the potatoes—which are the sole object of the cultivator. The produce of two of the sorts is particularly stated to me, and is as follows: of the one, twenty-three tons, two hundred weight, seventy-six pounds; and the other, twenty tons, two hundred weight, one hundred and one pounds, per acre. Of four other varieties he observes, "the produce exceeded twenty tons each per acre, all of good quality." If the reader will reduce these weights to pounds, he will find them, (reckoning the yield at twenty tons only per acre) to amount to five hundred and sixty bushels, each of eighty pounds weight.

In the winter of 1831, I received a packet from Mr. Knight, inclosing several specimen potatoes raised by him. For the convenience of carriage, these were under the medium size, weighing about four ounces each; they were, however, perfect in form and growth. Eight of them were selected, and planted in a row, each widely apart one from the other. From these eight tubers, whose total weight was barely two pounds, I obtained a produce of one hundred and fifty-six potatoes, weighing, in all, sixty-nine pounds. Some roots yielded more than others; one was peculiarly prolific—it furnished eighteen pounds of potatoes, six of the largest of which weighed ten pounds.

Having thus adduced a few general facts it remains to point out the mode of operation by which such large results may be obtained.

One of the chief, if not the primary, agent in effecting vegetable development and maturity, is light. Deprive a plant of *that*, and you either paralyze the operation of its vital principle, or induce imperfect and diseased action. The leaves of vegetables are the media upon which light acts; and, therefore, it should be the object of the gardener so to arrange his crops, that the utmost breadth of their foliage may be exposed to the full influence of the solar rays. Hence, the rows of potatoes ought to *point north and south*; for, in the first place, plants so exposed, command the greatest breadth and duration of light;—and in the second, the sun at the time of his highest meridian altitude—that is, at the hour of noon,—shines directly along the extent of the rows; his light is also most equally distributed upon the whole foliage as he approaches to, and recedes from the meridian. The perpendicularity of growth, which is of considerable importance to the complete success of the crop, is less likely to be disturbed by this mode of arrangement, than by any other that has heretofore been employed. It is generally the practice to plant small potatoes, or sets of large tubers, cut with one or two eyes to each. These sets are planted in rows from sixteen to twenty inches asunder, and the sets about half that distance, or nine inches apart, without any consideration being had to the aspect or direction of the rows. As the stems advance in growth they are very liable to fall over, and become entangled one with another, thus intercepting the solar light, which then acts unequally upon the disorderly masses of foliage. Hence the crops become very unequal in point of bulk and weight.

Mr. Knight's philosophical directions lead to a very different result. He recommends the planting of whole potatoes, and those only which are of fine medium size—none to be of less weight

than four ounces; and he often prefers those which weigh six or eight ounces. The earlier sorts, and, indeed, all which seldom attain a greater height than two feet, are to be planted about four or five inches apart in the rows, centre from centre, the crown ends upward; the rows to be from two feet six inches to three feet asunder. The late potatoes, which produce a haulm above three feet in height, are to be placed five or six inches apart, centre from centre, in rows four or five feet asunder.

When potatoes are thus planted in rows pointing north and south, the utmost energy of the light will be exerted, not only upon the foliage of the plant, but upon the surface of the intervening spaces of ground. If we suppose that the main crops will be planted at the latter end of March, and during the month of April, the sun's meridional altitude will be advancing daily, for at least nine weeks; and during that period, the development and growth of the stem and leaves will be in a state of rapid progress. After the turn of days, and when the plants have attained their full growth, the sun will continue to exert its most powerful influence. Should the ground be of a proper texture and quality, the plants will stand erect, and the maturing process will proceed without interruption; and after favorable summers, wherein there have been regular and moderate supplies of rain,—particularly during May and June; with a prevalence, however, of bright sunshine, the crops of potatoes will be regular, the tubers generally of a medium size, and the quality mealy, and altogether superior. If the soil be a strong mellow loam, enriched with much manure, the haulm will, in all probability, grow too rank, and finally fall over; nevertheless, the large spaces between the rows will greatly remedy this evil, for the sun's beams will act upon one surface at the least, and the matting and other injurious consequences resulting from close drilling will be prevented or obviated. I cannot refrain, in this place, from correcting an erroneous opinion, which almost universally prevails. We hear every where of potato plants running away to haulm, and thus expending their vital energy upon useless stem and foliage, instead of employing it in the production of tuberous roots. Now this remark is wholly opposed to philosophical fact, for invariably the strongest and heaviest bulk of potatoes is found attached to the most luxuriant haulm. The evil of over luxuriance is not to be referred to the paucity of tuberous product, for that is always great; it is a consequence of an over-rich soil, which causes the haulm to grow so tall as to fall over, become entangled, and thus to lose the maturing influence of light; hence, such haulm seldom ripens in due time, it remains green even in December; and the tubers, though large, numerous and heavy, are immature, void of mealiness, and vapid in flavor.

A fact of great importance to the growers of potatoes remains to be noticed. The *outside rows*, and all *single rows*, will be found to produce far greater crops than any of the interior rows of a plot in the garden or field. This depends upon a variety of causes, the chief of which is, the more perfect exposure of the foliage to the agency of air and light. Mr. Knight assures me, that he obtained from one outside row of an early seedling variety of the preceding year, which was two feet six inches exterior of an adjoining row, "a produce equivalent to more than fifty-eight tons per acre."

* It has been argued that the potato, at least under certain conditions, possesses a slightly poisonous quality. The idea may have originated in the botanic character of the plant; in fact, it is one of the family of the night shade—the *solanum tuberosum* of Linnaeus, and of the old natural order *luridae*, which included plants whose appearance was described as being "dusky, dismal, and gloomy." The genus or family *solanum*, is the type of that numerous tribe or order in the natural system, *solanaceae*, many of whose members exhibit great beauty of appearance, and possess very useful properties.

No conclusions," he adds, "can be drawn from the amount of produce of an external row. I mention it only to show the enormous influence of light."

In this philosophical remark I cordially acquiesce, because experience has established its truth to my own satisfaction. I therefore earnestly recommend every cultivator who has the opportunity of cropping upon long detached slips, in airy, open situations, to make the experiment of close planting in single rows, either whole potatoes, or well cut sets from very large potatoes, each to contain two eyes at the least. These sets should be taken from the crown end, or middle of the tuber, and not from the lower or root end; as I have found the latter to be comparatively unproductive. Sets may be planted at still less distances in the rows than whole tubers; and although the preference ought in all cases to be given to a southern direction, where such can be conveniently given, still, for absolutely single rows, it is not indispensably required, because air and light will act on each side of the stem and foliage, and there will be no intervening shadow.

The soil ought to be sandy and light, though moderately rich; that is, if fine mealy and dry potatoes be required. It should not by any means be glutted with manure, and need not be deep. I have found no particular advantage in trenching for this crop; in fact, I am credibly informed by an observant gentleman, who has travelled extensively, that in North-America, the finest potatoes are produced in extraordinary quantities upon grass meadows, by simply turning up the turf by placing the grass surface downward upon them.

With respect to the properties of this vegetable, and the purposes to which it may be applied, the following observations of an eminent physician may not be deemed inappropriate. I extract them from the "Pharmacologia" of Dr. Pare:—

"Potatoes are found to produce

First—Cottony flax from the stalk.

Second—Sugar from the root.

Third—Potass by consumption.

Fourth—Vinegar from the apples.

Fifth—Soap, or a substitute for bleaching, from the tubercles.

And finally—when cooked by steam, the most farinaceous and economical of all vegetable food."

It is also known that much farina, or rather *amylum*, or starch, is yielded by grinding and washing the pulpy mass. My experiments in 1828 led me to ascertain, that a fine mealy sort yielded from one-eighth to one-seventh of the total weight of the potatoes. This starch may be employed as a substitute for that made from wheat; and as an article of diet, prepared as Indian arrow root. It can also be introduced in making bread, though there is some difficulty in the manipulation. As food for all cattle of the farm—horses, cows, pigs, and likewise for poultry—potatoes are all but invaluable. Every creature appears to relish them; particularly when they are steamed or carefully boiled. It would be well worth the intelligent farmer's while to pay great attention to the use and effects of potatoes, raw and boiled. It is asserted that a cow may safely eat them in a raw state to the extent of, perhaps, fifty pounds per day, provided the eyes have broken and began to shoot. Whenever they be given raw, however, they should be chopped into pieces to prevent accidents. The utility of raw potatoes is, however, doubted by many, and, therefore, the experiment

requires close observation; perhaps straw, hay, and chaff, might be employed as a very proper adjunct, with a few ounces of salt, added to each feed. Whenever steaming in the large way can be profitably employed, it must be an advantage for pigs and poultry particularly; and in all cases it would greatly tend to prevent the possibility of the danger of suffocation, which has been known to result from the hurry and greediness with which cattle devour the raw roots.

I am, Sir,

yours, respectfully,

G. I. T.

From the Genesee Farmer.

INDIAN CORN.

ALONG the valley of the Mohawk, two varieties of the yellow corn are principally cultivated; the one a lightish yellow corn with twelve rows of kernels upon a cob, and the other a bright and deeper yellow, with only eight rows. In conversing with a very intelligent agriculturist in the city of Schenectady, I learned a fact, which has not before come within my own observation, though it may possibly be familiar to some of your readers.

It has been customary for a long period, for the Dutch settlers on the Mohawk to cultivate the twelve rowed corn, believing that as the ears were larger, and contained one third more kernels, the aggregate yield must be proportionately large.—The Yankees, on the contrary, have rather inclined to the eight rowed. The intrinsic value of these two kinds have been frequently tested, and the result has proved the eight rowed corn to be the most valuable, though it is hard to make a superficial observer believe it.

Two bushels of twelve rowed ears when shelled will yield only one bushel of corn, and frequently will fall a little short. Two bushels of the same length ears of eight rowed, will yield generally a bushel and three or four quarts of shelled corn.—The reason of this is, that although there is one third more kernels on the twelve rowed ear, yet the cob of the eight rowed is so much smaller and the kernel so much larger, the quantity of shelled corn is considerably in favor of the eight rowed.—Another circumstance in favor of the eight rowed corn is, that there is generally two ears on each stock, while upon the twelve rowed, there is rarely more than one; so that on an acre of ground, the number of bushels of ears will be rather in favor of the eight rowed, though the ears are less in size. The eight rowed corn also comes to maturity about a fortnight sooner than the twelve rowed, which is a desirable quality, especially in a cold or short season.

It is an attested fact, though farmers do not seem to practise upon it, that it is necessary to adapt the different varieties of seed to the soil, as it is the breed of cattle or sheep. One description of corn is better suited to a particular soil, than another; and so of grain. Most farmers know that the different varieties of wheat will yield more or less as they are cultivated upon different soils. It seems, then, that in the selection of seed corn for yield and profit, a careful attention should be paid to its nutritive quality; to its adaptedness to your soil; to the size and weight of the kernel, and the size of the cob; to the number of ears usually reared upon a stock; and to the early maturity of the plant.

It seems to me that sufficient attention has not

been bestowed upon this subject, as there is doubtless as much difference in the yield of the different varieties of corn, as there is in any other grain or fruit.

From the Farmer's Register.

TREATMENT OF YOUNG TURKEYS.

THE principal remedy necessary in the first instance appears to be a stimulant, to counteract the extreme feebleness which attends young turkeys, more than other fowls, in the earliest stages of their existence; hence, a grain of pepper, &c. is usually administered as soon as hatched. But instinct, their infallible guide, it appears, has more successfully directed them to the wild onion, which is proved to be a powerful restorative to their natures, and in fact, a grand panacea to the race. When they are permitted to ramble, you will see them busily cropping the green blades of the onion, with much apparent enjoyment.

Small hominy made wet, with the addition of a portion of the wild onion chopped fine, or any other onion tops that can be procured, affords the best and most wholesome food they can have for several weeks at least, or so long as they are confined to small enclosures.

Last spring, I witnessed with astonishment the wonderful efficacy of this article of food on a large flock of turkeys, which had been daily and rapidly diminishing during the long rainy season in May. The mortality ceased the first day after their change of food to the above mixture of hominy and onions; and in two or three days, their rapid growth and improvement was visible to every eye.

Turkeys are very fond of green food of any kind, particularly lettuce and cabbage, and by the time they have grown off pretty well on the onions, there is plenty of that sort of provision. Cabbage leaves, chopped and prepared in the following manner, may then be given them twice a day with good effect, morning and evening.

After the leaves are chopped, put them in tubs of water, to remain all night, and early in the morning spread the meal on boards before them: in the same way, prepare that for the evening, by times in the morning. Continue also to feed them on hominy, so long as they may require your care, and I venture to say that the good housewife, without uncommon accidents, will have no reason to complain of the want of a good dish, whilst turkey is in season.

With my best wishes for the prosperity of your valuable exertions in behalf of the general welfare.

I remain yours, respectfully, HASSINA.

From Goodsell's Farmer.

PRESERVING GRAPES.

WE have been presented with some fine clusters of American Grapes, from the garden of L. B. Laugworthy, Esq. Mr. L. in order to test the keeping qualities of the different varieties packed them in jars, with well dried saw-dust, late last fall, and allowed them to remain in that situation until the past week, when they were opened. The tender European grapes, as the Chasselas and others had decayed; some of the American varieties had lost much of their flavor, but the Catawba was in fine perfection, another quality to recommend this as one of the most valuable for cultivation in this latitude.—In a few years we think the Catawba and Isabella will be the only American grapes cultivated in Western New York, being equally hardy, more productive, and producing fruit with more good qualities than any other varieties.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, FEB. 26, 1834.

INDIAN CORN.

Not only our friend Gorham Parsons, Esq. [whose communication we gave page 246 of our current volume], but several other very respectable cultivators have requested information relative to the methods of culture practised by those who have raised extraordinary crops of Indian corn. We shall, therefore, briefly state, so far as our means of information will permit, the difference between the course of culture pursued, by those who are accounted our best farmers, and those, who by dint of what may be called the "*New Husbandry*" have succeeded in obtaining the prodigious crops, which seem to set our competition at defiance, and almost to destroy emulation by depriving competitors of the hope of equal success.

Mr. Parsons asks "what besides good, deep, and frequent ploughing, manuring in the hole with a large shovel full of good manure, or dividing the quantity of manure, spreading and ploughing in one half, weeding early, ashing the corn at the two first weedings, and half hilling and hilling at the two last hoeings, first selecting the best of seed corn, and the kernels, five in number, placed carefully, forming a square, each kernel four inches apart, and one in the centre, is required to obtain one hundred bushels to the acre?" This is a very good epitome of the *old style* of cultivating corn.—We will give brief notices of some of the requisites of the new modes of making the most of that plant.

And 1st. *The Soil and its Preparation.*

This should be a light loam, made very rich, by animal or vegetable manure, or both. Green sward well covered with long manure, completely inverted with the plough, harrowed and rolled, so as to lie flat, but not ploughed deep, are said to be requisite for large crops of corn. Ploughed in the fall if inclining to clay, in the spring if light and sandy, but at any rate do not disturb the sod, nor bring any part of it to the surface, at least till after your corn crop is harvested.

2d. *Seed and its Preparation.*

We believe it has not been ascertained what kind of corn is generally most productive. From some experiments made by Mr. E. F. Woodward, of Newton, Mass. it appears that of three sorts, which he measured and shelled, the heaviest grain and the lightest cob was obtained from a "yellow corn of 12 rows" on an ear.* Further inquiries and experiments on this subject are very desirable.

It has been often stated that great advantage has been derived from selecting seed corn from stalks, which had borne two or more ears. An article republished in the N. E. Farmer, vol. x. p. 134, from the Hampshire Gazette, mentions a farmer, "who has selected his seed corn in this way for three years past, and the result has exceeded his expectation. He states that it is not uncommon to find in his cornfield stalks with three, four, five, and sometimes six ears, and three of them fair, full grown, and fit for seed, and that too in hills containing four or five stalks. He says, I think my crop has been increased several bushels this year, by the experiment. I would suggest a

mode of selecting seed to those who do not cut up corn by the roots. When they are picking corn, and find a stalk with two or more ears, let them tie the husks together, and the ears will be easily known at husking." This mode of selecting seed, roots, &c. to propagate from, was, we believe, first introduced by Mr. Benjamin Cooper, of Camden, N. J.*

With regard to preparing the seed corn for planting, the recipes are numerous, and too well known to require recapitulation, when addressing a scientific and experienced cultivator. Some, steepers are used for fertilizing, some to preserve against worms, and some for both purposes. The preparation used by Judge Buel may be found, N. E. Farmer, vol. xi. p. 306. A writer for Goodsell's Genesee Farmer, with the signature W. J. W. recommends wetting seed corn with soft soap, and rolling it in plaster; and gives the details of an experiment, which proved the utility of this preparation. The benefits derived from soaking seed corn in a solution of copperas have been often stated by writers for the N. E. Farmer. Mr. J. Ellsworth gave us a very satisfactory article on that subject, published in the N. E. Farmer, vol. x. p. 331.

3d. *Manner of Planting.*

The principal improvement in raising this crop, introduced by modern husbandry, consists, we believe, in substituting drills of one, two or three rows for the usual mode of planting in hills, by which a greater crop is obtained, though the expense of culture is undoubtedly increased. This cannot be better explained than by quoting from an excellent article written by Judge Buel, of Albany, originally published in the *Genesee Farmer*, and republished in the N. E. Farmer, vol. xi. p. 305.

"The following table exhibits the difference in product of various methods of planting, and serves also to explain the manner in which large crops of this grain have been obtained. I have assumed in the estimate that each stock produces one ear of corn, and that the ears average one gill of shelled grain. Thus estimating the product low, for while I am penning this (October), I find that my largest ears give two gills, and 100 fair ears half a bushel of shelled corn. The calculation is also predicated on the supposition that there is no deficiency in the number of stocks, a contingency pretty sure on my method of planting.†

stalks. bush. qts.
43,560 170 5

"The fifth mode" Judge Buel states "I have tried. The ground was highly manured, the crop twice cleaned, and the entire acre gathered and weighed accurately the same day. The product in ears was 103 bushels, each 84 lbs. net, and 65 lbs. over. The last bushel was shelled and measured, which showed a product on the acre of 118 bushels, 10 quarts.—I gathered at the rate of more than 100 bushels to the acre from four rods planted in the third method last summer—the results ascertained in the most accurate manner. Corn shrinks about 20 per cent. after it is cribbed. The 6th mode is the one by which the Messrs. Pratts of Madison county, obtained the prodigious crop of 170 bushels per acre. These gentlemen, I am told, are of opinion that the product of an acre may be increased to 200 bushels.

"The writer also observed, I am told the Messrs. Pratts, above alluded to, used seven bushels of seed to the acre, the plants being subsequently reduced to the requisite number."

From the above and other authorities, it appears that the requisites for obtaining more than 100 bushels of corn to an acre are a proper soil, a grass sward, well manured, ploughed but once, fairly inverted, harrowed and rolled,—seed from stalks producing more than one ear, prepared by steeping in some liquid which fertilizes and preserves it from worms, planted in the right season, in drills, as above described, and well hoed, without much hilling. It is likewise advised to have the rows or drills run north and south, thus giving the plants a more advantageous exposure to the rays of the sun.

MYRTLE WAX.

A gentleman, who writes to the editor from Baltimore wishes to know how the wax obtained from the Myrtle-shrub *Myrica Cerifera* can be bleached? We have no knowledge on this subject derived either from observation or experience, but find the following directions for bleaching *Bees Wax* in a collection of Receipts, which we have generally found to be correct.

Melt your wax, and while hot throw it into cold water to reduce it into little bits, or spread it out into very thin leaves, and lay it out to the air, night and day, on linen cloths, then melt it over again, and expose it as before: repeat this till the sun and dew have bleached it; then, for the last time, melt it in a kettle, and cast it with a ladle on a table covered over with little round hollows in the form of the cakes sold by the apothecaries; but first wet your moulds with cold water, that the wax be the easier got out; lastly, lay them out in the air for two days and two nights, to make it more transparent and drier.

Although these directions are for bleaching *bees-wax*, they may, perhaps, answer for *myrtle-wax*.

A REPLY to the remarks of H. C. on Mr. Sheldon's communication relative to cutting hay for cattle, will probably be published in our next.

ITEMS OF INTELLIGENCE.

MEADVILLE, Pa. Feb. 14, 1834.—*Melancholy.* On Monday evening last, the clothes of a little girl aged 5 years, daughter of Mr. Orwan, of Evansburg, in this county, took fire in the absence of its parents. The child ran out, but before it received assistance, was burned

* See N. E. Farmer, vol. 10, p. 331.

to such a degree, as to cause its death at eleven o'clock the next morning—affording another warning to parents, of the danger attending the clothing of children with cotton garments during the winter, which will have about as much effect as the hundreds which have preceded it.

In the French Chamber of Deputies, M. d'Argenson, and M. du Puyraveau, had declared "that the symbol of their faith is no longer a constitutional royalty, that their law is the republican code, that the declaration of the *société des droits de l'homme* is their gospel, and that Robespierre is their hero." A declaration which naturally has excited much astonishment and called for observation from all the journals.—In other respects we find nothing in the domestic concerns of France deserving particular notice.—*N. Y. Courier & Enq.*

SPLENDID FLOWER SEEDS.

200 to 300 Varieties of splendid Annual, Biennial, and Perennial Flower Seeds in papers of 6 cents each, 50 Varieties for \$1.00.

Packages of the following 20 kinds at \$1.
Beautiful Clarkea; Crimson Cypress Vine; Mixt Balsams; Dwarf Convolvulus; Mountain Fringe; Purple Sweet Sultan; Sensitive Plant; Double Dwarf Rocket Larkspur; Blue Camellia; Gillyflower; Grand Flowering Argemone; Wall Flower; African Hibiscus; Purple Candytuft; White E. Primrose; Scarlet Tassel Flower; Ice Plant; Variegated Euphorbia; White Chrysanthemum; Golden Eternal Flower.

—Also—Packages containing—
Convolvulus Minor; Golden Corcoris; White Candytuft; Great flowering Larkspur; Mixt Asters; Blue Canterbury Bells; Grand flowering Hibiscus; Mixt Morning Glory; Double Carnation Poppy; Evening Primrose; Sweet Alyssum; Tri-Colored Chrysanthemum; Scorzenera; Mignonette, fragrant; African Rose, 100 sorts in one; Superb Fringed Pink; Cockscomb; English Catchfly; Brilliant Rudbeckia; Yellow Chrysanthemum.

The above were raised by one of the first Florists in the country, and are for sale at the New England Seed Store Nos. 51 and 52 North Market St. Boston.

G. C. BARRETT.

GRAPE VINES AND EARLY POTATOES.

Catawba and Isabella Grape Vines, extra large size, by the hundred or single.

Early Potatoes which obtained the premium for the last five years. For sale by SAMUEL POND, Cambridgeport, Feb. 26.

VALUABLE COUNTRY RESIDENCE FOR SALE.

Situated in Roxbury, near the late Doctor Porter's Meeting-house, consisting of about 3 acres of land, with a pleasant and convenient Dwelling House, Stable, and other out-houses—has also on it from 100 to 150 young and choice fruit trees, with a great variety of grape vines, shrubbery, &c.—Is within fifteen minutes' ride of State-street, and from its particular location is both very central, and at the same time as much retired as many places five and eight miles from the city. It has running through it or on its borders a delightful stream, and is every way one of the pleasantest situations in the vicinity. For terms and price, which will be liberal, apply to

LUKE BALDWIN,

Feb. 25 8, Merchants Row.

MILK FARM, &c. . . . TO BE LET.

A valuable Farm in Medford, about five miles from this city, comprising between 80 and 90 acres of the best of mowing, tillage, and pasturing land, with a great variety of the best of Fall and Winter Fruit; sufficient security will be required. The Farm will be let on a lease from three to five years; for further particulars please apply to N. H. BISHOP, Medford, Feb. 19, 1834.

EARLIEST DWARF PEAS.

50 BUSHELS of the Earliest Dwarf Peas, being the earliest variety, having grown for eating in 38 days from time of planting, grows 20 to 24 inches high. This will be found an acquisition for a very early and good variety.

Raised expressly for, and for sale at

G. C. BARRETT'S

New-England Seed Store.

TEA SPRING WHEAT.

25 BUSHELS of this valuable variety of SPRING WHEAT, of which a trial of three years has proved it to be a productive kind, not liable to blast or mildew. For sale at

G. C. BARRETT'S Seed Store.

WANTED,

An Assistant Gardener, who can produce good recommendations. Apply at this office. f19

MASSACHUSETTS HORTICULTURAL SOCIETY.

A stated meeting of this Society, will be held at their Hall, 81 Cornhill, (lately Market Street) on Saturday next, at 10 o'clock.

R. T. PAINE, Rec'g. Sec'y.

FARM FOR SALE.

Situated in the South Parish in Andover, little more than half a mile southwesterly from Phillips' Academy and the Theological Institution, and about one mile from the Rev. Mr. Badger's Meeting-house,—containing about forty acres of valuable land, being the choice part of a much larger farm—having thereon one large and convenient two story dwelling-house, finished and in good repair, lately occupied as a boarding-house.—Also, near it, a one story dwelling-house in good repair. Also a barn ninety feet long, sheds, wash-house, wells of excellent water, gardens, fruit trees, &c.—A very eligible situation for any person desirous of retiring into a pleasant country town for the purpose of educating his children. The above valuable estate will be sold at public auction on Tuesday the first day of April next, at 3 o'clock P. M. Conditions of sale liberal.

SAMUEL FARRAR.

Andover, Feb. 24, 1824.

REDUCTION IN PRICES OF TREES, &c.

WM. PRINCE & SONS have determined in consequence of the pecuniary pressure, to reduce the prices of a great variety of Trees and Plants, where orders are sent for a considerable amount: and all persons who desire Fruit and Ornamental Trees; Flowering Shrubs and Plants; Greenhouse Trees and Plants; Splendid Dahlias; or Seeds—will on applying to them direct by mail, with a list of the articles wanted, be promptly furnished with a printed sheet explaining the reduced rates.—The Chinese Mulberry, or *Morus multicaulis* are now reduced to \$25 per 100, and \$4½ per dozen.—Apple trees in great variety \$20 to \$25 per 100.—Pears \$37½ per 100, and extra large ditto 50 cents each; and 50,000 are two, three, and four years grafted.—Peaches \$20 and 25 per 100.—Large Orange Quinces \$30 per 100.—English and Spanish Filberts \$25 per 100.—Fine Red Raspberries 36 per 100.—Large Red and Yellow Antwerp \$16 per 100.—Gooseberries, finest Lancashire varieties \$20 per 100; and Large Red, White and Black English Currants \$16 per 100.—Isabella Grape, 3 years old vines \$25 per 100, and 2 years ditto \$20 per 100.—Catawba, Alexander, Winne, York Claret, York Madeira, and Scuppernon, \$25 per 100.—Herbmont's Madeira, Troy and Elmsburgh, \$30 per 100.—Norton's Virginia Seedling \$35 per 100.—The collection of choice European Grapes is unrivalled.—Chinese Ailanthus, 4 feet high, \$½ per dozen and larger sizes in proportion.—A reduction is made on a great many kinds of Roses, Poonies, Chrysanthemums, &c.—Double Dahlias of such fine assorted kinds as have been most increased, will be supplied at \$3, \$4, and \$6 per dozen, according to excellence, and selected by ourselves. The roots can be sent to any distance.—The new varieties of Flemish and English Pears having been introduced by us and greatly increased, the prices of the greater part have been reduced, and the trees are mostly of fine size and three years grafted.—The Ornamental Trees and Shrubs of most kinds are large and thrifty, and of double or treble the value of smaller ones, which is a most decided advantage, being a gain of several years in embellishment.

N. B. Having no Agent at Boston, the Commission of 10 per cent. usually allowed for Agency, will be credited to the purchasers, and be deducted from the amount of the bills rendered. The stock of Dahlias being so very large, they will be furnished on the most favorable terms possible.

Linnean Botanic Garden and Nurseries, {

Fishing, near New-York, Feb. 10, 1834. }

BRIGHTON NURSERIES.

MESSRS. WINSHIP have the pleasure of announcing to the public, that a part of their importation of new and rare productions to this country have arrived, among which are the following new and leading kinds of Scotch Gooseberries, and are now ready for delivery—they can be securely packed for this or any other country, and forwarded at the lowest Catalogue prices,—with a liberal discount by the hundred—viz.

Reds. Roaring Lion, Lancashire Lad, Jubilee, Jolly miner, Emperor, Nonsuch, Ringleader, Prince Regent.

Yellows. Yello de Paris, Nelson's Waves, Fine bobbin, Hood, Combeneer, Waterloo, Cottage Girl, Black-mith, Suffolk, Green. Ocean, Favorite, Evergreen, No bribery, Fairy, Green grove.

Whites. Queen Ann, Smiling beauty, Vittoria, Glory, Conquering hero, Queen Caroline, Washam lass, Noble lady.

Also, at the proper season for removing hardy plants, the most extensive varieties of FRUIT, ORNAMENTAL and FANCY productions, that are cultivated in this country; all of them well acclimated; consequently, in the estimation of most persons better adapted to endure the severity of our climate, than those imported from more southern and milder temperature.

Orders may be left with GEO. C. BARRETT, Agent, 52 North Market-street, Boston, or forwarded to Messrs. WINSHIP, Brighton, Mass. by mail or otherwise.

Catalogues for gratuitous distribution at the N. E. Farmer Office and Seed Store of Geo. C. Barrett. f19

BRIGHTON MARKET.—MONDAY, FEB. 24, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 514 Beef Cattle, and 188 Sheep, divided as follows:

At BRIGHTON—414 Beef Cattle and 183 Sheep.—(Including 20 Beef Cattle and 38 Sheep unsold last week.) 104 Beef Cattle unsold.

At CAMBRIDGE—100 Beef Cattle, all of which have been before reported. 43 Beef Cattle unsold, all of which will probably be slaughtered in all the week. 26 Beef Cattle were left a few miles back for next week, and are not reported above.

PRICES. Beef Cattle.—'Dull, dull' the market is completely 'gladd' we do not recollect ever witnessing so bad a Market-day. Cattle generally were sold from 33 to 50c per hundred less than they cost the drover on the 'Conventual valley.' We noticed two yoke only taken at \$5 75.—We quote prime at \$5 a 5 50; good at 4 50 a 5; then at 4 42½.

Sheep.—A lot very fine were taken at 4 67, and a lot at 3 50 a 3 67.

Swine—None at market.

MISCELLANY.

THE HERMIT.

TIME from his features long had worn away
The rust of earth, and Passion's gloomy frown;
He would not stoop to grasp a falling crown;
Nor bend, the sceptre of the world to sway!
Free from the vain desires that earth enthral;
Free from vain terrors that mankind appal;
Untouch'd by Hope, and unassail'd by Fear,
To Truth alone he turn'd his mental ear;
Alone to Nature tun'd, and her sweet, simple call!

TRUTH IS POWER.

SOME men say that 'wealth is power,' and some say that 'talent is power,' and some that 'knowledge is power;' but there is an apothegm that I would place high above them all, when I would assert that 'truth is power.' Wealth cannot purchase, talent cannot refute; knowledge cannot overreach; authority cannot silence her;—they all, like Felix, tremble at her presence. Fling her into the most tremendous billows of popular commotion; cast her into the seven-fold heated furnace of a Tyrant's wrath, she mounts aloft as the ark upon the summit of the deluge; she walks with the Son of God, untouched by the conflagration.—She is the ministering spirit who sheds on man that bright and indestructible principle of life, light and glory, which is given by his Mighty Author to animate, illuminate, and inspire the immortal soul, and which like himself, 'is the same yesterday, to-day and forever.' When the mould has long been heaped on the pride of wealth, and talent, and knowledge and authority; when earth, and heaven itself shall have passed away, truth shall rise, like the angel of Manoh's sacrifice, upon the flame of nature's funeral pyre, and ascend to her source, her heaven, and her home—the bosom of the holy and eternal God.

PERSEVERANCE REWARDED.

THE Emma, of Harwich, George Grant, master, employed in conveying the Post-office mails, on her outward voyage to Gottenburg, fell in, on the Dogger Bank, with a large Finland vessel, laden with timber, for London, bottom upwards, upon which was a man, who had just made his way through the bottom of the vessel. It appears that the vessel suddenly upset in a gale of wind, and seven of the crew in the fore part, were drowned; four others, in the cabin, were driven through a small hatchway in the floor. Here, without food and in darkness, they remained for four days and nights. Providentially, they found an old spike nail and a ballast stone; these proved to be the means of their deliverance, for, with great presence of mind and ingenuity, they sharpened the nail, and with this miserable, yet in their circumstances invaluable, tool, "hoping almost against hope," they began to pick away the planks and timber of the vessel's bottom over head; and after toiling day and night, they succeeded in making an outlet through a timber fourteen feet by twelve inches, and the plank three and a half inches thick, whence, with a stick and a slip torn from a shirt, they made their feeble signal of distress. At length, by perseverance, the opening was made large enough to admit of the whole of their number getting through, which they had not long effected before they were all fortunately rescued by the Emma.—*Edinburgh Ev. Cour.*

THE plainer the dress, with greater lustre does beauty appear. Virtue is the greatest ornament, and good sense the best equipage.

EARTHQUAKE.

On the 5th inst. at 20 minutes past 10 o'clock, P. M. a heavy shock of an earthquake was felt in this city. It was preceded and followed by a loud rumbling noise and a very perceptible tremor; and at the instant of the shock a strong report was heard, resembling that of a powerful explosion. Its duration was scarcely longer than ten or twelve seconds; but it was probably the most violent shock ever experienced in this part of the country.—*Lancaster Ezr.*

COAL MINES.

THE anthracite coal mines of Pennsylvania may be classed among the wonders of the world; for there are here whole mountain-tops covered with carbon. Scarcely a thin turf presses upon the silvery masses of the coal on some of the tracts, where it is dug or quarried in the open air, under the blue vault of heaven, instead of being excavated from mines beneath the dark vaults of overhanging dripping rocks. The rays of the sun, and not the miner's glimmering lamp, afford light to the laborers. One of the mountains near the river Lehigh, which I visited in the autumn of the year 1830, appeared to be covered with a crust of coal varying in thickness from ten to forty feet. From only one small tract of less than twenty acres had this crust of coal been removed to the bare rock, forming the substratum, leaving a chasm of the depth of the thickness of the vein, surrounded by perpendicular cliffs of the pure untouched coal, which glittered in the sunbeams like magic walls of polished jet. The superstratum of turf and soil, and the fragments of rocks which form the superficial coat, are removed from above the upper surface of the mass of coal by railway wagons, which descend a few hundred yards to the brow of the mountain, from whence their loads are shot forth, to fall several hundred feet, with a noise resounding amid the surrounding silent forest like the crash of thunder.

The empty wagons are drawn back to the summit of the mountain by the toilsome labor of mules, who descend again, however, without effort in their little moveable stables or pens, mounted on wheels. The conductor stated that these animals have become so habituated to riding down that they will evince their mulish disposition when deprived of expected pleasure, and will endeavor to step into their pens and to lie down, rather than to budge on foot to the bottom of the mountain.—They actually appear to take vast satisfaction in their ride, with their ears erect and long faces peering gravely out at the sides, like passengers in a stage coach, to enjoy the prospect. The spectacle of a number of mules, thus transposed from the usual station in the harness, to the dignified situation of inside passengers, travelling with greater speed than that of a mail coach, produces an effect so truly ludicrous as inevitably to produce a smile.

The agent calculates sanguinely that three or four hundred thousand tons of coal per annum may be furnished from these coal quarries.

Pottsville, situated in an adjacent valley, is a considerable town, entirely built up within five years by the profuse expenditures made for the construction of railroads and canals, and for the purchase of the lands containing coal.—*Practical Tourist.*

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Fir, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

NO. 34.

AN ADDRESS BEFORE THE MASSACHUSETTS HORTICULTURAL SOCIETY;

At their Fifth Annual Festival, September 18, 1833.

BY ALEXANDER H. EVERETT.

PUBLISHED BY REQUEST OF THE SOCIETY.

(Concluded from p. 258.)

III. THE grounds and gardens, to which I have alluded, have been laid out chiefly for the private recreation of their owners; but the art of Horticulture is applied to higher and more interesting objects. At Athens, the public gardens were employed by the principal philosophers, as schools, or places of instruction. One of them, called *Academy*, or, as it is modernized in English, *the Academy*, was frequented by Plato; and in consequence of the great celebrity and influence which have since been acquired by the doctrines originally taught there, has given its name to a great variety of literary and scientific institutions. The original Academy was nothing more than a public garden, laid out by the distinguished Athenian General, Cymon, and planted chiefly with olive-trees, of which there are many still growing on the spot. The place was situated without the walls of Athens, and near the spot appropriated to the sepulchres of distinguished men. At the entrance was an altar, dedicated to Love, and within were altars to Minerva and the Muses. The tomb of Plato was in the immediate neighborhood. The Lyceum was another Athenian garden of the same description, which was celebrated as the school of Aristotle, and, like the Academy, has given its name, in modern times, to innumerable institutions for education and improvement.

The art of embellishing grounds and gardens, has, also, been occasionally applied, both in ancient and modern times, to the still more solemn and interesting purpose of preparing repositories for the remains of the dead. The cemeteries of the Eastern nations are commonly situated without the walls of their cities, tastefully planted with trees, and frequented as public walks. The cemetery of Pere la Chaise at Paris is of the same description; and there is a beautiful one, of a similar kind, though on a smaller scale, at New-Haven, in Connecticut. It is much to be desired, that repositories of this description may be multiplied among us. While they tend to promote the salubrity of cities, they connect agreeable images with the recollections of the past, and the anticipations of the future; and strip the idea of death of a part of the horrors, with which superstition and the weakness of our nature, have unnecessarily invested it.

In connection with this branch of the subject, I would venture to remark, that it has often occurred to me as a desirable thing, that some public funeral ground of this description should be consecrated to the memory of the patriots and heroes of the Revolution. The spot most suitable for this purpose would be MOUNT VERNON, a territory well adapted to it by its central situation in the Union, its vicinity to the Seat of Government, its natural picturesque beauties, and its noble position upon the banks of one of the finest rivers in the world; but especially fitted for the object above all other grounds, from having been the residence of Wash-

ington. It seems to be a sort of profanation, that the dwelling, which was rendered sacred to the view of the American people by having been the scene of his earthly pilgrimage, should be afterwards devoted to the ordinary purposes of life; and without intending any reflection upon the conduct of the present occupant, whose leisure and privacy are as sacred as those of any other individual, it is certainly a painful thing, that the people should not be permitted, at all times and seasons, to pay their vows in perfect freedom at the tomb of their political father. It is evident that they can never enjoy this advantage in its full extent, while the place is held as individual property. Some restrictions must be imposed upon the freedom of access; and the disagreeable scenes, which, from time to time, will necessarily occur, in consequence of this, without furnishing a proper occasion for censure upon any one, should, if possible, be avoided in regard to all matters connected in any way with the memory of the great genius of the spot.

It is, therefore, desirable, on every account, that Mount Vernon should be purchased by the people, and held as a national property. The sacrifice, that would be necessary in order to acquire it, is too trifling to be mentioned; and although the family of Washington must, of course, set a high value on his patrimonial domain, they would naturally be proud and happy to cede it for the honorable purpose of being consecrated as a perpetual monumental ground to the memory of the Revolutionary fathers of the country. The house and grounds should be kept in perfect order, and, as nearly as possible, in the condition in which they were left by Washington. On some elevated spot should be erected an equestrian statue of the hero, that might catch from a distance the view of citizens as they ascended the river to visit the place, and might serve as an indication to them that they had reached the end of their journey. This imposing figure, towering majestically above the clumps of trees that adorn the grounds, would form a noble object as seen from a distance. Every ship that passed, would strike her top-sails in honor of it, as the mariners of Athens, when they entered the Piræus on their return voyages, were accustomed to salute the tomb of Themistocles, which stood at the bottom of that harbor.

Within the house might be placed the portraits of the great proprietor and of his associates in civil and military life. In the principal hall should stand his own by Stuart, with that of his aid and confidential friend General Hamilton on one side, and on the other, that of Lafayette by Scheffer, which now hangs in the Rotunda of the Capitol. After these would naturally follow those of Lee, Gates, Morgan, Sumpter, and the others. Warren, the young martyr of Bunker-Hill, should hold a conspicuous place, and the hero of Bennington should not be omitted. Another principal room should be devoted to the commemoration of those who served the country in civil life. At the head of these, should be stationed Franklin, John Adams, and Jefferson, with the members of the Continental Congress grouped around them. In their company should appear the others, whose services were most conspicuous in the earlier scenes that

preceded the decisive action. There should be seen the open face and manly person of Samuel Adams, as represented by Copley. By the side of this, our more than Cato, might stand Patrick Henry, our untaught Demosthenes, John Dickinson, the lettered farmer, and Otis,—a name endeared to the citizens of Boston by the patriotic virtues and charming eloquence of more than one generation. In another of the rooms should be collected the younger generation who were associated with Washington in completing the work of the Revolution, by reforming the government and introducing the present Federal constitution. Here should be another portrait of Washington in a civil dress as President, and another of Hamilton on account of his signal services on that occasion. Madison and Jay should accompany the latter on either side; and after them should come the active friends and supporters of the constitution throughout the country;—the cloudy care-worn countenance of Parsons, the radiant visage of Ames, and the fine manly features of Rufus King. With this group the list should close, for it would scarcely be expedient to make Mount Vernon a Westminster Abbey, or general mausoleum of the illustrious dead, but rather to devote it specifically to the honor of the revolutionary worthies and the founders of the government. The merit of these, as respects the country, will always remain of a singular kind, whatever titles of honor may hereafter be won by others. In some more private apartment should be collected the portraits of the family of Washington. This interesting collection would at once furnish the house in a manner suitable to its destination, and concur in promoting the general object. The national flag should be displayed above the building, to mark it as public property, and the estate might, for purposes of jurisdiction, be considered as an appendage to the District of Columbia.

The access to Mount Vernon, under this arrangement, should be perfectly free to every one, at all times and seasons,—effectual measures having been taken to prevent disorder and injury to the property. Under these circumstances, the resort to the place would probably be much greater than it had ever been before; and it would gradually come to be regarded as a sort of sacred ground, like the plains of Elis in ancient Greece, where the Olympic games were celebrated at the end of every four years. Mount Vernon, too, might, perhaps, be made the theatre of public rejoicings on the anniversary of our great national festival. The citizens of the neighborhood would naturally meet there upon that occasion; and, in proportion as the importance of the day shall be more and more felt, and the respect for the memory of our political fathers shall go on increasing, as it will, from year to year, many persons, from all parts of the country, would naturally avail themselves of that opportunity to visit the abode and burial-place of their illustrious leader. The festivities might, probably, be continued for several days, and might be accompanied by devotional and literary exercises, poems, plays, and other entertainments of all descriptions. The whole drama of the Greeks grew out of an annual religious festival, lasting four or five days in succession,—during which, tragedies and come-

dies, founded in the history and manners of their country, were acted, without intermission, from morning till night. We, too, might, perhaps, obtain in this way, a national drama more congenial to the state of manners and of morals among us, than that of modern Europe. Here, too, some new Herodotus might read to his assembled countrymen the yet unwritten history of the achievements of their fathers; some modern Pindar restore the glory of poetry, by devoting it anew to the praise of heroism and virtue. A festival like this, held, perhaps, once in three or four years, would produce no trifling effect in maintaining among the people a high national spirit, and cherishing that principle of PUBLIC VIRTUE which we are taught to regard as the essence of our government.

But, gentlemen, I am trespassing too long upon your patience, with a detail of plans that, perhaps, may never be realized. Whether such a disposition as I have now suggested, will ever be made of the sacred domain of Mount Vernon, will depend upon the wisdom of the General Government. In the mean time you have commenced on the smaller scale, corresponding with the wants and the resources of a single State, an establishment of this description, which promises to become one of the chief ornaments of the neighborhood, and of which the progress, thus far, does great credit to the discernment and taste of your society. Superior in its natural advantages of position to the famous sepulchral grounds of the ancient world, we may venture to hope, unless the sons of the pilgrims shall degenerate from their fathers, that MOUNT AUBURN will hereafter record in its funeral inscriptions, examples not less illustrious than theirs, of public and private virtue. Even now, when the enclosures that surround it are scarcely erected,—while the axe is still busy in disposing the walks that are to traverse its interior,—this consecrated spot has received the remains of more than one, whose memory a grateful people will not willingly permit to die. There was laid, by the gentle ministrations of female friendship, as the first tenant of the place, the learned, devout, and simple-hearted Daughter of the Pilgrims, who has wrought out an honorable name for herself, by commemorating theirs. There reposes in peace, the young Warrior, cut off like a fresh and blooming flower, in the spring of his career. There, too, rests beside them, the generous Stranger, who in his ardent zeal for the welfare of man, had come from a distant continent to share the treasures of his wisdom with an unknown people.* Around their remains will gradually be gathered the best, the fairest, the bravest of the present and of many future generations. In a few short years, we, too, gentlemen, who are now employed in decorating the surface of Mount Auburn or describing its beauties, will sleep in its bosom. How deep the interest that attaches itself to such a spot! How salutary the effect which a visit to its calm and sacred shades, will produce on souls too much agitated by the storms of the world! It was surely fitting that Art and Nature should combine their beauties, to grace a scene devoted to purposes so high and holy.

* The persons alluded to in the text are Miss Hannah Adams, Lieut. Watson, and Dr. Spurzheim.

ITEMS.

A spoonful of horse radish put into a pan of milk, will preserve it sweet for several days.

In one year 65,000,000 of eggs were exported from France to Great Britain.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS.

Saturday, March 1, 1834.

Apples. From Mr. Cheever Newhall, Dorchester, Pippin, Spitzenberg, and oblong Russet; also a very fair apple, name unknown.

From Col. Wilder, Dorchester, Nonsuch, and a highly flavored apple name unknown.

From E. M. Richards, Esq. Dedham, Nonsuch, Seeknotharther, Spitzenberg, and a kind name unknown.

From Mr. Sparhawk, Brighton, the Roxbury Russets in fine order.

From Nathan Webster, Esq. Haverhill, Hodgkins apple, tender and fine flavored.

From William Worthington, Esq. Dorchester, a fine apple name unknown.

For the Committee, B. V. FRENCH.

EXHIBITION OF FLOWERS.

From S. WALKER, Roxbury, Viola alba pl.

From THOS. MASON, Charlestown Vineyard, Chinese tree Pæony inouan Banksii, Acacia longifolia (salicifolia albo), Camellia albo plena, Camellia seedling very fine, Queen Stocks, do. Ten-week.

From M. P. WILDER, Dorchester, Camellia japonica, var. Chandleri, Wiltonia, Clintonia, (grandiflora spatulata), Lindbriata, alba plena, anemone-flora.

From Messrs. WINSHIP, Petunia myctaginiflora, Primula acaulis, sinensis, Erica mediterranean, Erica purpurea, Cyclamen-v-album, Cineraria populifolia, Lachenalia pendula, Teucrium fruticans, Oxalis caprina, Bellis hortensis, Bellis fistulosa, Azalia indica alba, Yellow-Tea rose, Stocks, &c.

The show of flowers will be continued every Saturday, at the Society's new Rooms, No. 79 Cornhill, provided the weather is fair and mild; the splendid display of flowers exhibited this day, induces the Committee respectfully to request every Horticultural amateur to patronise the exhibition, by sending to the rooms on Saturdays between the hours of ten and twelve o'clock in the forenoon, such plants, or flowers, as they may esteem interesting.

By order of the Committee,
JONA. WINSHIP, Chairman.

From the Farmer's Assistant.

CHANGE AND IMPROVEMENT OF SEEDS.

Most plants are found to degenerate to a certain degree, unless their seeds are frequently changed. This has been attributed to their cultivation in climates where they are not indigenous. But this can hardly be the sole reason; for it is found that most plants will be improved, by having the seeds brought from the east to the west, and *vice versa*.

Providence, in making so large a world as this, seems to have designed that there should, nevertheless, be a common acquaintance among the Nations which inhabit it. They are invited abroad, for conveniences which their own climates do not furnish; they are impelled to a general intermixture, from a knowledge that it is beneficial; and the benefits to be derived from a change of seeds, are probably only in furtherance of the general design of a Community among Nations.

But we are yet much in the dark, as it respects the best changes of seeds, and from what parts of

the world they should be brought, to produce the greatest crops. Ought not this to become a matter of more general concern? The Irish Farmers sow our flaxseed, and find great account in it. Would their flaxseed be equally beneficial, when sown here? We have known flaxseed brought from Longisland, and sown in Orange county, which produced nearly double the crop which the common seed there produced. Spring wheat brought from Canada, and sown here (Herkimer county), greatly enhances the crop; but soon degenerates. Siberian wheat yielded largely in this country, for a while. The seeds of apples brought from Europe will produce trees larger than our own. For roots, it is generally supposed that seeds brought from a more southerly climate are best. Indian corn, brought far from that quarter, will be in danger of ripening too late: that brought far from the north will ripen too early for a large crop. On the whole, the Farmer should make his changes as judiciously as possible; and in most instances he will then find the product of his crops greatly increased.

But, in order to prevent seeds from degenerating, by long use, we are of opinion that the plan pursued by Mr. Cooper of New Jersey, will be found effectual; though we believe that seeds, improved according to his plan, would undergo a further improvement, by a suitable change of place.

His method is to make frequent selections of the most perfect plants of every kind, and to cultivate the seeds of these by themselves, for the purpose of raising new and improved stocks of seed of every kind; and further, when he raises seeds of plants, of which there are different species, he is careful to set or plant them as much as one hundred yards from each other, in order that in propagating they should not mix breeds, and thus produce spurious or degenerated seeds, partaking more or less of the qualities of each plant.

Seeds are also sometimes susceptible of improvement, by growing varieties of the same plants together, for the purpose of obtaining seeds of a medium between the two. But we will further illustrate these matters.

Thus, in making selections in wheat, for instance, search for such heads as have the largest seeds, and the greatest number in each head. In Indian corn, of any particular variety, for stalks of good size, with the greatest number of ears on each, and the ears the largest, most perfect of the kind, and best filled. In flax, for the longest stalks, and such as have, at the same time, seeds of good size. In pumpkins, for such stalks as bear the greatest number, and these the largest, and sweetest. In short, in making the selections, take the most perfect and valuable plants to be found, of whatever kind is wanted, and from each of these raise the progeny that is to serve as the stock for seed of the different plants to be cultivated.

In many kinds of plants, such as Indian corn, pumpkins, &c. the selections may be yearly repeated, without any essential inconvenience. In others, such as wheat, barley, &c. yearly selections would be too expensive. In such, let selections be made, say, every eight years; and from the seeds of the plants thus selected raise a yearly stock, sufficient to serve for seed. The more constantly the selections are made, however, the more valuable may the products be expected from such seeds.

In regard to the means just mentioned, for preventing a degeneracy of seeds, by the intermixture of different species of the same plant, we will state

a case. Of the *Brassica* tribe of plants there are different species, and also varieties of two of these, to wit: cabbages of several varieties, common turnips of several, and the cabbage-turnip, or rutabaga, of which there are no varieties. The cabbages are valuable for their heads, or leaves; the common turnip, for its bulbous root; and rutabaga for its bulbous stalk.

Now, if seeds for ruta-baga, and for cabbages, were constantly raised beside each other, the consequence would be, that the bulb of the former would become less, and its foliage more extended; while the head or foliage of the cabbage would lessen, and its stalk become somewhat bulbous: and if all the species and varieties of the plant were constantly grown together, for seed, they would gradually become more assimilated, and the most valuable parts of each, of course, lessened in product.

But sometimes an improvement of seed is to be effected, by growing varieties of the same plant together. Of Potatoes, for instance, there are many varieties, some preferable for one particular quality, and some for another; some for greatness of product, and others for meanness, and fineness of taste; and, in such case, by growing them together, a race is produced which, in part, partakes of the good qualities of each.

The same may be observed of many other plants; and in some instances, perhaps, improvements might be made, by blending the most valuable qualities, of plants of different species, together.

Such, we conceive to be, the doctrine of Mr. Cooper; and we are of opinion that, in general, it is well founded. Mr. C. also contends, and we think with much truth, that there is a natural disposition in all seeds, or plants, gradually to become habituated to the soil, or climate, in which they are grown.

BARLEY.

BARLEY, as a field crop, has been cultivated from time immemorial. It is not known of what country it is a native, nor at what time it was first cultivated. At this time it is much more extensively cultivated in England than it is in this country. Few crops require more care in the cultivation, or are more apt to disappoint the cultivator in all the good wheat growing districts of the United States, than Barley.

There are six species of Barley at present cultivated in England, viz.

Spring or Summer Barley.—There are two varieties of this species, but the one commonly cultivated (*H. vulgare*) may be distinguished from the Siberian Barley by the heads being much larger, and as well as beards arranged in double rows, whereas the other is single, of which the heads appear flat. This is considered the best kind of barley for malting as the husk is light.

Winter Barley.—There are three kinds of winter barley which are at present cultivated for profit, besides two or three species and varieties that are cultivated as matters of curiosity.

The common or long eared Barley.—(*H. distichon*) is perhaps cultivated more than both the other species. Both heads, and awns, or beards, of this kind are much longer than those of other kinds of winter barley. The heads of this kind are flat, and do not appear more than one half their width in thickness.

Square Winter Barley.—The heads of this kind of barley, though not as long as the foregoing, are much thicker, and have the appearance of being square, the grains being arranged in four distinct rows. This is accounted a hardier species than the long eared, and not as subject to be injured by the winter.

Big or Barley big.—This species has large square heads, with grains arranged in six rows and is cultivated on account of its being earlier than the common or square barley. It is not valued so high for malting as either of the other two varieties mentioned.

Soil and Climate.—Barley succeeds best in a cool damp climate, and there upon a fine warm sandy loam; but where the climate is warm, and dry, as in most of New York, a loose soil, rather moist than dry, produces the best crops.

The best crops of Barley grown in the State of New York, are upon a high range of table land on the North side of the Mohawk River near Fairfield. From the elevation of this range of land, it is too cool, to produce either corn, or wheat, unless when the seasons are usually favorable, but it produces barley in great perfection.

In preparing lands for winter Barley, the course taken is the same as in preparing for wheat, and the sowing done in the same manner, but there should be twice as much seed sown upon an acre as of wheat.

Fresh stable manure should never be used upon land to be sown with barley as it will generally be found to do more hurt than good. Lands for Barley should always, where the soil will allow of, be ploughed deep, and after seeding, the process should be finished with the roller. There is not a crop raised where the use of this implement is more important. By examining the plant, it will be seen at once, that it is not well calculated to stand the drought, as the roots are small and do not penetrate deep, and it has a great proportion, of broad, thin foliage.

Summer barley should be sown about the same time as oats, and lands capable of producing good crops of the one, will be found suitable for the other.

From the great quantity of foliage produced by winter barley, when sown early in the fall, in countries where the snows lie deep and long, it is found advantageous to feed it to calves or sheep previous to the setting in of winter, to prevent it from moulding.

Harvest Management.—There is more care required in the management of this than any other crop raised upon a farm. If cut too soon it will be found very difficult to separate the awns, or beards, unless thrashed in a machine; if allowed to stand too long, the ears are apt to break off, at the bend of the straw, near the head. If cut green, and suffered to remain upon the ground, to render the awns brittle, through rain storms, many of the grains will vegetate, which renders them of little worth for malting. Where farmers are provided with thrashing machines, the better way is to allow barley to stand until fully ripe, then cut it with a scythe, and let it remain upon the ground a day or two, if the weather is favorable, then take it directly to the machine, and thrash and clean it.

The quantity of barley, produced per acre, is quite variable. We have sowed good lands, that did not produce more than twelve bushels, and we have seen upon lands, that were no better in

quality, nor better prepared, crops that would average fifty bushels, much depending upon climate for its perfection. In England the average produce is allowed to be about twenty-eight bushels per acre.

From the uncertainty of the crop, barley is cultivated but little for any other purpose but malting for beer. So that the market price will depend upon the distance at which the crop is raised from a brewing establishment.

In some parts of Europe barley is extensively used for making bread, but in this country where in most parts a bushel of wheat may be raised as cheap as a bushel of barley, it is not likely to come into use as an article of food.—*Goodsell's Genesee Farmer.*

CHEMISTRY IN THE KITCHEN.

Why is it necessary to mix lime with ashes, which we are about to leach to obtain ley to make soap? The correct answer to this question will explain the reason why our good housewives do not always succeed in making good soap, and will suggest a remedy for the evil. Common soap is a compound chemically united of potash or alkali, and grease, fat or tallow. The alkali is naturally combined with carbonic acid, for which it has a stronger affinity than it has for grease; hence while it continues united with the acid, it will not unite with the grease, and produce good soap. But lime having a stronger affinity for the acid than the alkali has, extracts it from the ley, and the alkali then readily unites with the grease and forms soap. From this it will be seen, that the lime should be fresh burnt, and spread over the bottom of the leach tub, so that the ley all filters through.—*Gen. Farmer.*

From the Genesee Farmer.

THE BITTER ROT IN APPLES.

The following paragraph is from the letter of a distinguished correspondent.

"A history of the culture of fruit trees since the settlement of this country, is greatly wanted to remove the discouragements that occasionally occur. Some thirty years ago, the *Vandevere*—the queen of culinary apples,—and the *Grey House* that holds the same rank as a cider apple,—were so affected by the Bitter Rot, especially the former, as to render them nearly useless. I have now both varieties, and they have not been for years affected with that disease."

We remember, when the Bitter Rot was so prevalent, to have heard the cause ascribed to the decline of the variety by Old Age, a doctrine to which we have seen no good reasons for subscribing. We have been long satisfied that cultivators, speaking of them as a body, but of course, admitting of many exceptions, have too much theory and too little observation. The facts which we have just presented to our readers must either prove an erroneous ascription, or that Old Age is not an incurable disease; and we think there need not be much hesitation in deciding this point.

We have lately seen it stated that liming the land is a preventive of the Bitter Rot; but to what extent, or with how much precision, the experiments were conducted, we have not been able to learn. We know that our esteemed correspondent considers lime as indispensable in his system of manuring; but we know not if it has been applied to his orchards; and we would now respectfully make the inquiry of him, with a view to its influence on the fruit.

From the Northern Farmer.

MANURES.

MANURES to a Farm are what blood is to the human body. The first object of a farmer should be to obtain, and preserve in the best manner, all the animal, vegetable and compost manures, which can be made upon his farm, or procured elsewhere; but unless properly preserved, much of his labor is wasted, and his lands are less productive.—Fair experiments have clearly proved that the manure of cattle, preserved under cover or in vaults under barns, possesses a third more value at least, than the same kind which has remained exposed to rains and the action of the atmosphere. This will not be doubted by any one who has any correct information upon the subject, or has by experiment ascertained the difference. We cannot well explain the reason of this great difference, without adopting the style and terms of the Chemist; but as our object is not to enlighten the learned, we therefore reject technical terms, and use language more familiar.

Vegetation is caused not so much by the quantity of manure mixed in the soil, as by its nutritious qualities. Should all farmers understand the fact, that none of the earthy or solid parts of manure enters into plants, or, in other words, that it is *only the liquid parts, or that portion of the manure which combines or unites with water, which produces vegetation*, or causes the corn to grow, they would then perceive the necessity of preserving animal manure in vaults, under cover. The only value which the earthy part of the manure has, is to keep the soil into which it is ploughed, in a loose, pulverized state, so as to render it capable of retaining, after rains, a greater quantity of moisture.

Some farmers have expressed an opinion, that the urine of cattle promotes vegetation as much as their manure. But whatever may be the difference in value, it is surely very important that the urine should be preserved in vaults mixed with the manure.

In the spring, when the manure is conveyed into the field, it should be ploughed in immediately, and spread no faster than becomes necessary for ploughing: because at this season, the warmth of the sun produces a rapid fermentation, the most valuable or liquid part of the manure escapes in the form of gas, as it is often expressed, by evaporation.

Should a heap of manure at this season be covered with earth two feet deep, in a short period the whole mass of earth would be enriched by the gas, arising from the fermented manure. Hence the utility of covering fresh barn yard manure with earth, straw, litter, weeds, street and dooryard scrapings, mud from swamps, and all kinds of decomposed vegetable matter. Skilful farmers will always make as large a quantity of compost manure as possible. It is a very certain way to enrich a farm, and ensure abundant crops. If these truths are conceded, then it conclusively follows that the general practice of our farmers in respect to manure is injudicious. They let the manure lie in large yards, or the open field, exposed to heavy rains and the action of the atmosphere. A large portion of the nutritive qualities escapes in gas, or is washed away by the heavy rains. The greater the exposure to the atmosphere the greater the loss. Therefore the practice of carting out the barn yard manure in the Fall, and spreading it in small heaps upon the soil intended for ploughing in the Spring, is still more censurable. But the Fall manure is often carted

into the fields and deposited in one or two large heaps to rot, for the purpose of manuring the corn and potato hills in the spring; and strange as it may seem many old Farmers yet believe that old rotted manure promotes vegetation better than fresh, or unfermented manure! They appear to be ignorant of the fact, that the longer manure remains exposed to rot, the less nutriment, or food for plants it retains; and the more it becomes assimilated to mere earth.

To put either fresh or rotted manure in the hill, in the season of planting potatoes and corn, as a general practice, is injudicious.—But half the quantity of fresh, unfermented manure, in the hill well mixed in the soil, would afford probably more nutriment than double the quantity of old rotted manure.

The moisture, necessary to vegetation, is conveyed to the roots of young trees, or the corn, or other plants, through the medium of earth. If any light or dry material is in contact with the roots, it tends to cut off the regular and natural supply of water, and the plant must either extend its roots through the dry substance to draw its supply of moisture, or else become feeble, and perhaps perish.—Hence, in a dry season, more particularly, manuring in the hill, often proves very injurious to the growth of plants. If manuring the corn hill is ever judicious, it is only on a cold, moist and sterile soil, or swarded land deeply ploughed, where a farmer has not a sufficient quantity of manure to mix in the soil. The surest method to enrich the soil for future years, is to plough in the manure. The roots of corn, extending several feet around the hill, will find whatever nourishment the soil contains; and it is far better to afford a sufficient supply when the corn is coming to maturity, than merely to force the kernel to vegetate a few days earlier by means of a hot-bed.

Our preceding remarks show the importance of covering manure well with earth, previous to its fermentation. Hence the common practice of spreading the manure upon the surface and “harrowing it in,” is attended with great loss, as a large portion will remain dry upon the surface, and for no other use than to enrich the atmosphere.

Manure being the life of a farm, every exertion should be used to procure all kinds of it. Compost, soot, ashes, lime, gypsum, burnt clay or soft bricks pulverized, decomposed vegetable substances, weeds, leaves of trees, coarse grass, &c. &c. will all tend to fertilize the soil. None are ignorant that such as is taken from the vaults, affords the greatest quantity of nutriment to plants. On farms it ought never to be lost. The yards for swine, ought always to be excavated, or be in the form of a basin, so that this manure in richness next to the last, should be preserved in a moist state. The same remark applies to the barn yard for other cattle, except that the latter ought to have a level and dry margin for feeding cattle occasionally.—Soon after planting in the Spring, a farmer ought to commence hauling into these yards the different substances we have enumerated and any others within his reach, which can be converted into manure. These substances will become incorporated with the manure of the cattle, and also absorb their urine, and the whole mass will be less liable to dry up and waste in the summer season.

A good farmer will be careful to yard his cattle at night as much as practicable through the warm, and in the day time, in the winter seasons. It has

been found to be very beneficial to keep the cattle yards in a moist state by means of aqueducts, whenever practicable. In fine, farmers should spare no labor or expense to obtain a plentiful supply of manure to fertilize the soil. Their liberality to “Mother earth” will be repaid with equal abundance.

In England nothing is lost, which can be converted into manures. And some English farmers fertilize their fields, in part, with the pulverized bones of animals; and for this purpose, have even gathered human bones from the plains of Waterloo.

W. CLAGGETT.

Portsmouth, Jan. 16, 1834.

From the Genesee Farmer.

INDIAN CORN.

Meadowbanks, Deerfield, Mass., Jan. 31, 1834.

MR. EDITOR.—I have been an attentive reader of the Genesee Farmer from its commencement, and beg leave to express my respect for the ability, intelligence, and practical utility, with which it has been conducted. I am likewise an ardent admirer of the agriculture of New-York, having visited with peculiar satisfaction, several parts of your noble state, unrivalled for its enterprise and public spirit; having the honor of a partial acquaintance with some of your most eminent cultivators, who are second to none for their inquisitiveness, knowledge, skill, and success in this most important of all arts, and regarding the publications of your societies, and some individuals in your state, as among the most valuable, which have come under my notice.

With these impressions, few things in your paper escape my observation; and my attention was attracted this morning to a communication on Indian Corn, signed Quercus, in the Farmer of the 25th inst. I agree with your intelligent correspondent on the importance of particular attention to the seed we plant, its selection, preservation, and the preparation of it; and to its character for productiveness, adaptation to the soil, and early maturity; but of the relative value of the twelve and eight rowed corn, my experience and observation do not confirm his views.

I have been in the practice for years of planting extensively of the twelve rowed corn, though I have usually planted some of the eight rowed likewise. The twelve rowed corn which I plant, corresponds with his description of the Dutch corn, planted on the Mohawk. I have received seeds from various sources; from Roxbury, under the name of the Golden Sioux; from Brighton, as the Pomroy corn, because S. W. Pomroy, Esq. circulated the seed through the state after the disastrous season of 1816, as a very early corn, almost sure to be ripened, and as husking itself in the field; that is, when ripe the husks fall down and leave the ear exposed, presenting a golden harvest to the delighted eye of the farmer; from Judge Buel, as the Dutton corn from Vermont; from E. Plimney, Esq. of Lexington, Mass., as a corn received by him from Vermont; but though obtained from these different sources, it appears to be of the same kind. Of the eight rowed corn there are many varieties planted in this part of the country; some very large, called here the Dickinson corn, from one ear of which plucked in the field, ripe but not dry, I shelled more than a pint of good corn; a second kind, smaller and earlier ripe, called the Clesson corn; these are merely local names; and a third, still smaller, called the Canadian, which having been planted here several

years has much increased in size from what it was when first introduced. The largest kind of eight rowed corn is a magnificent plant, but of a late maturity; requires very wide planting, and is often allowed from six to eight, and even nine feet by five between the hills. I presume your correspondent does not refer to this kind, and I shall take it for granted from his remarks, that he refers to a middling sized eight rowed corn, which produces an ear from eight to nine inches in length, and a larger kernel than the twelve rowed.

I will then recapitulate in order the grounds on which he gives the preference to the eight rowed corn over the twelve rowed, and subjoin the results of my own observations and experiments.

1. First he says, "Two bushels of twelve rowed ears when shelled, will yield only one bushel of corn, and frequently fall a little short. Two bushels of the same length * ears of eight rowed will yield generally a bushel and three or four quarts of shelled corn."

These positive statements put me upon an inquiry into the actual facts, as far as I had the means of determining them. I have no theory to establish, but am desirous as your correspondent of ascertaining what is true, and consequently determining what is best. I therefore applied to a near neighbor, G. S., a small farmer, but extremely careful in all his operations, and obtained some eight rowed corn, of which he raised as fine a sample as I ever saw, and of a good size, in order to compare it with my own. His corn being planted very early, was in perfect condition; mine planted from three weeks to a month later was ripe, but not so sound as his. His too was saved in small quantity—mine in large.

Half bush. of ears of G. S.'s corn weighed 25 lbs.

do. do. do. do. do. H. C.'s. do. do. do. do. do. 24½ lbs.

This was an uncertain mode of measuring—for though we designed to be exact, yet a few ears might easily have been placed on the one, or not have been placed on the other, and yet both measures have appeared equally heaped to the eye.

When the above was shelled and measured, there was not a difference of half a gill—G. S.'s measuring 1 peck, 3 quarts; H. C.'s measuring 1 peck, 3 quarts, and a fraction.

2. His second position is that, "Although there is one-third more kernels on the twelve rowed, yet the cob of the eight rowed is so much smaller and the kernel so much larger, the quantity of shelled corn is considerably in favor of the eight rowed."

The cob of G. S.'s corn compared with the size of the ear, judging by the eye, was as small as I ever saw. Now the cobs of the above two parcels of corn were weighed, and the result as follows:

G. S.'s cobs weighed 4½ lbs.

H. C.'s. do. do. do. do. do. 4½ lbs.

In order, however, to determine more exactly the relative proportion of the cob to the grain in the two kinds, I selected two of the best ears of each sort, shaved the butt as closely as possible, and having carefully shelled the corn, caused the grain and the cob of the two parcels to be separately weighed in an apothecary's scales. Of the two ears of G. S., one measured in length eight inches and one quarter, the other eight inches one half. Those of H. C. one nine and three quarter

inches, the other ten inches and one half. Of the two ears of G. S.'s eight rowed,

The grain weighed 8½ oz.—the cob 1½ oz.

Of the two ears of H. C.'s twelve rowed,

The grain weighed 13½ oz.—the cob 2½ oz.

In these cases it will be found that the proportion of the cob to the grain is precisely the same, and the comparison was made as exactly as possible.

With a view farther to compare the two kinds, I caused one peck of each kind, shelled, well shaken and struck, to be weighed—the result as follows:

One peck G. S.'s weighed 17 lbs.—68 lbs. per bush.

do. do. H. C.'s. do. do. do. 16½.—65. do. do. do.

This difference would doubtless have been less had the two kinds been equally well ripened and saved. The season was particularly unfavorable to late planted corn, and G. S.'s was extraordinarily sound. In proof, likewise, of the very fine and superior character of his corn over that which is generally raised of the eight rowed, perhaps arising from his early planting and particular attention, I immediately weighed one peck of the corn of two other neighbors, of the eight rowed kind, which had been taken in by a shrewd trader at the highest market price. The measure was hard shaken and struck.

One peck weighed 15½ lbs.—61 lbs. per bushel.

do. do. do. do. do. 14½ do.—57. do. do. do.

With this certainly the twelve rowed would bear not an unfavorable comparison. H. C.

(To be continued.)

From Cobett's Cottage Economy.

DRESS, HOUSEHOLD GOODS, AND FUEL.

In a former paragraph, I said, I think, enough to caution you, (the English laborer,) against the taste now too prevalent, for *fine* and *fimsy* dress. It was, for hundreds of years, amongst the characteristics of the English people, that their taste was, in all matters, for things solid, sound, and good; for the *useful*, and *decent*, the *cleanly* in dress, and not for the *showy*. Let us hope that this may be the taste again; and let us, my friends, fear no troubles, no perils, that may be necessary to produce a return of that taste, accompanied with full bellies and warm backs to the laboring classes.

In *household goods*, the *warm*, the *strong*, the *durable*, ought always to be kept in view. Oak tables, bedsteads and stools, chairs of oak or of yew tree, and never a bit of miserable deal board. Things of this sort ought to last several lifetimes. A laborer ought to inherit from his great grandfather something beside his toil. As to bedding, and other things of that sort, all ought to be good in their nature, of a durable quality, and plain in their color and form. The plates, dishes, mugs, and things of that kind, should be of *peuter* or even of wood. Any thing is better than crockery ware. Bottles to carry a-field should be of wood. Formerly, nobody but the gypsies and mumpers, that went a hop-picking in the season, carried glass or earthen bottles. As to *glass* of any sort, I do not know what business it has in any man's house, unless he be rich enough to live on his means. It pays a tax, in many cases, to the amount of two-thirds of its cost. In short, when a house is once furnished with sufficient goods, there ought to be no renewal of hardly any part of them wanted for half an age, except in case of destruction by fire. Good management in this way leaves the man's

wages to provide an *abundance of good food and good raiment*; and these are the things that make happy families; and these are the things that make a good, kind, sincere, and brave people; not little pamphlets about "loyalty" and "content." A good man will be contented fast enough, if he be fed and clad sufficiently; but if a man be not well fed and clad, he is a base wretch to be contented.

Fuel should be, if possible, provided in summer, or at least some of it. Turf and peat must be got in summer, and some *wood* may. In the woodland countries, the next winter ought to be thought of in *June*, when people hardly know what to do with the fuel wood; and something should, if possible, be saved in the bark harvest to get a part of the fuel for the next winter. Fire is a capital article. To have no fire, or a bad fire, to sit by, is a most dismal thing. In such a state man and wife must be something out of the common way to be in a good humor with each other, to say nothing of colds and other ailments which are the natural consequence of such misery. If we suppose the great Creator to condescend to survey his works in detail, what object can be so pleasing to him as that of the laborer, after his return from the toils of a cold winter day, sitting with his wife and children round a cheerful fire, while the wind whistles in the chimney, and the rain pelts the roof? But, of all God's creation, what is so miserable to behold or to think of, as a wretched, half starved family creeping to their nests of flocks or straw, there to be shivering, till sent forth by the fear of absolutely expiring from want?

THEY WORK IT RIGHT.

Report of Oxford Farmers.—Samuel Garnsey produced about 1800 bushels of potatoes, on three and half acres of old pasture without manure. Twice spring ploughed—twice dragged and ridged—planted on the ridge in the hill, about level with the surface, on the first days of June—hoed out only once, producing 500 bushels to the acre.

Lyman Balcom, reports 650 bushels of potatoes, of flesh red and pink eyed, on one and a half acres of wheat stubble—spring ploughed—seed cut in hills—twice hoed.

Benjamin Butler, 600 bushels Ruta Baga, on one acre of sandy loam, after a crop of clover—once ploughed; 400 bushels of compost manure, spread on the furrow—rolled, harrowed and ridged with a double mould board plough, drilled on the ridge, in the last week in July.—*Farmer's Adv.*

TO PRESERVE BOOKS.

A FEW drops of any perfumed oil will secure libraries from the consuming effects of mould and damp. Russian leather, which is perfumed with the tar of the birch tree, never moulders; and merchants suffer large bales of this leather to remain in the London Docks, knowing that it cannot sustain any injury from damp. This manner of preserving books with perfumed oil, was known to the ancients. The Romans used oil of cedar to preserve valuable MSS. Hence the expression used by Horace—"Digna cedro," meaning any work worthy of being anointed with cedar oil, or, in other words, worthy of being preserved and remembered.—*Greenfield Gazette.*

TO HOP GROWERS.

Hops are sold in New York at 19 and 20 cts. per pound, and are likely to become an article of regular and extensive exportation.

* In measuring corn in the ear by the bushel or basket, I do not see why the length of the ear should be considered.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MARCH 5, 1834.

SPRING WORK.

In making post and rail fence, it is good economy to set the posts with the top part placed in the ground, for some experienced cultivators have assured us that posts in that position will last much longer than would be the case if they stood as they grew. It is likewise advised, in making this sort of fence, to place the rails with the heart side up. In both these cases, it is thought that moisture is less easily imbibed by the pores of the wood than if it was left in a more natural position. It is best to insert the ends of the posts about two feet below the surface of the ground, and to burn those parts in a hot fire till they become quite black, which will cause them to remain sound much longer than they would otherwise.

Finish cutting, splitting and piling your wood. It is best to keep at least one year's stock of fire wood beforehand. Philosophical gentlefolk assure us that dry wood will do twice the service of green wood, and in this they are perhaps about right, at least so far as respects wood to be consumed for cooking.

Your carts, ploughs, harrows, hoes, rakes and other farming implements, should be subjected to a careful review, repaired where necessary, or replaced by new ones, and had in readiness for use. They will last the longer if painted, and covered with some suitable composition. Covering wood repeatedly with oil or grease, will have a tendency to preserve it. Where tools or implements are exposed in the field the greater part of the year, they require to be new painted, at least every other year. This is as useful for iron, as for wood, both of which should be kept coated with paint or oil, so far as is practicable.

You may as well take this opportunity to cut scions for grafting. They should be cut from the extremities of the branches of the last year's growth, of the most thrifty, and best bearing trees, and placed with their lower ends in the ground of some dry cellar till wanted.

Look to your drains and water courses, and contrive to spread over your grounds as much of the wash of the highway, as can be conveniently monopolized. By frequent changing your water courses, you may render your mowing ground even, and prevent one part from growing too rank, and lying down before the other part is fit to be cut.

Procure the very best of garden and other seeds for the ensuing season. If you have not good seeds and good fences, and good breeds of animals, you cannot reasonably expect good crops, will not have a good dairy, and can neither expect the reputation, nor to enjoy the emoluments of a good farmer.

It is almost or altogether time to attend to the commencement of horticultural operations. Carry manure into such places as require it, whenever and wherever frost will permit; but do not spread it till the season is so far advanced, that it can be mixed with, or ploughed under the soil. Provide, if you have not already, a sufficient quantity of bean poles and pea rods, for the purpose of supporting such vegetables as require poles or rods. The length and size of your pea rods should be proportioned to the sorts of peas for which you intend them. The same kinds of rods which the

tall growing peas require, viz. from 6 to 9 feet in length, will answer for the generality of running kidney beans. The Lima and Cuba beans will need strong poles, about 8 or 9 feet long. Rake together, and burn the vines, haulm, and whatever may remain of your last year's crops. Straw mats for the hot beds, rails, lattices or trellices for espalier trees, should now be got in readiness. Clean trees from moss, and protect them from mice and rabbits, by white-washing with lime, or smearing with some composition, which is offensive to those depredators. Attend to forwarding various sorts of seedling plants by artificial means, so that they may be provided with strong roots, and arrive at some size by the time they would naturally make their appearance above ground.

GAMA GRASS.

In answer to many applications for the Gama Grass Seed, we would say, the small parcel received from Mr. Bartlett from Georgia was sent to two of our friends who will try it and give accurate reports of the results of their experiments.

For the New-England Farmer.

PREPARING FOOD FOR CATTLE.

Beverly, March 1, 1834.

MR. FESSENDEN, Dear Sir, I regret as much as your correspondent H. C. that I could not have given the result of my experiment on the subject of chopping and preparing food for cattle, without the necessity of guessing, knowing as I do the importance of exactness in all these experiments. But as an apology for adopting it in this case, I beg leave to offer the following reasons.—Notwithstanding my conviction of there being a saving in chopping and preparing hay, &c. yet I was not aware of the saving being so great, consequently I did not begin with the least idea of publishing the result. If I had, I should have weighed the quantity of hay consumed per day before commencing chopping, and also the quantity after chopping; but as I did not do this, I of course availed myself of the best evidence in my possession, and even now if practicable, I would for the satisfaction of H. C. weigh and ascertain to an ounce. But to every one who has had experience on this subject it must be obvious that in shifting cattle from prepared food to unprepared, they will not devour it so readily nor in so great a quantity for 8 or 10 days, consequently I cannot now make an exact statement, but will here state from proof positive that in the latter case I was very nearly correct, and in the other also I think the variation would be but trifling, if any. Both might overrun from 25 to 50 pounds per day, but the proportion would be the same. But I think a calculation can be made nearly as correctly by measuring, as by weighing, a mow of hay, estimating (when the hay is well stowed and settled) six hundred square feet to make a ton. This rule, I believe to be very nearly correct, and will as often overrun as fall short.

As it respects the queries of H. C. concerning the potatoes, &c. I will here give an account of the whole process. In a central part of my barn I have a room 18 by 12 feet; this is ceiled with boards, which make it tight and warm. In this room is a pump, and a pen 10 by 10 feet, which is made water tight, the hay being chopped and thrown into a heap, outside this room, early in the morning a sufficient quantity is put into this pen to feed the whole stock once, to which is added water enough to moisten it, then meal and po-

tatoes, when the whole is mixed with a four tined fork until every part of the hay receives its proportion of the meal and potatoes, then it is given to the cattle in baskets. This process is followed three times each day, viz. morning, noon, and about sunset. The whole of which is performed, excepting giving it to the cattle, by a man whom I hire for 8 dollars per month, not 3 as stated in your paper. This was done with not the most improved straw cutter; now I have one of Willis's improved straw cutters, the same man can perform the whole, including feeding, and the hay is cut shorter and more uniformly which I think is quite an improvement.

In regard to chopping the potatoes I do not think it is of much consequence, excepting, they are more easily and uniformly distributed amongst the hay which is of some consequence, as when not chopped the cattle will devour the potatoes first, when I think it is better that the whole should be eaten together. In regard to the cause of the difference in the two modes of feeding, if I should venture to give my opinion, it would not be on any particular part of the process but on all its parts collectively; the quantity of meal or roots might be varied; for instance, if potatoes were worth more in the market in proportion to their value for feeding cattle than grain, then reduce the potatoes and increase the grain, and so vice versa; but some meal is indispensable with coarse fodder, as it is not to be supposed that neat cattle throw up and masticate a second time but a small part of the food they devour, consequently much of it passes off without imparting more than half of its nutritious substance, especially when dry, hard hay is given without other food or preparation. I think this is more perceptible in milch cows than in any other cattle; hay given in an unprepared state must of course require so great a portion of moisture to prepare it for digestion that but little is left for milk, consequently the hay devoured is often worth more than the milk we get in return; hence the importance of preparing our winter food for our cattle, and bringing it back as nearly as possible into its natural state when growing in our best pastures, by the most simple, easy and cheapest process.—I now, Mr. Editor, hope that H. C. will accept the very imperfect explanation I have here given, and that he or some other learned gentleman will take up the subject and do it ample justice.

Yours, with respect, AMOS SHELLEN.

ITEMS OF INTELLIGENCE.

A Costly Edifice.—President Jackson has submitted a plan which has in view the erection of a magnificent edifice for the present and future accommodation of all the offices of the Government. He proposes a building facing the President's square, eight hundred feet in length, with a colonnade in front. The estimated expense is about three millions.—*Transcript.*

A storm of the 18th Dec. appears to have been destructive in some parts of Germany. In the forest of Tharanderbosch, 40,000 fine trees were prostrated. The bridge across the Rhine at Wesel was carried away. A number of persons lost their lives, and several houses were burnt by lightning. In the circle of Torgau, the damage to the standing timber is estimated at \$150,000.

The Montreal Gazette of Feb. 25, says that a violent storm of thunder and lightning has been experienced in that city, during which the church of St. Thomas was nearly destroyed—the covering was displaced for 30 feet—and stones of great size removed.—*B. Mer. Jour.*

The introduction of the process of bleaching by chlorine has added largely to the supply of materials for paper-making, for not only the waste of cotton factories, but even the worn out bags in which the cotton is imported, are now made to serve the same purpose as linen rags.

Joseph Bonaparte is expected to return to this country in the packet ship Monangahela, on her next voyage.

Mammoth Hog.—A hog, weighing about 1300 pounds, 9 feet long, 7 feet 3 inches in circumference, is advertised to be shot for in York County, Penn.

SPLENDID DAHLIAS.

The following are in part a list of splendid Double Dahlias which will be for sale, in a few days, at the New-England Seed Store, 51 & 52 North Market Street, by G. C. BARRETT.

Barrett's Susannah; King of the Whites; Le Brilliant; Romulus; Hill's Mogul; Foster's Incomparable; Countess of Liverpool; Queen of Wirttemberg; Othello; Globe Crimson; Black Turban; Isabella; Barrett's Favorite, with singular dark foliage; Magnet; Colville Perfectæ; Purple of Tyre; Wm. Penn; Melicent; Count Balou; Orange and Yellow Dwarf; Franchina; Welles Dwarf Lilac; Rubens; Red Cockade; Trienda Purpurea; Bella Forma; Margareta (splendid) Dwarf Light Purple; do. Red; do. dark Purple; Cammie, dark centre; Semidouble White; White; Woods' Dwarf Red; Gen. Washington; Helianthus Flora; Elizabeth; Cocineæ; Ignisæus, fiery scarlet; President Adams; Abundantia Flora; Imperial; Scarlet Turban; Eclipse; with all the common varieties, too numerous to mention.

FRUIT & ORNAMENTAL TREES.

GEO. C. BARRETT, General Agent

—For all the principal Nurseries, in the vicinity of Boston, will faithfully attend to all orders for Fruit & Ornamental Trees, Grape Vines, Plants, &c. and the same will be delivered in the city, or sent on board vessels, without additional expense.

FARM FOR SALE.

On the road leading from Newton West Parish Meeting-House to Waltham Factory, containing from 50 to 75 acres of land, well proportioned into mowing and tillage—Also House, barn, and out-houses with the same. Said farm is well watered, and has a valuable fruit Orchard.

BRIGHTON CATTLE MARKET.

TO WHOM IT MAY CONCERN.

We, the undersigned, agree to attend the *Cattle Fair Hotel* in Brighton, for the object of purchasing Beef Cattle, &c. and will use all honorable means in our power to influence the seller and purchaser to unite in that place, and, if possible, to end an unprofitable and perplexing competition.

February 11, 1834.

FARM FOR SALE.

Situated in the South Parish in Andover, little more than half a mile southwesterly from Phillips' Academy and the Theological Institution, and about one mile from the Rev. Mr. Badger's Meeting-house,—containing about forty acres of valuable land, being the choice part of a much larger farm—having thereon one large and convenient two story dwelling-house, finished and in good repair, lately occupied as a boarding-house.—Also, near it, a one story dwelling-house in good repair. Also a barn ninety feet long, sheds, wash-house, wells of excellent water, gardens, fruit trees, &c.—A very eligible situation for any person desirous of retiring into a pleasant country town for the purpose of educating his children. The above valuable estate will be sold at public auction on Tuesday the first day of April next, at 3 o'clock P. M. Conditions of sale liberal.

Andover, Feb. 24, 1824.

REDUCTION IN PRICES OF TREES, &c.

WM. PRINCE & SONS have determined in consequence of the pecuniary pressure, to reduce the prices of a great variety of Trees and Plants, where orders are sent for a considerable amount: and all persons who desire Fruit and Ornamental Trees; Flowering Shrubs and Plants; Greenhouse Trees and Plants; Splendid Dahlias; or Seeds—will on applying to them direct by mail, with a list of the articles wanted, be promptly furnished with a printed sheet explaining the reduced rates.—The Chinese Mulberry, or Morus multicaulis are now reduced to \$25 per 100, and \$14 per dozen.—Apple trees in great variety \$20 to \$25 per 100.—Pears \$37½ per 100, and extra large ditto 50 cents each; and 50,000 are two, three, and four years grafted.—Peaches \$20 and 25 per 100.—Large Orange Quinces \$30 per 100.—English and Spanish Filberts \$25 per 100.—Fine Red Raspberries \$5 per 100.—Large Red and Yellow Antwerp \$16 per 100.—Gooseberries, finest Lancashire varieties \$20 per 100; and Large Red White and Black English Currants \$16 per 100.—Isabella Grape, 3 years old vines \$25 per 100, and 2 years ditto \$20 per 100.—Catawba, Alexander, Winne, York Claret, York Madera, and Scuppernon, \$25 per 100.—Herbmont's Madeira, Troy and Elmsburgh, \$30 per 100.—Norton's Virginia Seedling \$35 per 100.—The collection of choice European Grapes is unrivalled.—Chinese Ailanthus, 4 feet high, \$4½ per dozen and larger sizes in proportion.—A reduction is made on a great many kinds of Roses, Peonies, Chrysanthemums, &c.—Double Dahlias of such fine assorted kinds as have been most increased, will be supplied at \$3, \$4½ and \$6 per dozen, according to excellence, and selected by ourselves. The roots can be sent to any distance.—The new varieties of Flemish and English Pears having been introduced by us and greatly increased, the prices of the greater part have been reduced, and the trees are mostly of fine size and three years ingrafted.—The Ornamental Trees and Shrubs of most kinds are large and thrifty, and of double or treble the value of smaller ones, which is a most decided advantage, being a gain of several years in embellishment.

N. B. Having no Agent at Boston, the Commission of 10 per cent. usually allowed for Agency, will be credited to the purchasers, and be deducted from the amount of the bills rendered. The stock of Dahlias being so very large, they will be furnished on the most favorable terms possible. Linnæan Botanic Garden and Nurseries, Flushing, near New-York, Feb. 10, 1834.

GRAPE VINES AND EARLY POTATOES.

Catawba and Isabella Grape Vines, extra large size, by the hundred or single. Early Potatoes which obtained the premium for the last five years. For sale by SAMUEL POND. Cambridgeport, Feb. 25.

VALUABLE COUNTRY RESIDENCE FOR SALE.

Situated in Roxbury, near the late Doctor Porter's Meeting-house, consisting of about 3 acres of land, with a pleasant and convenient Dwelling House, Stable, and other out-houses—has also on it from 100 to 150 young and choice fruit trees, with a great variety of grape vines, shrubbery, &c.—Is within fifteen minutes' ride of State-street, and from its particular location is both very central, and at the same time as much retired as many places five and eight miles from the city. It has running through it or on its borders a delightful stream, and is every way one of the pleasantest situations in the vicinity. For terms and price, which will be liberal, apply to

Feb. 25 LUKE BALDWIN, 8, Merchants Row.

EARLIEST DWARF PEAS.

50 BUSHELS of the Earliest Dwarf Peas, being the earliest variety, having grown for eating in 38 days from time of planting, grows 20 to 24 inches high. This will be found an acquisition for a very early and good variety.

Raised expressly for, and for sale at

G. C. BARRETT'S

New-England Seed Store.

SITUATION WANTED.

A situation wanted by a Gardener, a married man who has no family, who could engage his wife as cook. Good recommendations can be given. Apply at this office. f 19

BRIGHTON MARKET.—MONDAY, MARCH 3, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 325 Beef Cattle, (including all unsold at Brighton last week, and 30 unsold at Cambridge) and 280 Sheep—all of which were at Brighton; at Cambridge—none.

PRICES. Beef Cattle.—A little better prices were obtained on middling and ordinary qualities, but no particular variation on the best, probably occasioned by the low price of Hides and Tallow. We noticed one yoke very fine taken at \$6, and several yoke at 5 75.—We quote prime at \$5 a 5 50; good at 4 75 a 5; thin at 4 50.

Sheep.—We noticed two lots only, sold. One at \$4 each, and one at \$7 37 each. We also noticed ten the finest we ever saw, no sale effected.

Swine—None at market.

We have been requested to state the price of Hides and Tallow, and from the best information we can obtain, we state as follows: Hides at \$5 on time, for those who have customers—Tallow at \$5 cash, at the end of the month. Those who have not customers cannot sell their Hides for more than 4 50 a 4 75 cash—several lots have been sold for 4 50 cash.

MISCELLANY.

From Brainard's Poems.

THE FALL OF NIAGARA.

Labitur et labetur.

THE thoughts are strange that crowd into my brain,
While I look upward to thee. It would seem
As if God pour'd thee from his "hollow hand,"
And hung his bow upon thine awful front;
And spoke in that loud voice which seem'd to him
Who dwelt in Patmos for his Saviour's sake,
"The sound of many waters;" and had bade
Thy flood to chronicle the ages back,
And notch His cent'ries in the eternal rocks.

Deep calleth unto deep. And what are we,
That hear the question of that voice sublime?
Oh! what are all the notes that ever rung
From war's vain trumpet, by thy thundering side!
Yea, what is all the riot man can make
In his short life, to thy unceasing roar!
And yet, bold babblers, what art thou to Him,
Who drown'd a world, and heaped the waters far
Above its loftiest mountains?—a light wave,
That breaks, and whispers of its Maker's might.

GUMPTION.

THIS is a fine old Scotch word, not generally to be found in the dictionaries, though it is worthy of a place in the best. It has a great deal of meaning in it, and often expresses what nothing else can.

When I see a girl reject the addresses of a respectable young man, who owns a good farm, goes to meeting, and pays his debts; for one who wears a dickey, visits the theatre, and spends his money faster than he earns it, I think to myself she has not much gumption.

When I see a young mechanic who wants a good wife, that can make a pudding, spit a turkey, and nurse his babies, dangling after a piece of affection, because she has been to a dancing school and can play on a piano, I guess he has not much gumption.

When I see a farmer paying taxes for twenty acres of land, half-fenced and half tilled, when he might raise more on six acres under good cultivation, I conclude he is not over stocked with gumption.

When I see a man who has a good business, sufficient to support his family respectably, neglecting his affairs, and running into debt, in order to obtain a political office, I fancy that, whatever may be his talents, he is not burdened with gumption.

When I see a man calling his boys from school, and spending two hours every afternoon for a month, to tar his trees, that the canker-worm may not ascend them, when he might effect a remedy, in a single day, by exchanging the earth for three feet around them, I conclude that he has more industry than gumption.

When I see a man purchasing three cords of wood for the winter, when, by listing his doors, and mending a broken pane, he might save two of them, I think he has but little gumption.

When I see a young man, just set up in business, keeping a horse and chaise at an expense of two dollars a day, and failing in six months, when he might walk for nothing, and continue his business with safety, I conclude that he has not much gumption.

When I see a man attending diligently to his own concerns, sending his children to school, pay-

ing his debts, and keeping clear of law suits, quarrels, and politics, I set him down as a man possessing a reasonable share of gumption.

When I see a woman mending her children's clothes, and receiving her husband with affection, I conclude she has no ordinary share of gumption.

In fine, when I see a man who deals justly, loves mercy, walks humbly, and pays for his newspaper, I conclude that of all others in this world he possesses the greatest portion of gumption.

HINTS TO HOUSEWIVES.

ABOUT the last of May, or the first of June, the little millers which lay moth-eggs, begin to appear. Therefore brush all your woollens, and pack them in a dark place covered with linen.—Pepper, red cedar chips, tobacco,—indeed almost any strong spicy smell,—is good to keep moths out of your chests and drawers. But nothing is so good as camphor. Sprinkle your woollens with camphorated spirit, and scatter pieces of camphor gum among them, and you will never be troubled with moths. Some people buy camphor wood trunks, for this purpose; but they are very expensive and the gum answers just as well.

The first young leaves of the common currant bush, gathered as soon as they put out, and dried on tin, can hardly be distinguished from green tea. Cream of Tartar, rubbed upon soiled white kid gloves cleanses them very much.—*Fr. Housewife.*

A BAT USEFULLY EMPLOYED.

IT was no idle speculation, when we proposed to introduce bats into kitchens to devour the flies. A friend of ours has since most successfully availed himself of the hint. The windows of the common sitting room being open, and a candle dimly burning, a bat entered; and passing into the entry, the door was immediately closed after him, which left him in the dark. A candle was then placed in the cellar kitchen, so as faintly to illuminate the stair-case, and in less than two minutes the bat descended into that apartment. He was honored with a light for about half an hour, during which time he was most actively engaged among the flies; and on visiting the kitchen very early in the morning, our informant found him wide awake, flying about the room. On opening the outer door he escaped, but more than one half of the stock of flies had disappeared. He will be well received in future, and invited in as often as opportunity occurs.—*Genesee Farmer.*

A RELICT OF THE OLDEN TIMES.

THE Marblehead Gazette relates that one of the guns, a two-pounder of the privateer Free Mason, which blew up in the harbor of Marblehead, in the year 1779, was discovered and taken from the bottom, on Thursday last, in a good state of preservation. The charge being drawn, the powder was found to be good, after having laid at the bottom 55 years. It was to be used on Saturday, in firing the salute, in honor of Washington's birth-day.

RAMMOHUN ROY

—THE late Hindoo Reformer, often repeated three favorite maxims: 1. *Political*—'Man is the slave of benefits.' 2. *Moral*—'The enjoyment of the two worlds [physical and intellectual] depends on two things—kindness to friends, civility to enemies.' 3. *Religious*—'The most acceptable service to God is, to do good to man.'

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 5 1/2 miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

COTTON GOODS AT REDUCED PRICES.

For the New England Farmer.

DRAINING SWAMPS.

MR. EDITOR, The attention of the community at the present time seems to be mainly directed to one object, or to say the least, one object engrosses a much greater share of thought and conversation than any other, and like 'Aarou's rod swallows up all the rest'—namely, the *currency of the country*. Nor should it be deemed strange that such should be the fact, if we consider that whatever may be denominated money, stamps the value of all other commodities, according to its appreciation, or depreciation in the money market, and the *credit* given to the currency.

But although I am willing to concede that we have "fallen upon evil times," yet I am by no means willing "to give up the ship," and however much property may depreciate in value, I can but look forward for a redeeming principle, with hope, and no small share of confidence, to brighter days, and better times; and it is this consideration that induces me at this time to request a portion of the attention of the community to a subject, which in this section of the country, so far as my knowledge extends, has hitherto been much neglected.

The subject to which I now solicit attention, is the draining of swamps and low grounds, with a view to augment, and accelerate the growth of wood and timber.

It is universally admitted that wood is a necessary and indispensable article to the comfort and happiness of man; and that in many parts of the country it is becoming scarce and dear. If such be the fact, whatever can be done to increase the quantity in the shortest given time, should by no means be neglected; and those persons most successful in producing such a result, would be as much entitled to the thanks of the community, as he who, by superior management, should be the instrument of producing "two spires of grass where but one grew before."

It is believed that in the New England states there are many acres of swamp, and hoggy land, that are now nearly valueless, and that they are wholly so in consequence of stagnant water having lain upon them for ages; and the few trees that may be seen here and there, in a thin and scattered state, are short, scrubby, mossy, unhealthy and unthrifty.

There is another description of swamp land, somewhat different in soil and situation from that which is considered mere bog; I mean those swamps situated on brooks and small streams, many of which have a soil varying in depth from one to three feet, and which are nearly dry at the surface occasionally, and in their present state may yield from ten to thirty-five cords of wood per acre; but in the condition they now are they will not produce that amount of wood in a less time than from forty to sixty years between cutting; the growth being much retarded by the superabundance of water lying at the roots of the trees.

To remedy the foregoing defects in soil and situation, and render them more productive, and consequently more profitable, I beg leave to suggest, as being probably the *best means* that can be

used, that of draining, wherever it can be done without incurring an expense greater than what would be the probable amount of benefit resulting from the operation.

There are many acres of swamp land within my knowledge, which may be sufficiently drained, at an expense not exceeding one dollar per acre; and I believe that I hazard nothing by saying, that if those lands were fairly drained of the superabundance of water, that the growth of wood would be so far accelerated thereby, that the amount of wood grown on an acre would be as much in thirty years, as it has heretofore been in forty or forty-five years; thus making a saving of from ten to fifteen years in rapidity of growth, and the interest for an equal length of time on the value of the wood taken off.

On bogs where the growth is thin, scrubby and mossy, after being well drained, I would recommend, that the growth then on the ground, whatever it may be, whether wood, or brush, should be cut close and clean, as near even with the surface as is practicable; and in all places where a growth of wood is desired, cattle should not be suffered to go; ever remembering that cattle are as fatal to the growth of the young and tender shoots of trees, as they would be to the successful growth of a field of Indian corn in the month of July.

R. HOWARD.

Easton, Feb. 25, 1834.

For the New England Farmer.

ARTIFICIAL FISH PONDS.

MR. EDITOR, Being about to make an artificial Fish Pond, and seeing some remarks made by a Rhode Island committee which were published in your 5th volume on the "*Raising of Fish in Fresh Water Ponds*," I take the liberty to inquire through the medium of your paper, whether some of those gentlemen, committee men, will not answer the following inquiries:

1st. Whether they have made any artificial fish ponds—and if so with what success?

2d. Will salt water fish thrive best in fresh water ponds?

3d. What sort of fish are the most prolific to stock a pond with—and which are the most desirable for the table?

4th. Is it advisable to put a variety of kinds in one pond?

5th. What food is required to feed the fish with?

6th. Is a fish called the *carp* known in your section of the country? and if so, what are its qualities?

Any other information on the subject of rearing fish in fresh water ponds will be duly appreciated by
A SUBSCRIBER.

For the New England Farmer.

PRESERVATION OF INK.

MR. FESSENDEN—Sir, You are at liberty to publish the following, if you think it worthy of notice.

It is well known that the common writing ink, commonly made of vinegar or water for the liquid, causes the ink to mother, dry, and of course becoming thick, and unfit for use, unless often mixed up. Having occasion lately to make use of some

strong salt-brine, for a certain purpose, and placing the vessel containing the brine near my inkstand, the thought occurred to me, that it would prevent the mothering and drying up of the ink, by mixing it with the thick substance in the inkstand. Accordingly I mixed some of the brine with the inky matter, and found, upon a fair trial, my anticipation realized. It keeps the inky compound entirely free and open, consequently the pen clean, which is a great desideratum with all who have use for the goosequill. Please try and satisfy yourself.
J. N. B.

From the New York Farmer.

TO REMOVE VERMIN FROM CATTLE.

A DECOCTION of tobacco is very good, but it often makes the animal very sick for a short time. A better remedy is to mix plenty of strong Scotch snuff in train oil, and rub the back and neck of the creature with it, which will effectually drive away or kill all vermin.

Curwen observes that "the best preventives against fleas in hogs, lice in cattle, and ticks in sheep, are corn meal and good care." Hickory ashes thrown upon swine, not only assist in destroying fleas, but in removing cutaneous diseases, by causing the animals to rub themselves frequently.

From the Genesee Farmer.

BLOODY MURRAIN.

It is believed that the cause of Bloody Murrain, which is a disease very common and fatal to cattle in many parts of the United States, has not yet been discovered and explained; and it is therefore deemed proper to state the following facts, which seem to show that it is caused by leeches, taken with the water drunk by the cattle. These facts may be the means of directing the attention of farmers to the subject, and also to the importance of supplying cattle with pure water.

A farmer in Madison county, Ohio, had lost several of his finest cattle by this disease, and upon opening them he found leeches in their stomachs, much swollen by the blood they had extracted, and it was also found that leeches were living in the water at which the cattle were in the habit of drinking. Believing that this was the cause of the disease, he changed the water, and in future only gave them that which was pure; and for three years his stock had not been troubled with that disease.

Although this seems to show very conclusively that leeches are the cause of the disease, yet it requires further investigation before the question can be entirely settled.
S. L.

27,000 CROWS

—WERE destroyed this season at Dupplin by the demolition of between 11000 and 12000 nests, by contract for £25 sterling.*** In opposition to this spirit of persecution it is said that nine tenths of their food consists of worms, insects and their larvæ; and by every one who knows how destructive to vegetation are the larvæ of the tribes of insects and worms, some slight idea may be formed of the devastation which rooks are the means of preventing.—*Loudon's Gardener's Magazine.*

From the Genesee Farmer.
MANAGEMENT OF FIREWOOD.

We hardly know of any business in which reform is more needed than in the management of fire-wood; and as this is the principal season of cutting and procuring it, the following particulars may be worthy of attention.

Wood that is cut by the cord, and designed to stand through the summer, should not be left in the woods, nor under shade of any kind. Raise the bottom tier of sticks a few inches from the ground, for without this precaution it will be much damaged, and decayed timber enough to serve for this purpose may be generally found in the woods. The sticks when corded ought to range east and west so that the sun may shine in at both ends, the piles consequently extending north and south.

On account of its drying better, no stick should be split into less than four pieces, except it be very small, or except it be designed for back-logs; and to prevent the last from becoming doted, it ought to be placed on the top of the pile where it can receive sun and air enough to compensate for its greater size.

An honored friend of ours assures us that the quality and value of fire-wood is much affected by the time when it is first cut. He recommends it to be done in winter, being careful to have it finished before the sap begins to rise. We are disposed to adopt his opinion; and though it is not in our power to furnish any estimate of the comparative or relative value of two parcels of the same kind of wood, cut at different seasons of the year,—yet we have found a great difference, which we know not how to ascribe to any other cause; and we should be much obliged for observations on this subject.

We intend the foregoing remarks more especially for those who have large quantities of wood either for the market or to keep over year, and who may wish to preserve it in the best order; but we have also a few words for such as do business on a smaller scale.

We have heard old mechanics say that "the month of March is the best month in the whole year for drying stuff" or timber; and we believe the remark has been founded on observation. We would not assert that it would season more than in one month of severe drought in summer; but such droughts are very rare in this district; and taking several years together we think the average would best accord with that old saying. We shall therefore unhesitatingly recommend to every house-keeper to have his wood ready split and piled up to take advantage of the drying weather of that month.

If the wood stands out, exposed, let it have all the benefit of air and sunshine by ranging it in single rows to the north and south. Where chips are plenty they may be heaped on the top of the wood, and rounded so as to shed the rain. We have found it by experience to be an excellent arrangement.

WORKING MEN.

THERE are two sorts of labor, first working for profit—and working for nothing. Persons who have nothing to do, generally have hard work to live. Let such read the following:

A late distinguished senator said in the parliament of England, "man is born to labor as the sparks fly upwards." This observation is founded on a thorough knowledge of the destiny from

which none can escape. The idle are always unhappy, nor can mental vigor be preserved without bodily exercise. Neither he who has attained to inordinate wealth, nor he who has reached the greatest heights of human intellect is exempt from the decree, that every man must "work for his living." If the "gentleman" does not work to maintain his family he must to maintain his life; hence he walks, rides, hunts, shoots, and travels, and occupies his limbs as well as his mind; hence noblemen amuse themselves at the turning lathe, and the workman's bench, or become mail coachmen, "cutter-lads;" and hence sovereigns sometimes "play at being workmen," or, what is worse, at the "game" of war.

Without exercise the body becomes enfeebled, and the mind loses its tension. Corporeal inactivity cannot be persisted in even with the aid of medicine, without symptoms of an asthenic state. From this deliquium the patient must be relieved in spite of his perverseness, or he becomes a maniac or a corpse. Partial remedies render him "a nervous man;" his only effectual relief is bodily exercise.—*Genius of Temperance.*

From the Genesee Farmer.
DUNGING IN THE HILL.

Dunging in the hill appears to us an injudicious method of applying manure, even when the quantity is small. It gives to the plant a luxuriant start, provided the manure is rotted, but too often proves of little value afterwards. It is mostly used in this way upon corn. If the manure is long, or dry, and dry weather ensues, it firebrands or does not rot, and the crop is little benefited; and for the next crop it benefits only parts of the soil where the corn has grown. The small fibres of the roots are the mouths of the plants through which the food passes to the stock. If we examine the roots of corn we shall perceive that they extend as far in the ground as the stocks do above. Hence it will be perceived, that the dung, if placed in the hill, cannot benefit the roots nor materially the plant, after they have extended beyond the circle where it is deposited. Whereas if it is spread and buried in the soil, it benefits them in their whole extent; there probably not being a square inch of ground in the field into which the roots do not penetrate in search of food. We would thank some of our readers to make an experiment, and communicate to us the result. Let half an acre have ten loads in the hole, and another half acre ten loads spread broadcast, and note the product of each in corn and the crop which follows it.

SLAUGHTERING ANIMALS WITHOUT PAIN.

In the Veterinary School at Edinburgh they practise a method of killing horses with comparatively no pain, by opening the jugular vein, and inserting a metallic tube, the thickness of a quill and blowing in atmospheric air. Three forcible expirations from the mouth are sufficient to cause the animal to die instantly, with apparently no pain. The "Association to Promote Rational Humanity" would recommend this method for killing cattle, if it should be found expedient.—*N. Y. Farmer.*

From the Genesee Farmer.

CANADA THISTLES.

OBSERVING the grass killed in the spring where pounce had been fed to cattle the fall before, I took the hint to make an experiment on a bed of

Canada thistles. Soon after they made their appearance in the spring of 1832, I carted pounce from my cider mill, and spread it on a patch of them two or three inches thick; and on scattering stalks I put a shovel full, and left a heap for future use. A few stalks showed themselves through the pounce, which I carefully covered up again, treading it down pretty snugly. During the summer of 1833, I closely watched my old bed of Canadians, and think there were but three stalks that made their appearance—those I pulled up. In the fall, I could not see a single stalk alive.

If I mistake not, I have mowed these thistles ten or fifteen years, and do not believe they ever went to seed more than once or twice since I first discovered them. A YANKEE.

DOGS AND SHEEP.

ON Saturday night last, two dogs made terrible havoc in a flock of sheep belonging to Mr. Herman Smith, who resides in the western part of this town, near Shepherd's Factory. They killed 28 and wounded 12 more, most of them mortally, and two are missing. They seemed to be expert butchers; they bit the sheep in the neck and let out their blood with as much dexterity as an old wolf. We are informed that other flocks have recently suffered some loss from dogs. Yet the dogs cannot be found; no man is willing to acknowledge himself the owner of such villainous dogs. In this state of things, dog-owners need not be surprised if war is declared against the whole canine race. There is a place in Southampton called "Hang-dog Swamp." A hang-dog place is wanted in some other towns, and frequent executions.—*Hampshire Gazette.*

BREEDING.

A cross of a merino buck, with a Leicester ewe says Sinclair, in the course of four or five generations, will produce fleeces rivalling in fineness Spanish fleeces. This is on the principle laid down by Cline and other breeders, that the male gives a character to the exterior of the offspring.

EVERGREENS FOR SHEEP.

As food for sheep, evergreens are considered rather medicative than nutritive, says Mr. Hogg, in the Transactions of the Highland Society. When obliged to eat them in considerable quantities, and frequently and constantly, too, they cannot have an effect other than injurious; but when in smaller quantities, in connexion with other food, they very probably give a strengthening tone to the stomach.—*Genesee Farmer.*

LEMON TREE.

IN the green house of the late Hon. T. Bigelow, of Medford, there is a lemon tree, which, besides its foliage, its buds and flowers, has on it about three hundred lemons. These are, of course, of all sizes, from the smallest to the largest, which are sixteen inches in circumference. The tree is supposed to be about fifty years old. It was given to Mr. Bigelow by the lady of the late Hon. Wm. Gray, about twenty-five years ago. It is emphatically a perennial, being never without foliage, flowers and fruit. Perhaps some of the credit of rearing and perfecting this splendid exotic may belong to the gardener, whose watchfulness and care have been applied to it during the whole time that it has been in its present place.—*Courier.*

LIME AS A MANURE IN THE GENESSEE COUNTRY.

I HAVE had some opportunities to observe the extraordinary fertility of lands lying at the base of limestone ridges; and have been led to believe that though our farms were comparatively rich, they might very profitably be made richer by the application of lime.

Some farmers have held the notion that lime was not useful except when applied in its caustic state; but it is an error that ought to be corrected. Marl, which commonly contains about fifty per cent. of calcareous matter, is never caustic. So that if the limestone be finely pulverized, its effects will be the same, whether it has been *ground*, or *burnt* or *disintegrated* by the weather, and the particles carried down from these rocks in heavy rains are found greatly to fertilize the lands below.

I remember an instance of this kind, in which a horizontal stratum of limestone, only a few feet in thickness, occurred on the side of a high hill. Below the rock, the land was remarkably fertile; and differed entirely in the luxuriance of its vegetation, from the more unproductive soil above.

In making a valuation of some land a few years ago, in company with an old shrewd farmer, who had become wealthy by employing his eyes as well as his hands, he remarked to me in reference to a small tract lying at the base of a calcareous ridge, "I would be willing to give a hundred dollars an acre for that land;"* and on conversation with the occupant, he said it never failed to produce extraordinary crops. It had a bluish cast like some kinds of marl, mixed with some vegetable matter.

New countries have generally been settled by persons who never inquired whether the lands were calcareous or not. In a state of nature, there is little to indicate to the uninstructed that some lands under culture will be more durably fertile than others. A thrifty growth of timber is often found on silicious soils, not well adapted to heavy crops of grass or grain; and many of our wild plants grow luxuriantly, and seem to require nothing more than vegetable earth. Yet from these two circumstances, many a new settler judges of the quality of land. The axe however cuts off the supply of leaves; the plough and the harrow expose the muck to a new action of the elements; and in a few years under the operation of severe cropping, the dark color and the fertility of the soil disappear together. The proprietor discovers that his farm is not worth half as much as some neighbor's, who was so fortunate or so skilful as to settle on limestone land.—A. F. *Genesee Farmer.*

From the Ohio Farmer.

WHEAT.

MR. EDITOR:—As the object of your paper is to benefit the farming interest of the country, I would take the liberty of suggesting a simple experiment in the raising of wheat, which I think I have tried to my full satisfaction—I mean the continuing of wheat crops upon the same land, for three or four years in succession.

My mode is this—after the crop is off, I turn in my cattle and hogs to range on the stubble, and to pick up such loose heads and grains as they may find, until the first of October, or thereabout. I then give the ground a single ploughing, sow the seed and harrow it in. I have tried this for three years in succession, and the last crop was better than the first, and equally as free from *cheat*, as

* When other lands were worth from twenty-five to thirty dollars an acre

that sowed in other ground, or as the first crop. Another circumstance inclines me in favor of this practice.—While others were complaining of *blight* and *mildew*, my wheat was untouched with either. As I consider an ounce of facts worth a pound of theory, I merely give them, yielding to abler hands the task of theorising. And satisfied am I, that every farmer that wishes to thrive, should be awake to the improvements of the day. R. F.

POTATO BALLS.

A LADY of our acquaintance recommends the following preparation:

"Mix mashed potatoes with the yolk of an egg—roll them into balls—flour them—or egg and bread crum them—and fry them in clear drippings [or lard], or brown them in a Dutch oven."—*Gen. Farmer.*

HINTS TO HOUSEWIVES.

It is easy to have a supply of horse-radish all winter. Have a quantity grated while the root is in perfection, put it in bottles, fill it with strong vinegar, and keep it corked tight.

Poke-root boiled in water and mixed with a good quantity of molasses, set about the kitchen, the pantry, &c., in large deep plates, will kill the cockroaches in great numbers, and finally rid the house of them. The Indians say that poke-root boiled into a soft poultice is cure for the bite of a snake. I have heard of a fine horse saved by it.

A little salt sprinkled in starch while it is boiling, tends to prevent it from sticking; it is likewise good to stir it with a clean spermaceti candle.

A few potatoes sliced, and boiling water poured over them, makes an excellent preparation for cleansing and stiffening old rusty black silk.

Green tea is excellent to restore rusty silk. It should be boiled in iron, nearly a cup full to three quarts. The silk should not be wrung, and should be ironed damp.

Lime pulverized, sifted through coarse muslin, and stirred up tolerably thick in white of eggs, makes a strong cement for glass and china. Plaster of Paris is still better; particularly for mending broken images of the same material. It should be stirred up by the spoonful, as it is wanted.*

A bit of isinglass dissolved in gin, or boiled in spirits of wine, is said to make strong cement for broken glass, china and sea-shells.

Do not wrap knives and forks in woollens. Wrap them in good, strong paper. Steel is injured by lying in woollens.

Do not let coffee and tea stand in tin.—Scald you wooden ware often; and keep your tin ware dry.

Barley straw is the best for beds; dry corn husks, slit into shreds, are far better than straw.

Straw beds are much better for being boxed at the sides; in the same manner as upholsterers prepare ticks for feathers.

Brass and iron should be cleaned, done up in papers, and put in a dry place, during the summer season.

If you have a large family, it is well to keep white rags separate from colored ones, and cotton separate from woollen; they bring a higher price. Paper brings a cent a pound, and if you have plenty of room, it is as well to save it. 'A penny saved is a penny got.'—*Frugal Housewife.*

* Some think it an improvement to make whey of vinegar and milk, and beat it well up with the eggs before the lime is put in. I have heard of iron mended with it.

From the American Farmer.

CORN BREAD.

Virginia, Feb. 1, 1834.

As receipts for making different kinds of bread are occasionally published in the Farmer, perhaps it may not be deemed obtrusive in me to mention a way of making corn bread, which, if properly done, cannot fail to be highly esteemed.

Take one quart of corn flour, one half spoonful of lard, half a spoonful of salt, two spoonfuls of yeast, and warm water sufficient to make a batter that will drop freely out of the spoon. Set it in a pitcher or other vessel by the fire to keep moderately warm. It will become very light in eight or ten hours, and should be baked in a Dutch oven or spider, at the same time greasing the oven well. A cooking stove will answer equally well. The bread will be soft and spongy if properly managed, and greatly superior to what is termed *pone*. It should be served hot for breakfast or supper.

In order to have good bread it is very necessary to have good meal. It should not be ground too fine, for that will make the bread clammy and unwholesome. There is also great choice in the kind of corn. The best I have ever seen for family use, is what we call in Virginia *hominny corn*. The grain is white, very flinty and clear, sometimes almost transparent. It makes a richer bread than the softer varieties of the species.

CLEANING PLATE WITH DRY PLATE POWDER.

This gives plate a most brilliant lustre, if it is only well done, and should be rubbed on with your naked hand, such as spoons, forks, and dessert knives that have silver blades. These small articles are cleaned by taking some of the powder between your finger and thumb, and the longer you rub, the better it will look; any article of your plate that is ornamented, this part may be rubbed with a piece of leather dipped in the plate powder, and rubbed quick, and hard; then it should be brushed with your plate brushes, and polished off with your shammy or wash leather; and I will warrant your plate to look beautiful.

In the next place you must remember to keep your plate in a dry place, for if you let any articles that are only plated, lay about dirty, or in a damp place, they are sure to rust if plated on steel; and if plated on copper, they are sure to canker; therefore you should be particular, and not leave salt or acids of any kind on plated ware, as it is sure to take off the plate, and leave a stain, and by rubbing this stain the plate will rub off; by which means the article is perfectly spoiled. I very well know that there are many articles of this kind, that are often spoiled through the neglect of servants, and especially young hands, that have had no experience of those things; therefore, my young friends, I have here given you such directions as I trust will enable you to keep your plate in such order as may give general satisfaction to your employers, and gain credit for yourselves.—*H. Direc.*

BEEF CAKES.

MAKE fine some beef that is rare done, with a little fat bacon; season with pepper and salt, and otherwise as preferred: mix well and make into small cakes three inches long, and half as wide and thick, and fry them a light brown, and serve with gravy.—*Northern Farmer.*

For many years the agriculturists of our country have been in the habit of recording the results of their observations and experience in short and desultory articles which are now dispersed through a great many volumes of agricultural papers. These essays are in many instances well written, and highly valuable,—and, taken together, they form a body of information whose value is beyond all calculation. Being mostly from the pens of practical men, who write from experience, and who know the facts they state to be true, they can be relied upon with perfect confidence. We have now fifteen volumes of the *American Farmer*, twelve of the *New England Farmer*, and perhaps sixty or seventy volumes of other papers of the same kind, all of which are full of information, and essays of this description. But as this matter is dispersed through so many volumes, without order or system, the different subjects treated of being divided, and disconnected, it is almost impossible to trace it out. Much valuable information

tion, it is believed, is disregarded on account of the difficulty of finding it, and from the fact of its being presented in an unsystematic, and irregular manner.

In order to remove these difficulties, I propose, (and respectfully suggest to those who take an interest in the advancement of agricultural science,) that the whole subject be divided into about fifty parts, and invite fifty different gentlemen, who are qualified, and acquainted with the subject, to write treatises on each separately. Each treatise to be confined to one branch of agriculture—to be full and complete in itself—written in a plain, clear style,—and in all cases to give the best and most approved views of the subject. The whole should be entirely AMERICAN,—no compilations from foreign works—but adapted to our own soil and our own climate, and condition.

The first treatise should of course be a kind of introductory or preliminary discourse.—The

An agency should be established at some central place, say at Philadelphia, whose duty it should be to receive these Treatises, and after submitting them to a board of agriculture, for their approval, attend to their publication. They should be published in volumes of from 250 to 300 pages, and of the size called 12mo. Each volume to be accompanied by a copious index. They would form what might be called the "American Farmer's Library," and would be a standard work for reference on all occasions, the advantages and value of which will readily be perceived by every intelligent reader. If suitable exertions were made, on the part of the friends of science in our country, there can be no doubt but that the object may be fully attained. Would it not be an honor to our country?

If the editors of other agricultural papers throughout the Union, approve the project, they are requested to give this communication a place in their columns.

Respectfully submitted, J. A. LAPHAM.

From the New York Farmer.

JERUSALEM ARTICHOKE.

ALTHOUGH this vegetable is generally known in this country, still it is questionable if a full and satisfactory experiment was ever made. We make the following extract:

"I was determined to prove whether or not they could be cultivated to greater advantage than the potato, as food for cattle. One sack was consumed by a young calf at hand; it ate them with avidity, and improved on them. I took the other two sacks and planted them in the midst of a five acre piece of potatoes. I set them whole without cutting, measuring correctly an eighth part of an acre; the produce was in proportion to six hundred and forty bushels per acre—the potatoes three hundred and twenty-seven bushels. The following year, the memorable one of 1826, I planted half an acre on a piece of thin gravel, old tillage land, in its regular course of preparation for a vegetable crop after wheat; they maintained their verdure through that extraordinary dry summer, and produced one hundred and fifty bushels; but the potatoes by the side of them were completely set fast; they never formed a bulb. The year following I set an acre on part of the same kind of soil, but of better quality; it produced five hundred and seventy bushels *without any dung*. An half an acre on the same land, with the usual quantity of dung for turnips, produced two hundred and ninety bushels (a bad compensation for eight loads of excellent dung.) This present season, an acre on the same land (part of my turnip-fallows) produced five hundred and seventy-six bushels; but the wet state of the soil when taken up, and being a vegetable of uneven surface, which causes the soil to adhere to it more than to a potato, renders it difficult to come at the exact quantity. From an experiment I made of washing a sack, I can safely assert, I have five hundred and thirty bushels of clean roots; whilst the vegetables on our flat gravels do not equal this by full fifty per cent. in value, except the potato, which produced three hundred and eight bushels on the same soil. I could never raise more in favorable seasons.

"The cultivation of the artichoke is the same as of the potato, except that it requires to be set early—not later than March; if laid above ground all winter, it is proof against the severest frost. When once cleaned, no weed can live in its dense shade; horses, beasts, and sheep, consume it with avidity; pigs prefer a potato to it in its raw state, but prefer the artichoke when boiled or steamed. It attracts the game in a most extraordinary way; they resort to its shade in autumn; it forms one of the finest covers in nature. We are so fortunate as to have but little game in our lordship; I do not recollect ever having seen even a Swedish turnip bitten by a hare or rabbit, notwithstanding they will consume the artichokes left by the men in securing them.

"If potatoes can be profitably cultivated as food for cattle, compared with Swedish turnips, mangold wurtzel, the sugar beet, &c. (which I much doubt,) the artichoke is vastly superior to them. The expense of culture is no more; it is not liable to be injured by frost; can be taken up at pleasure; it produces at least thirty per cent. more, and on poor land full fifty per cent.; is far more nutritious, and leaves the land perfectly clean. The only objection that can be urged against their cultivation for cattle in competition with potatoes is

that they require more care in taking them up. The frost not acting upon them so as to destroy vegetation, what are missed will, of course, grow amongst the succeeding crop, but I have found very little inconvenience in this respect. D. L."

From the Maine Farmer.

HOPS.

I HAVE been thinking for sometime past of sending you a conversation that I had with a woman, when on my way to Bangor in October last. I stopped at a tavern in North Newport and called for some oats for my horse. I noticed that the Landlady got them for me herself. With true Yankee curiosity I asked if her husband was not at home. She answered, No; he was gone to Bangor to sell his hops. Hops, said I, we used when I was a boy to have one hill, but neglected to pick that, half the time. We have, said she, an acre and a half. All to Hops! said I, what do you do with so many? for I am a real Yankee to ask questions, especially when I can converse with a pretty woman: and here the following dialogue commenced:

Landlady—Send them to Boston.

Yankee—How much do you get for them?

Landlady—20 cents per pound.

Yankee—How much will one acre yield?

Landlady—About twenty hundred.

Yankee—How many did you raise on your acre and a half?

Landlady—Thirty hundred and fifty pounds.

Yankee—How much does it cost to raise them?

Landlady—A little more than it does to cultivate the same quantity of land in corn.

Yankee—How many hills do you put to an acre?

Landlady—Twelve Hundred,—but La, says she, for I suppose she thought I should never get through with my Yankee questions, we neighbors raise enough to bring us in Six Thousand Dollars.

I thought I would ask one more question, and that is—How many in number do your neighbors consist of. Her answer was, twelve or fifteen. Thinks I to myself, if one acre of Hops are worth four hundred dollars, it is about time to stop trying to raise Corn, to say the least if the seasons to come are to be like the two last. A YANKEE.

P. S.—I learnt from my good Landlady that the land best adapted to raising hops is a loam inclining to sand.

WINSHIPS' GREEN HOUSE AT BRIGHTON.

This is probably the most extensive and splendid Green House in this country, and the collection of plants which it now contains is superior and brilliant beyond description. There is in it upwards of *four thousand* plants in pots, of every variety, many of which are now in full bloom, and present in coup d'œil, the most beautiful exhibition of the kind we have ever witnessed. It is kept at an even temperature by heated water, conveyed in pipes around the building. The arrangement of the pots in this green-house is in several respects peculiar, and highly advantageous for display and access; walks are beautifully laid with white marble, and the building is finished with the most perfect modern improvements. It is of itself worth a visit to Brighton, and in the approaching season will afford an opportunity for visitors to gratify their taste as well as curiosity, and to possess themselves of the most perfect specimens of rare and splendid plants.—Atlas.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MARCH 12, 1834.

SPRING WORK.

MANURE. Different plants require different sorts of manure, as well as greater or less quantities. "It is certainly true that *ding* is not the best sort of manure for a garden: it may be mixed with other matter, and if very well rotted, and almost in an earthy state, it may not be amiss; but if otherwise used, it certainly makes the garden vegetables coarse and gross, compared to what they are when raised with the aid of ashes, lime and composts. Besides dung creates innumerable weeds; it brings the seeds of weeds along with it into the garden, unless it first be worked in a hot-bed, the heat of which destroys the vegetative quality of the seeds."*

Salt and lime are very efficient destroyers of slugs, snails, grubs, &c. Lime spread over a soil when it is hot or caustic, destroys insects and their larvæ or eggs; and when it becomes slack, and is taken up, or held in solution by water, it becomes a constituent of plants. "It is astonishing" (says a writer in the Gardener's Magazine) "how ignorantly neglectful are the cultivators of the soil, when their crops are devastated by slugs, not to dress the soil so as to render its surface quite white, during the promise of a few days of dry weather, with caustic lime. It is instant destruction to every slug it falls upon, and those whom it misses are destroyed by their coming in contact with it, when moving search of food."

Charcoal dust. Thomas Smith, a writer for *London's Magazine* observes, "For the last six years I have had most excellent crops of onions, and not the least appearance of any infection. My first experiment I made on a bed fifty feet long and five feet wide, prepared in the usual way, one half of the bed was dressed with charcoal dust and the other half without it. The part on which the dust was laid, had an excellent crop of onions, it remained quite clean and free from disease, while the part to which the dust was not applied, was entirely destroyed by the grub and by mouldiness," &c. He then relates another similar experiment, with a similar result. The charcoal dust was "spread upon the top of the ground intended for onions, about half an inch thick before the seed was sown (the ground being previously well dug and manured,) and merely scuffled in with the point of a spade, so as to mix the top soil and charcoal dust together."

"The charcoal dust ought to be kept quite dry, which is easily done by placing it in a round heap and covering it closely over with turf till it is wanted." It likewise seems from experiments made by the same gardener, that charcoal dust is a remedy against "the clubbing in the roots of cabbages."†

Temperature of Soil.—There can be no doubt that charcoal is not only useful as a manure, as an antidote to the diseases and insects which injure plants, but that it operates beneficially, by increasing the warmth of the soil: "Many soils are popularly distinguished as *cold*: and the distinction, though at first view it may appear to be founded on prejudice is really just.

"Some sorts are much more heated by the rays of the sun, all other circumstances being equal,

than others; and soils brought to the same degree of heat cool in different times, that is, some cool much faster.

"This property has been very little attended to in a philosophical point of view; yet it is of the highest importance in agriculture. In general, soils that consist principally of white clay are heated with difficulty; but being usually very moist, they retain their heat only for a short time. Chalks are similar in one respect that they are heated with difficulty but; being drier they retain their heat longer, less being consumed in causing the evaporation of their moisture.

"A black soil containing much soft vegetable matter, is most heated by the sun and air; and the colored sods, and the sods containing much carbonaceous (coaly) matter, or ferruginous matter (matter impregnated with iron) exposed under equal circumstances to the sun, acquire a much higher temperature than pale-colored soil.

"When soils are perfectly dry, those that most readily become heated by the solar rays, likewise cool most rapidly; but I have ascertained by experiment, that the darkest colored dry soil (that which contains most abundance of animal or vegetable matter; substances which most facilitate the diminution of temperature,) when heated to the same degree, provided it be within the common limits of the effect of solar heat, will cool more slowly than a wet pale soil, entirely composed of earthy matter.

"Nothing can be more evident, than that the genial heat of the soil, particularly in Spring, must be of the highest importance to the rising plant. As when the leaves are fully developed, the ground is shaded; and an injurious influence, which in the summer might be expected from too great a heat entirely prevented; so that the temperature of the surface, when bare and exposed to the sun, affords at least one indication of the degrees of its fertility; and the thermometer may be sometimes a useful instrument to the purchaser and improver of land."

WATER BURNERS.

A MR. RUTTER, of London, has put into operation a plan for generating heat by the combustion of water, converted into steam and mixed with "bituminous, oleaginous, resinous, waxy and fatty substances in a fluid state." A writer for the *London Mechanical Magazine* gives the following remarks on this invention:

I perceive by your last notice that Mr. Rutter is preparing for publication a work on the application of his new principle, and I beg to assure him that he has my sincere wishes for the complete success of his patent, &c.

It occurred to me, that about fourteen years since, in consequence of a paragraph which had then met my eye, I had been induced to make the following experiment: About equal portions of common tar and water were put into a half-pint glass retort, after which the orifice of the beak was reduced, by drawing out at the table blowpipe, to about one eighth of an inch diameter. The retort being fixed over an argand lamp, the apparatus was taken into my garden on a dark night, and the contents of the retort brought to a state of brisk ebullition. As soon as vapor issued with rapidity, a light was applied, and in an instant I beheld a jet of flame eight or nine inches in length, constituting a brilliant firework, the intense heat of which was found capable of melting several refrac-

tory mineral substances. I lay no claim to originality in this little experiment, which is precisely the same in principle as Mr. Rutter's method, and this the following extract, which gave rise to my experiment, will show:

AMERICAN WATER-BURNER.—An apparatus, called the American Water-Burner, has been invented by Mr. Morey, of New-Hampshire. It is a rough blowpipe, but is applicable in many cases in place of a furnace. Tar is intimately mixed with steam, and made to issue from a small jet, in the manner of an eolipile, and the stream of matter being ignited, produces a flame of great size and intensity. It appears that the water is partly decomposed towards the middle of the jet, and that the heat is thus increased by increasing the quantity of active agents; but, whatever the exact effect, the water is found to be useful in preventing the formation of smoke, and increasing the combustion."—[*New Monthly Magazine*, April, 1819.]

Perhaps, Mr. Editor, you will indulge me in a few more remarks. In the autumn of 1827, a scientific friend and myself succeeded in beautifully illuminating a very large room, used as our laboratory, with gas obtained from the decomposition of resin; and being at the same time occupied with the oxygen blowpipe, in producing intense light by means of lime and other substances, it occurred to us that the light thus furnished would prove admirably adapted to the purposes of illuminating objects usually exhibited by the solar microscope. In the course of a few weeks, subsequently, the illuminating power of rosin gas, and the principle of applying the light of lime to the microscope, were practically demonstrated in a lecture before the Canterbury Philosophical Institution. I believe it was early in the following year that I was informed a patent had been granted for lighting a town on the continent with "resin gas," and every body knows that, during the present year, the "gas microscope" has been brought out as one of the popular exhibitions of the metropolis.

Now I feel convinced, Mr. Editor, that both these plans were originated and carried into effect independently of any thing made public by me; and just as well am I satisfied, notwithstanding the extract previously given, that the principle of generating heat, now made known, is as purely original with Mr. Rutter. Coincidences of this kind have frequently happened, and the more men are taught to think for themselves, the more frequently they will happen, which, after all, is nothing more than another proof of the value of scientific acquirements. Mr. Rutter, I feel persuaded, will not mistrust my motives in offering these observations to his notice: had I not done so, it is very probable some one else would shortly have made him acquainted with the "American Water Burner," and perhaps might unjustly accuse him of plagiarism at the same time.

I am, Sir, very truly yours, W. H. WEEKES.
Sandwich, October 18, 1833.

Mr. Morey, the inventor of the American Water Burner, is now in Boston, improving his invention, which he has already brought to what, on a cursory view, appears to us a high degree of practical utility. The applications of the principle of the invention so far as we have seen them, have been confined to the production of light, in which a mixture of spirits of turpentine and water burnt in a gaseous state is a substitute for oil. The light thus pro-

* Cobbett's English Gardener.

† See N. E. Farmer. vol. vii. p. 354.

duced is clear and brilliant, and is said not to cost more than one fifth part as much as would be necessary to obtain the same quantity and duration of light from common lamp oil.

Editor of the N. E. Farmer.

TO CORRESPONDENTS.

We have received an "Address delivered at the formation of the Berkshire Horticultural Society, by SAMUEL W. BUSH, Esq." together with a copy of a resolve of said Society relative to its publication in the N. E. Farmer, for which we are under great obligations to the Society and to Mr. Bush. We shall commence publishing the Address in our next. We have also several other favors from correspondents, which we consider valuable, and shall as soon as practicable, give each a place in our columns.

ITEMS OF INTELLIGENCE.

Fine Sheep and Hard Times. A correspondent informs us that the ten wethers, mentioned in the Brighton Report as the finest ever seen there, were of the pure Dishley stock, raised on the farm of Thomas Dunn, Esq. of Albany, whose stock of sheep and swine has long been distinguished for excellence; and were fattened at Meadowbanks, Deerfield. It appears by the Franklin Mercury printed at Greenfield, Mass. that two hundred dollars had been offered and refused before they started. At Lancaster the owner rejected another offer of one hundred and fifty dollars. At Brighton the highest bid was one hundred and twenty-five. This is probably the lot mentioned by the reporter of the Daily Advertiser as "the finest he ever saw."

A pair of white steers owned by Mr. Phineas Page of Barnardston were weighed Feb. 25, and their weight including the yoke was found to amount to two thousand two hundred and twenty pounds. They do credit to their feeding.—Greenfield Mercury.

MASSACHUSETTS HORTICULTURAL SOCIETY.

An adjourned meeting of this Society, will be held at the Society's Hall, 81 Cornhill, on Saturday next, at 11 o'clock.
R. T. PAINE, Recording Sec'y.

THE ALBANY NURSERY,

Is now supplied with a large assortment of Pear trees, in addition to its general assortment of Trees and Shrubs, which embraces most of the kinds on demand. Price \$7 1-2 cents. Its collection of *Dahlia*s contains more than 300 fine double varieties, and is surpassed by none in the Union. Orders will be received by GEO. C. BARRETT, at the N. E. Farmer Office.
BUEL & WILSON.
Albany, March 7, 1834. 41.

EARLY POTATOES.

A few bushels Early Potatoes for Seed; the same kind which received the premium of the Mass. Hort. Society, for 4 years past. For sale at the New-England Seed Store, by GEO. C. BARRETT.

10,000 WHITE MULBERRY TREES.

For sale by Abel Nichols, Danvers, 10,000 White Mulberry Trees, of vigorous growth, two years old, and received the first premium of the Essex Agricultural Society. Orders left at this Office, will be attended to. tf. m 12.

TEA SPRING WHEAT.

25 BUSHELS of this valuable variety of SPRING WHEAT, of which a trial of three years has proved it to be a productive kind, not liable to blast or mildew.

There was raised last year 25 bushels to the acre, and being a sure crop, making the best of flour, it is recommended as a superior variety. For sale at the New-England Seed Store, by GEO. C. BARRETT, and also to be obtained of JOHN PERRY, Sherburne, Mass. m 12.

GOOSEBERRIES.

A new importation of superior kinds, just received, of all colors, by WM. KENRICK, Newton.

REDUCTION IN PRICES OF TREES, &c.

WM. PRINCE & SONS have determined in consequence of the pecuniary pressure, to reduce the prices of a great variety of Trees and Plants, where orders are sent for a considerable amount: and all persons who desire Fruit and Ornamental Trees; Flowering Shrubs and Plants; Greenhouse Trees and Plants; Splendid Dahlias; or Seeds—will on applying to them direct by mail, with a list of the articles wanted, be promptly furnished with a printed sheet explaining the reduced rates.—The Chinese Mulberry or Morus multicaulis are now reduced to \$25 per 100, and \$4 per dozen.—Apple trees in great variety \$20 to \$25 per 100.—Pears \$37½ per 100, and extra large ditto 50 cents each; and 50,000 are two, three, and four years grafted.—Peaches \$20 and 25 per 100.—Large Orange Quinces \$30 per 100.—English and Spanish Filberts \$25 per 100.—Fine Red Raspberries \$6 per 100.—Large Red and Yellow Antwerp \$16 per 100.—Gooseberries, finest Lancashire varieties \$20 per 100; and Large Red White and Black English Currants \$16 per 100.—Isabella Grape, 3 years old vines \$25 per 100, and 2 years ditto \$20 per 100.—Catawba, Alexander, Winne, York Claret, York Madeira, and Scuppernon, \$25 per 100.—Hermont's Madeira, Troy and Elsingburgh, \$30 per 100.—Norton's Virginia Seedling \$35 per 100.—The collection of choice European Grapes is unrivalled.—Chinese Ailanthus, 4 feet high, \$4½ per dozen and larger sizes in proportion.—A reduction is made on a great many kinds of Roses, Pæonies, Chrysanthemums, &c.—Double Dahlias of such fine assorted kinds as have been most increased, will be supplied at \$3, \$4½ and \$6 per dozen, according to excellence, and selected by ourselves. The roots can be sent to any distance.—The new varieties of Flemish and English Pears having been introduced by us and greatly increased, the prices of the greater part have been reduced, and the trees are mostly of fine size and three years ingrafted.—The Ornamental Trees and Shrubs of most kinds are large and thrifty, and of double or treble the value of smaller ones, which is a most decided advantage, being a gain of several years in embellishment.

N. B. Having no Agent at Boston, the Commission of 10 per cent. usually allowed for Agency, will be credited to the purchasers, and be deducted from the amount of the bills rendered. The stock of Dahlias being so very large, they will be furnished on the most favorable terms possible.
Linnean Botanic Garden and Nurseries,
Flushing, near New-York, Feb. 10, 1834.

FARM FOR SALE.

On the road leading from Newton West Parish Meeting-House to Waltham Factory, containing from 50 to 75 acres of land, well proportioned into mowing and tillage.—Also House, barn, and out-houses with the same. Said farm is well watered, and has a valuable fruit Orchard.

FARM FOR SALE.

Situated in the South Parish in Andover, little more than half a mile southwesterly from Phillips' Academy and the Theological Institution, and about one mile from the Rev. Mr. Badger's Meeting-house, containing about forty acres of valuable land, being the choice part of a much larger farm—having thereon one large and convenient two story dwelling-house, finished and in good repair, lately occupied as a boarding-house.—Also, near it, a one story dwelling-house in good repair. Also a barn ninety feet long, sheds, wash-house, wells of excellent water, gardens, fruit trees, &c.—A very eligible situation for any person desirous of retiring into a pleasant country town for the purpose of educating his children. The above valuable estate will be sold at public auction on Tuesday the first day of April next, at 3 o'clock P. M. Conditions of sale liberal.
SAMUEL FARRAR.
Andover, Feb. 24, 1834.

SPLENDID DAHLIAS.

The following are a part a list of splendid Double Dahlias which will be for sale, in a few days, at the New-England Seed Store, 51 & 52 North Market Street, by G. C. BARRETT.

Barrett's Susannah; King of the Whites; Le Brilliant; Romulus; Hill's Mogul; Foster's Incomparable; Countess of Liverpool; Queen of Wittenburg; Othello; Globe Crimson; Black Turban; Isabella; Barrett's Favorite, with singular dark foliage; Magnet; Colville Perfecta; Purple of Tyre; Wm. Penn; Melicent; Count Balou; Orange and Yellow Dwarf; Francina; Welles Dwarf Lilac; Rubens; Red Cockade; Trienda Purplea; Bella Forma; Margaretta (splendid) Dwarf Light Purple; do. Red; do. dark Purple; Carmine, dark centre; Semidouble White; White; Woods' Dwarf Red; Gen. Washington; Helianthus Flora; Elizabeth; Cocineæ; Igneus, very scarlet; President Adams; Abundante Flora; Imperial; Scarlet Turban; Eclipse; with all the common varieties, too numerous to mention.

FRUIT & ORNAMENTAL TREES.

GEO. C. BARRETT, General Agent

For all the principal Nurseries, in the vicinity of Boston, will faithfully attend to all orders for Fruit & Ornamental Trees, Grape Vines, Plants, &c. and the same will be delivered in the city, or sent on board vessels, without additional expense.

BRIGHTON MARKET.—MONDAY, MARCH 10, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 275 Beef Cattle, 634 Sheep—(including 134 unsold last week,) 12 pair Working Oxen, 10 Cows and Calves, and 16 Swine.

PRICES. Beef Cattle.—An advance was effected from last week. One or two yoke were taken at \$6. We quote prime at \$5 50 a 5 75; good at 5 a 5 25; thin at 4 75.

Sheep.—We noticed one lot taken at \$3, one at 3 50 a 3 75, one at 4, one at 4, and 19 at \$7 each.

Working Oxen—Ordinary we noticed two sales, \$58 and \$75.

Cows and Calves—A few sales only, viz. \$20, 22 and 30.

Swine—Those at market were sold in one lot at about 5c, all sows.

The famous Leicestershire Sheep which were noticed in our last, ten in number, fattened by Rev. Henry Colman, Deerfield, were sold this day by Ephraim Hastings to Col. Nathaniel Brackett of Newton at \$15 per head.

MISCELLANY.

THE WHITE FLOWER IN THE STAGE COACH.

BY MISS HANNAH F. GOULD.

SHE did not know, when she gave thee me,
How sweet a comforter thou would'st be:
To her pensive friend in the secret need
Which the traveller feels from the tramp of steed,
The wavering couch, and a lonely hour
In a stranger group, my fair white flower!

When the rumbling sound of the wheels was heard
And made me hasten the parting word,
She plucked thee up from thy native place,
While the soul looked full from her speaking face;
And all she felt from the long farewell,
She left for her tender flower to tell.

Thou beautiful thing! 'twas a holy thought,
To give me a work which my Maker wrought;
So pure and perfect to sooth the mind,
In the rattling cage as I sit confined,
While it rolls along in the beaten track,
And my form goes on, but my heart goes back.

I'll cast my mantle 'twixt thee and harm,
From a neighborly skirt, a hostile arm,
Or a cape astray, whose fall, or brush
Thy delicate head might wound or crush;
And then, my small, but eloquent friend,
We'll sweetly commune, to my journey's end.

For HE will carry me safely there,
Who made thy slenderest root his care!
He formed the eye that delights to see,
And the soul that loves to contemplate thee,
We both are the works of his wondrous power;
In silence we'll praise him, my sweet White Flower.

IMPORTANT TO CROWS.

THE Salem Register publishes the following sketch of a debate in the Legislature on the bill for allowing 25 cents for every full grown Crow, and 12½ cents for every young Crow, ("children half price,") which may be killed in the State.

The members took occasion to indulge in a little pleasantry on this subject.

Mr. Ruggles, of Troy, spoke in defence of the character of the Crow. They are the natural scavengers of our Farms—they destroy the enemies of our corn fields, and do much more good than harm. He was always glad to see them. He was himself a farmer and raised 300 bushels of corn a year. He always prevented any one from killing the crows, and frequently scattered half a bushel of corn about to feed them. He should be as willing to pay for their services as for any of the laborers upon his farm. He moved to strike out the enacting clause of the bill.

Mr. Greenwood, of Hubbardston, (Chairman of the Committee which reported the bill) defended its provisions, and spoke in a disrespectful manner of the character of the Crow. Every farmer, he said, knows they are great depredators, and some are injured to the amount of 30 or 40 dollars a year. He thought something should be done to encourage their destruction.

Mr. Forward, of Belchertown, thought there were other birds and animals as bad as crows, and ought to be destroyed just as much. There was the *Chevrink* and *Chipmuck*—they too visit our corn-fields. But he would ask any liberal minded man if he would grudge a kernel of corn to a poor *Chipmuck*, when he sees him sitting hour after hour, with tears in his eyes, longing for something to eat? If any gentleman raises so much corn as to lose 40 dollars worth a year by the crows, he

can afford to hire a man, and find him powder and shot to protect it. If the crows are killed, twice the number would come to bury the dead.

An old farmer in the gallery said he at first thought this a small subject to legislate upon, but he was now in favor of doing something against the crows. He has known them to pluck out the eyes of little lambs! Would gentlemen let an animal that would do such a deed, go with impunity? As to *Chipmucks*, they could not fly, and small children could set squat traps and catch 'em; there is no need of a bounty for them. Gentlemen must possess a very liberal spirit, as well as a great abundance, if they are willing to give corn to such a pernicious tribe as the crows.

A member moved a re-commitment, to add *chipmucks*, *chewinks*, *caterpillars*, &c. to the bill.

Mr. Forward never knew crows to pick out lambs' eyes, but he didn't doubt the word of the gentleman in the gallery, for he once travelled in his part of the country, and upon his word he didn't believe there was corn enough raised there for the Crows to subsist upon!

Mr. Darling, of Marblehead, said he once knew a corn field destroyed by a swarm of *Rats*—he thought they ought to be included in the bill, and that it should specify at what age they should be considered *Young rats* or *Old rats*!

Mr. Forward said—the bill didn't point out the size or weight which constitute a "full grown Crow."

An elderly member asked whether the bill was to apply to the city of Boston?

Mr. Greenwood replied that it would not—no Crow was ever seen in the city except a certain "*Jim Crow*," and he had no idea of shooting him!

Mr. Ellis said, there was a member of this House the last year by the name of *Crow*! He certainly would come under the denomination of a "full grown Crow," and he saw no provision in the bill which would protect him!

The House having been amused for an hour by this crow shooting project, and the proposition having been sufficiently ridiculed, the question was taken on striking out the enacting clause of the bill, and carried in the affirmative by a very large majority.

From the *Getesee Farmer*.

TO KILL RATS OR CROWS.

"BRUISE half an ounce nux vomica and soak 24 hours in warm water; then add 4 quarts corn and soak it 12 hours; then sow the corn on the ground immediately after planting."

The above was taken from a paper some years since, and after trying corn soaked in arsenic without success, I tried the above; and early the next morning after sowing it, I found a crow on the ground, stupid; but on putting him in a cage he revived, and I put him in the field, and confined him to a board by tying his legs on the under side, after boring two holes to put his feet through; and immediately the air was black with crows, but no one ventured to disturb the corn. I should recommend to increase the quantity of nux vomica, that the effect may be more certain. For rats it should be mixed with meal, and put where the hens cannot get it.

It is impossible, says the learned Bishop Taylor, to make people understand their own ignorance, for it requires knowledge to perceive it, and therefore he that can perceive it hath it not.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, &c. &c. and covers the most of 18 acres. Of new celebrated *Pears* alone, 130 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus MULTICAULIS* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnut. Weeping Willows, Catalpas, Mountain Ash, Silver Fir, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the *Peonies*, *Montan* and *Papaveracea*—and 24 other kinds—and 63 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with Geo. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application.

ADDRESS

DELIVERED AT THE FORMATION OF THE
BERKSHIRE HORTICULTURAL SOCIETY,
*Lenox, Oct. 31, 1833.....*By SAMUEL W. BUSH.

MAN is the minister and interpreter of Nature. This was the definition of an eminent philosopher; and although it may be correct as applied to himself, yet when considered in reference to the vast majority of the human race, it is wholly without meaning. How very few, even in this day of intellectual light, are acquainted with the elementary principles of the several branches of the Science of Nature! Still less is the number of those who have a profound knowledge of the laws which control the stupendous and splendid mechanism of the Heavens; of the multitudinous and astonishing phenomena of animal and vegetable life, and of the amazing and complicated operations of mind. Even they who, with unquenchable ardor, have devoted the whole of their energies to the study of Nature, whose names stand first among the great men of the earth, have with bitter humility declared that their attainments were puerile and contemptible—that the great Ocean of Truth lay unexplored before them. Every person, indeed, by the necessities of ordinary life, has his attention so strongly fixed upon the contracted surface of his particular interests, that he is prevented from observing, with an eye of intelligence, the phenomena of life that daily passes before him. Generations successively come forward, almost wholly ignorant of what has preceded them, and entirely destitute of the means of knowing what is to follow them.

Ignorance and Superstition have erected their altars in every nation of the earth—we might say, in the heart of every human being. Under their iron despotism our world has become, if not a den of thieves, at least the theatre where Doubt, and Lust, and Ambition, and Atheism, and Folly, have been the stirring and fearful actors. The history of our race is but the record of their performances. There have been no intervals between the acts of their terrible tragedies. Acting in concert and continuously, they have made hideous sport for the “dogs of War.” They have alternately intoxicated, corrupted, oppressed and destroyed nations, exultingly blending the tones of their terrific chorus with the despairing groans of the crushed souls of their remorseful and miserable human victims.

These same subtle and overpowering spirits, that animated and blasted the forms of the countless myriads that have melted away in earth’s mighty sepulchre, are at this moment riding forth conquering and to conquer. Of this age it will be recorded, that two thirds of its inhabitants lived and perished in the thick darkness of heathen ignorance; that War, and Crime, and Misery had their untold victims, even in those climes which were illuminated by the light of civilization; and that although the sun of Christianity had extended its beneficent rays into the heart of almost every nation, yet that the conduct of multitudes of its professed believers manifested that these master spirits of evil secretly controlled their springs of action.

To come down to our own community, confessedly equal in point of intelligence and virtue to any in the world, how many there are who are utterly ignorant of themselves; of the economy of

nature; of even the principles of the government under which they live. How few among us endeavor to think justly and to act wisely upon these points! Wavering, uncertain and fickle as water, the majority are ready to embrace or to renounce any doctrine, or to adopt any expedient that has only self for its object. Although, like the Egyptian idolaters, they have not erected temples for the worship of bulls and crocodiles, yet the gods of their worship are not less absurd and unavailing. The phantoms, Ambition and Wealth, glitter in their fancy with the sunbeams of happiness, and they pursue and worship them with breathless ardor. Baffled and disappointed, they nevertheless urge onward, plotting and counterplotting, and though many faint in the race, and are crushed, and are given over to misanthropy and remorse, yet neither sharp Experience nor sober Philosophy can persuade them to forsake the impalpable delusions they madly worship. Hence, we see among us, hungry competitors for the paltry distinctions of an hour; hence, trucklers for popularity; hence, usurers and misers; hence distrust, discord, jealousy, and embittered rivalry, ill concealed under a seeming courtesy of demeanor. Indolence, too, is a god that hath its worshippers. Encrusted with a love of ease, and with souls mildewed by indifference and contempt of the gifts of God, its votaries float lazily along, unstirred by one healthful influence, until they sink into the lake of Death, a libel upon their species.

Comparatively, we are enlightened and christianized. Are we so, in full reality? Who, but the declaimer for votes and office, will say it? Alas, there are many plague-spots on the body politic. We are not so visionary as to suppose they can ever be entirely removed by human agency. They are hereditary, and form an integral part of humanity. Homebred encomiasts inform us, that they are eradicated, so far as our “happy country” is concerned. Let not our self-complacency be excited by these gilded flatteries. It is true, the clouds have partially separated that intercepted the benign and diffusive light of knowledge, and by its kindly influence the Arts and Sciences have been advanced, and with them a better and higher standard of morals. But while we rejoice with our whole heart, at what has been done, let us not forget that there are Herculean labors yet to perform. Our own passions must be subdued, our own minds should be enlightened, before we attempt to subdue and enlighten others. Let our pride and exultation be checked by a survey of the actual poverty of intellectual wealth which every where is visible. And he is truly the noblest benefactor of his race, who succeeds in convincing them of their ignorance; in overcoming inveterate prejudices; in dissipating superstitious dogmas; in withdrawing their affections from the vain and perishing baubles of Gain and Glory, and placing them on things imperishable, that communicate perennial and ever new delight.

The Science of Nature should engage man’s earnest and unwearied study; for it emphatically addresses itself to his understanding, his feelings and his necessities. It forms the most comprehensive and interesting object of human inquiry. It opens to contemplation a countless number of ob-

jects, material and intellectual, and the diversified relations and affinities which subsist between them. It is the golden key that opens the way to surpassing beauty, utility, and never-cloying, never-ending delight. The earth, the air, the waters, with their boundless number of species and varieties of animal and vegetable life—the mind of man, with all its brilliant creations and all its inherent energy—“the firmament of heaven—the planets that move around our system—the smallest of the atoms that float around our globe, and the most majestic of the worlds that roll through the illimitable fields of space,”—these are the objects that present themselves to our observation; and they are in themselves so beautiful, so diversified, so innumerable, so perfect, their arrangements are so harmonious, their combinations so wonderful, that the mind when once engaged in their study becomes insensibly attracted by their manifold fascinations. It is man’s peculiar prerogative, it is his highest delight, it is his soundest philosophy, to study and contemplate the works of the Creator. It is by this, by the discovery and application of the unerring laws of nature that his well-being here is secured, that the sphere of his observation is infinitely extended and his enjoyments infinitely multiplied—that fears and errors, engendered by Superstition and Ignorance, are dissipated—that his soul is expanded and elevated—that he is capacitated for occupying a loftier and more noble position among the intelligences of God. “In the study of nature,” saith an eloquent naturalist, “we tread in the footsteps of wisdom. We listen to a voice, which is the same yesterday, to-day and forever. And while the erring and fluctuating opinions of man, his crimes, his follies, his power, pass away and are forgotten, the empire of nature is immutable, to us eternal—the knowledge of nature which is once accurate, is forever true—the knowledge of nature which is once perfect, may be forever useful.”

To the undistinguishing gaze—to him, whose mind is, like the pearl incarcerated in the shells of the ocean oyster, bound in ignorance,—the visible world appears to be a mass of inextricable disorder. He can perceive in it nothing like beauty, utility or wisdom. The condition of such a mind is pitiable indeed, but there are millions of such. Man fulfils his destiny by attaining knowledge—he was designed to be the minister and interpreter of nature. We have seen how very inadequately he has performed the duties of his sacred office; and the mass of men have yet to learn, that if they will but study, if they will but observe, if they will but reflect—if they will but ascertain the powers and properties of the mind, its capacities, its aspirations, its peculiar and divine structure—if they will but go up to the study of nature with the docility of a little child, and learn from her the lessons of wisdom,—they will be guided by the light of Truth to elevating and sublime enjoyments, and ultimately to that Heaven, where the mind, unobstructed and free as the winged winds, will forever expand with the knowledge it will acquire of the spiritual and material creations of an almighty, benevolent and eternal JEHOVAH.

From these broad and general, and imperfect, views, let us turn our attention to that branch of

Natural Science which relates to Vegetable Physiology or Botany. It would require a volume to contain a list of the names of the several species of plants which have been discovered, for they are not less than 100,000, and volumes to describe their properties, their uses, their peculiar and excellent organization. It would be idle therefore, and absurd, to attempt to discuss the subject at large. The broad and beautiful book of Nature is open to you all, and there are a multitude of manuals, the works of patient investigators, that will aid you in decyphering her wonderful mysteries. For the present we can only dwell, briefly, on a collateral branch, viz. *Horticulture*.

(To be concluded in our next.)

NEW WORK.

LILLY, WAIT & CO. and GEO. C. BARRETT,
121 WASHINGTON STR.—51 & 52 N. MARKET STR.

Will Publish this Month the First Volume of

THE COMPLETE FARMER AND RURAL ECONOMIST,

Forming a Compendium of the most important
Branches of Agriculture and Rural Economy.

BY THOMAS G. FESSENDEN, ESQ.
Editor of the New England Farmer.

THE Editor and Publishers have been induced to offer this work to the Public in consequence of the great and increasing demand for information on the subjects which it is intended to embrace, with a hope that it may prove useful to the Agricultural and Horticultural community, in whose pursuits all mankind have a direct and obvious interest. It is intended to form a Compendious Directory to the Farmer, Gardener, Florist, and Rural Economist, and to be so arranged that every article may be readily referred to.

VOLUME I.

The First Volume will be devoted to AGRICULTURE, in its various branches, embracing the following among other topics:

| | | |
|---------------------|---------------------|----------------------------------|
| <i>Soils,</i> | <i>Manures,</i> | <i>Dairy,</i> |
| <i>Grasses,</i> | <i>Hemp,</i> | <i>Sheep,</i> |
| <i>Grains,</i> | <i>Flax,</i> | <i>Swine,</i> |
| <i>Indian Corn,</i> | <i>Neat Cattle,</i> | <i>Poultry,</i> |
| <i>Wheat,</i> | <i>Horse,</i> | <i>Woodland, &c. &c.</i> |
| <i>Fences.</i> | | |

VOLUME II.

The Second Volume will be devoted to HORTICULTURE, in its various branches; also, SILK, BEES, RURAL ECONOMY, &c. In this volume, the following will be among the number of topics embraced in the treatise:

| | | |
|------------------|------------------|------------------------|
| <i>Garden,</i> | <i>Hot Beds,</i> | <i>Insects,</i> |
| <i>Orchards,</i> | <i>Mulberry,</i> | <i>Rural Economy,</i> |
| <i>Fruits,</i> | <i>Silk,</i> | <i>&c. &c.</i> |
| <i>Vine,</i> | | |

To each volume will be added a list of the best Implements in use, and drawings of the most important and improved kinds will be given.

CONDITIONS.

The work will be comprised in two volumes, royal 12mo. of 350 pages—price \$1 a volume;—and either volume may be had separately, as they will be entirely independent of each other.

Subscriptions solicited by LILLY, WAIT & Co. 121 Washington street, and GEO. C. BARRETT, Publisher of the New England Farmer, Nos. 51 & 52 North Market Street, Boston.

GARDENING.

God Almighty first planted a Garden; and indeed it is the purest of human pleasures: it is the great refreshment to the spirits of man; without which buildings and palaces are but gross handy-work.—*Bacon's Essays*.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF GREENHOUSE PLANTS AND FLOWERS.

Saturday, March 8th, 1834.

M. P. WILDER, Dorchester, *Camellia japonica*, var. *Woodsi*, *Knightii*, *aneione flora*, *Striata*, *Rosen*, *Atropurpurea*, *Kew blush*, *Alba plena*, *Oxalis rosea*, *Polyanthus* (hose in hose).

THOMAS MASON, Charlestown, *Mathiola simplicaulis*, *Mathiola incana*, *Cineraria populifolia*, *Illicium floridanum*, *Camellia japonica* (seedling), do. *Haggerstonii*.

Messrs. HOVEY & Co. variety of Flowers.

Messrs. WINSHIP, *Azalia alba*, *Teucrium fruticans*, *Primula auricula*, &c. &c.

By order of the Committee,

JONA. WINSHIP, *Chairman*.

FRUITS EXHIBITED.

Seedling Apples, medium size, striped red and yellow, past their prime, by L. ELLIS, Franklin.

Seedling Apples, rather above medium size, striped red and yellow, past their prime, judged to have been a good apple at maturity; the Committee agreeably to request, call this the *Summer Apple*, it having originated on a place owned by a gentleman of that name in Foxborough; by Dr. R. GREEN, of Mansfield.

Conway Apples, originated in Hamilton, Essex county, yellow and green, with some red spots, above medium size, juicy, rich and fine flavored, approaching a sweet; by R. MANNING, Salem.

Hickory Nuts of the largest size, from Illinois, by

Preserved Citron, from melons raised in this vicinity, fine flavored and delicate, differing materially from the imported, by Messrs. HOVEY & Co. Seedsman.

For the Committee,

B. V. FRENCH.

EXHIBITION OF GREENHOUSE PLANTS AT THE MASS. HORT. SOC. ROOMS.

Saturday, March 15th, 1834.

THOMAS LEONARD, from the Conservatory of the Hon. JNO. LOWELL, *Acacia arisata*, and other elegant plants.

THOMAS MASON, Charlestown Vineyard, *Acacia armata*, *Camellia atropurpurea*, two seedling *Camellia japonica*.

M. P. WILDER, *Camellia japonica*, do. var. *Chandlerii*, do. do. *Wardii*, do. *Variegata*, do. *Alba plena*, do. do. *Loddige's red*, do. do. do. *Carnea*; and an unknown variety, first time of flowering, and supposed to be a seedling.

By order of the Committee,

JONA. WINSHIP.

FRUITS EXHIBITED.

Apples. Newton Pippin—in point of flavor we know of no apple that will excel this, at this season of the year; by Messrs. WINSHIPS, Brighton.

A handsome specimen, past eating, name unknown; from E. W. BULL, Esq. Hartford, Ct.

Grapes. Isabella grapes, in a fine state of preservation, in external appearance, flavor vitiated; by Mr. THOMAS HASTINGS, East Cambridge.

Scions of the Seekno further Apple, from Mr. JAMES LINCOLN, Hingham; and the Hodgkins Apple, from Mr. Webster of Haverhill, were received and distributed.

For the Committee on Fruits,

B. V. FRENCH.

MASSACHUSETTS HORTICULTURAL SOCIETY.

At the meeting of this Society on Saturday last, it was voted that all subscription members hereafter elected, and who at the time of their election reside more than twenty miles from Boston, shall, by paying an admission fee of seven dollars, be afterward exempted from the annual contribution,—as also shall hereafter be, those of such members already elected, who shall have paid, or shall pay the annual contribution up, to the present time.

Mr. WILLIAM STEARNS of Boston, and Mr. NATHANIEL H. BISHOP of Medford, were elected subscription members, and the meeting was dissolved.

From the Northampton Courier.

DOMESTIC ECONOMY.

THERE are some simple questions in domestic economy, which are worthy the attention of all our farmers and agricultural men. They relate immediately to the importance of possessing good stock, and valuable species of animals, which appear to excite but little attention in most agricultural communities. Cows which yield only their ten quarts of milk per day to one man, are certainly much less productive than his neighbor's animals, which perhaps, with the same expense in labor and keeping, yield him his twenty quarts. The profit of two dairy farms, where the relative difference between the animals is in such striking disproportion, would astonish every individual when ascertained at the termination of the year. Yet this is hardly an imaginary case. Regardless of considerations like these, a large number of poor, comparatively worthless animals are kept by our farmers, who cannot be impressed with the great importance of substituting better and more profitable beasts in their stead.

But sheep husbandry will illustrate this principle more fully. A. has a flock of eight hundred Saxony or Merinoes, which yield four pound at each shearing, making the product of his flock 3200 pounds annually. At the price for which wool is now selling in Boston, say 75 cents, the proceeds of A.'s sheep would be \$2400; B. his neighbor, has an equal number of sheep, though of an inferior quality, but requiring the same food and attendance as A.'s. They will yield perhaps 3 pounds to a fleece, giving annually 2400 pounds. This sort of wool at 40 cents, the present price, will yield B. \$960, making a difference of \$1500 between the productive character of A. and B.'s sheep. Now it is one of the first principles in political economy to obtain from the smallest surface of soil or specific number of animals, the greatest amount of grain. By comparing the products of the two flocks of an equal number owned by A. and B. is not the difference, to a discriminating mind, most astonishing?

The above simple exposition of the profits on Cows and Sheep of different kinds, will apply with much the same force to all animals kept by farmers. An experienced individual, who is intimate with the details of raising sheep, suggests to us the absolute importance that they should be kept well. Indeed the same remark applies to all animals, from whom profit in the shape of periodical produce is expected. Cows from an insufficiency of food, or that of an inferior quality, deteriorate both in kind and quantity of their milk, which surely is wretched economy, and Sheep, with inferior food and but half enough of it, not only

diminish most sensibly the amount of wool they yield, but they are unable to sustain their lambs, and the natural consequence follows, they die.

BUTTER.

A FRIEND waited on us, yesterday, to communicate the result of a process, which had been recommended to him, of restoring butter to its original sweetness. Incredulous as he was, he made the experiment, and he authorizes us to say it was entirely satisfactory. It consists simply of churning the butter with sweet fresh milk, in the proportion of about 2 lbs. of the former to half a gallon of the latter. Butter, thoroughly rancid, by this simple process, was rendered sweet and good. Our citizens, in view of the present scarcity and dearth of butter of even tolerable quality, will not fail to appreciate this discovery.—*Fredericksburg Arena.*

HOT BEDS.

In this latitude a hot bed is almost indispensable with those who would have good gardens. There are many plants cultivated in gardens, which, in order to receive the greatest benefit from them, require a little forcing, by which they are brought to greater perfection than they would arrive at if planted in the open ground.

Early cabbages should be brought forward in this manner, as by it they may be brought to the table one month sooner than when the seed is sown in open ground.

Tomatoes and peppers are more productive when brought forward in beds; besides, to have tomatoes, during mid summer, not only pleases the appetite, but is conducive to health.

Cucumbers, melons, and squashes may be started in hot beds, and afterwards transplanted to the open ground with advantage, as some of the finest varieties of melons do not ripen sufficiently early to have them in perfection, unless they are brought forward in this manner.

We would not recommend planting hot beds in this vicinity until the middle of March; but the manure for them should be collected and put in a heap, that the fermentation may commence before it is put into the bed, otherwise they are liable to become so hot as to destroy the young plants.

Sufficient directions for the formation and management of hot beds will be given in due season, to enable those unacquainted with the business to be sure of success.—*Goodsell's Farmer.*

PAINTING OF BUILDINGS, &c.

For painting the roofs of buildings, Mr. Patterson, of New Jersey, has, some years since, given the following directions, which have been highly approved, as the best composition known for preserving the roofs of houses; as it is found, that it hardens by time, and is an effectual preventive against the roof taking fire from the sparks of the chimney.

"Take three parts of air slacked lime, two of wood ashes, and one of fine sand; sift these through a fine sieve, and add as much linseed oil as will bring it to a consistence for working it with a painter's brush. Great care must be taken to mix it perfectly."

We believe grinding it as a paint would be an improvement. Two coats are necessary; the first

rather thin; the second as thick as can be conveniently worked.

Painting of wooden buildings, of every kind, is not only ornamental, but the owner is well repaid for this extra expense, by the greater durability which the paint gives to them. The wooden fences also, which are intended to be ornamental, round, and near buildings, should never be destitute of a good coat of paint.—*Farmer's Assistant.*

BEST TIME FOR CUTTING TIMBER.

THE best time for cutting timber involves an inquiry of deep interest to farmers. Last summer we received the following notice of this subject in a letter from a valued correspondent:

"Some years ago, a German on the Tohickon, cut hoop poles late in the spring; and a bundle was accidentally left in the woods lying on the ground. It remained there a year or two before it was discovered, and then to his surprise found to be untouched by the worms. The poles were ash, hickory, and maple. He has since had his timber for rails and other purposes, cut at that season of the year, and I have also successfully tried the experiment."

We did not clearly understand at the time whether the hoop poles were preserved by *lying on the ground*, or by *being cut at that season*; and we wrote for an explanation. This we have just received, and are pleased to lay it before our readers:

"The hoop poles left in the woods were preserved from becoming *doated* or worm eaten, in consequence of having been cut *late in the spring*, at the period when the sap is elaborated in the full grown leaf. A sawyer told me that logs cut when the bark first begins to peel will soon become *sap rotten*, while others cut only a few weeks later, will remain sound in similar situations. Ash, hickory, and maple, when cut at the wrong time, are very liable to be worm-eaten."—*Genesee Farmer.*

CUT FLOWERS.

To more conveniently enjoy the sight of flowers, they are often plucked and placed in jars of water in the dwelling. By changing the water, or adding alkalies every day, they may be perpetuated without fading for many days, even to the period of falling from the parent stem. Lime, magnesia, or soda, may be used in moderate quantities, such as to give natural sustenance to the detached shoots in preservation. They may be made a luxuriant and appropriate ornament to the drawing-room or parlor; and in the more humble dwelling of the laborer, how cheerful appears the white-washed room and broad fire-place,

"Whose hearth, except when winter chills the day,
With aspen boughs, and flowers, and fennel gay,"
throws out its soft perfume to the air.—*Ulmus.*

From the Genesee Farmer.

FENCE POSTS.

In a late number of the Farmer, I recommended the cultivation of the locust, believing it to be the most valuable timber for fence posts. Since I penned the article, I have reflected much on the subject, and have been led to the conclusion, that by the use of strong alkalies, several kinds of timber abounding in our country may be rendered durable in the ground.

An intelligent farmer of Cayuga county informed me, that when he entered on his farm, about

thirty years ago, there stood on it a building which had been used as a potashery, and against which lay a large quantity of leached ashes. On removing it, within a few years, he found that one of the posts, on the side next the ashes, was of *bass-wood*, and, to use his own expression, as sound as when put in.

In building our fine packet ships, the spaces between the timber and ceiling and outer plank, are filled with salt, it having been ascertained that it has the effect to render the wood imperishable. In an article, page 91 of 1st vol. of the Farmer, it is stated that the Shakers at Union Village, have been in the habit of making oak posts as durable as locust by a very simple and easy process. This is merely to bore a hole in that part of the post which will be just at the surface of the earth, with such a slope as will carry it just below the surface and fill it with salt.

With the exception of the red cedar, which is found on the islands and shores of our lakes, we have no timber that will remain sound in the ground many years, unless measures are taken to neutralize the acid contained in the wood, in the part buried in the earth. It appears, by the above statements, that the ley of wood ashes, and salt, have that effect; and we have reason to believe that lime would answer the same purpose. But which will answer best can only be ascertained by experiment. Quere—Does not the ley, salt, and lime, drive out and occupy the place of the natural moisture? I believe it to be a fact well established, that seasoned posts are more durable than green ones, and I conclude the reason is, that there is much less of the acid remaining.

I will now propose to the readers of the Farmer that those of us who have leisure and opportunity should make the following experiment. Procure sound oak, chesnut, or white cedar posts, and when they are well seasoned, divide them into three parts. Of that part to be put in the ground, let one-third be immersed in strong ley, one-third in strong brine, and one-third in lime water, for a sufficient length of time to neutralize the acid. Or if this be attended with too much trouble, set one third with leached ashes to within six inches of the surface, then strong ashes, let one third have salt applied as done by the Shakers, and the other third be set with lime from the surface to the depth of six inches, for it is at the surface of the ground that the posts decay. By such an experiment, in addition to the benefit to ourselves, we should have the pleasing reflection that we have rendered one to the country at large.

I should be sorry if the above suggestions should divert the attention of any of our farmers from the cultivation of the locust, my only object in penning this being to inform them how to supply themselves with durable posts until their locusts shall have attained a proper size.

Several writers for the Farmer have asserted that posts last much longer if the end which was upwards when growing be put in the ground. I consider this worthy of further experiment.

ONTARIO.

ANIMAL LIFE.

A HARE will live ten years, a cat ten, a goat eight, an ox twenty, swine twenty-five, a pigeon eight, a turtle dove twenty-five, a raven one hundred, an eagle one hundred, and a goose one hundred and fifty.—*Amer. Farmer.*

*From the Northern Farmer.***ROTATION OF CROPS, POTATOES AND CORN.**

ROTATION of crops, is certainly among the most valuable of the modern improvements in agriculture. The scientific researches of many farmers have enabled them to discover some of the principles of vegetation, formerly but little understood. And it is believed that they will generally soon be fully convinced by experiment of the great benefits to be derived from rotation of crops. The different kinds of vegetables require nutriment peculiar to each class, and by planting the same kind on the same soil for a number of years in succession, the vegetables or plants degenerate for the want of their peculiar aliment; or as the common expression is, the soil becomes exhausted. It is therefore conceded to be an injudicious practice to cultivate the same crop, upon the same soil, for even two years in succession.

The same remark is applicable in horticulture; although a plentiful supply of manure annually, may afford some remedy for a previously exhausted soil.

By a judicious succession of crops, and the frequent use of that most important instrument to farmers, the plough, the fertility of the soil may be maintained in a progressive state of improvement. So many valuable essays have of late been published upon this subject, that we will not extend our remarks; but beg leave to refer to that of J. Hamilton Couper, republished in the *Northern Farmer* of 9th March 1833, as containing much valuable information, and as being worthy of an attentive perusal. Connected with this subject is the adaptation of the different soils to the various kinds of plants. Many skilful farmers acquire some practical knowledge of this subject, without understanding its true principles. Indeed, these principles cannot be well understood without the aid of the science of Chemistry. Chemical Science is indispensable to the Physician; but it falls not exclusively within his province. The practical farmer will find it of vast service in his pursuit. Its study ought therefore to be encouraged.

By ascertaining the food which different kinds of vegetables require, and the nutritious qualities of the various soils, the agriculturist is enabled to decide how he can, generally, produce the largest crops, with the least labor and expense.

He cannot have sufficient foresight to guard against unpropitious seasons; but acting upon enlightened principles and correct theories, his prospects of a good harvest will seldom be cut off. Our present object is to submit a few remarks upon two of our most essential agricultural products, potatoes and corn.

In this section, we raise no vegetable of greater profit or more general use than the potato. And its annual consumption seems to be yet on the increase. We learn from aged persons, that some fifty or sixty years ago ten or fifteen bushels of potatoes were considered as a large crop for each farmer; and at that period, it was as uncommon for a slaughtered swine to weigh 250 lbs. as it now is, to weigh seven or eight hundred.—Now, a thousand bushels of potatoes, or even fifteen hundred, is not an uncommon crop, upon a farm of one hundred and fifty or two hundred acres.

It has been believed by many, that high, sandy, or gravelly soils are best adapted to the growth of potatoes. But the modern theory, proved by experiment is, that a low cold bottom, or clay-pan, is preferable. I have for several years cultivated

this vegetable upon a low, level, clay-pan, taking care to have proper drains in case of heavy rains; and find that it not only yields largely, but that the quality or flavor of the potato is superior to that of those produced on high sandy soils. A cold bottom is more congenial to them. And it is generally known, that in a cold, wet season, they flourish better, than in a warm and dry one. But when planted in low lands, the drains should always be kept open, to prevent overflowing.

It is said that in some parts of Ireland, famous for excellent potatoes, the potatoes are planted in low and boggy lands, in beds, between which a ditch or drain is cut; and that the mud or most nutritious portion of the soil which gradually collects in these ditches, is taken up to cover the potatoes. The practice, which many farmers are adopting, of laying out their low and marshy lands into beds rising in the centre, of four or five rods in width, with intervening drains, running towards a common outlet, will prove highly beneficial; and when there shall be a great increase of population, and the value of our lands shall be greatly enhanced, this practice will be adopted by all good farmers. It will then be admitted by all, that our valleys, and swamps, contain the most fertile soil. In these, have been collecting for ages, decomposed vegetable matter, which constitutes the deep black soil. This kind of soil, conveyed on to high sandy barren land, with a mixture of animal manure, will convert the latter into fruitful fields. And the fertility of the low land is increased by spreading upon its surface loose sand or gravel from the hills.

The old practice of making the potato hill in an oval form or the shape of a sugar loaf, is very censurable. The same remark is applicable to the corn hill. Because, hills so formed do not absorb so much moisture, when the rains descend, as hills flat at the top.

It is believed that a former practice of planting small potatoes, is now universally condemned. But many are yet of opinion, that it is as judicious to plant cut potatoes, or slips, or the eyes, as whole potatoes. This practice is contrary to the course of nature. Nature is always right, in all her operations. The Farmer should take nature for his great and unerring guide. Hundreds of various theories have been published upon this important point. The result of our observations and reflections respecting it is, that it is always best to plant the best potatoes whole, except those containing too many eyes, of unusually large size. The latter may be divided. I raised a potato, perfectly sound, of an oval form, weighing two and one half pounds. This I cut into twelve pieces, which from twelve hills, yielded two bushels. If slips are planted, the plants or sprouts come up more slender, and feeble. In favorable seasons, they may often yield very well, but not so well as those from the whole potato. Care should be taken to prevent the growth of too many sprouts or stalks. Four or five in a common hill are sufficient. The size of the potato depends very much upon the number of stalks, and the size as well as richness of the hill. Potatoes degenerate by means of an improper mode of cultivation, and not from the climate. This vegetable of inestimable value contributes most to the health, growth and fatness of cattle, after being boiled, or steamed. It ought never to be given to swine in a raw state, unless, possibly, in the warmest season of the year, after being partially dried.

The common practice of mutilating corn stalks, or "topping corn," before the ear has come to maturity, ought to be condemned. It may be difficult to account for the origin of so singular a practice. But we trust that its termination will not be at a day far distant. It stands opposed to reason and philosophy. But our suggestions upon this important subject must be deferred until a more convenient time.

W. CLAGGETT.

Portsmouth, Feb. 19, 1834.

TO MAKE A FARMER.

THE celebrated Marshall said that "attendance and attention will make any man a farmer." He was brought up to commerce and did not give any attention to farming until a mature period of life. He then took a worn out farm of 300 acres near London. In three months he dismissed his bailiff, and performed, by the aid of study and practice, the duties of his office himself. He kept minutes of his operations, and published those from 1744 to 1777. He was acknowledged to be superior to most of his contemporary farmers. Arthur Young, too was brought up to commerce. Middleton, in his view of the Agriculture of Middlesex, says one of the best farmers in that county was a retired tailor. The reason why those who have been brought up to other professions often make excellent farmers is that they have a real taste for agriculture, and enter it with a zeal to which those who have been brought up to it from infancy are strangers. Bakewell's advice to young farmers was "to see what others are doing," or in other words, to read what others are doing.

MARCH.

THE month of March is to the farmer, what a few hours preceding the battle is to the soldier—a time to put every thing in readiness and prepare for action, and the one who neglects to improve it is like the soldier; he loses that which he might have gained, had he been prepared.

During this month, the prudent farmer will see that all his implements of husbandry are repaired and in readiness for the spring and summer's campaign. As this month is one in which we are to expect many storms, it gives an opportunity to attend to many of the cares of agriculture, which can be done within doors, when the weather is unfavorable for field labor.

During this month the multiplication of farm stock of every description, demands unceasing care. Colts, calves, lambs and pigs, are to be looked after, and even turkeys, geese, ducks and hens, pay well for close attention during this month.

Seeds for every kind of spring crop, should be prepared and the quantities of each ascertained.

Timber for rails, or other purposes, when durability is desirable, if not already cut, should be felled soon. Fire wood should be cut and piled for the coming year.

Cions for grafting should be cut and put in a cool place, before the buds swell too much.

It is customary to prune orchards during March, but this had better be omitted until May.

The Roller is an instrument which should be ready for use this month. All mowing grounds are benefited by being rolled in the spring while they are soft. Wheat also is greatly benefited by being rolled as soon as the state of the ground will permit.—*Goodsell's Farmer.*

From the New York Farmer.

THE SCIENCE OF AGRICULTURE.

MR. WHITAKER, in his address before the South Carolina Agricultural Society, thus speaks of this subject:

It is impossible that a Science, whose basis is so firmly fixed in nature, and which covers so wide a surface of social interests, should fail hereafter to awaken the attention, enlist the talents, and urge forward the enterprise of the most gifted intellects in the promotion of its great objects. It is impossible that a Science, of all Sciences the most useful and interesting to man in his present state—a Science which dates back its origin from the first dawn of civilization, of which, in fact, it has been every where the precursor—a Science which has converted savages into useful citizens, and caused even “the desert to rejoice and blossom as the rose”—a Science which has actually engaged the attention of seven-eighths of the members of the human family, from the earliest period down to the present day, either to its elementary principles or to their practical application—a Science, over whose interests even the heathens thought it necessary that a distinct and special Deity should preside—a Science, whose praises have been sung by poets and chaunted by orators, and in whose details kings have been willing to engage—a Science which constitutes the basis, the substratum, the main stock of many other sciences, which can be properly viewed only as shoots or branches from it—a Science which is the great, the inexhaustible source of wealth, happiness and refinement, both to nations and individuals, and whose triumphs are daily witnessed, and whose blessings are sensibly felt and appreciated, by every cultivated people in every habitable clime—a Science which feeds us and clothes us and cheers us—

“Whose streams from ev’ry quarter confluent, form
My better Nile, that nurses human life.”

It is impossible, I affirm, that a Science so valuable in itself, so diversified in its relations, so controlling in its influence, so important in all its results should not, in an enlightened age, and in a free country, excite a far greater degree of attention than it has hitherto awakened, and command a far higher proportion of respect than it has hitherto claimed. From a variety of causes, this Science has now become so intimately associated with the most thrilling and engrossing interest of life—a knowledge of it is so essential to improvements and prosperity in the manufacturing and mechanic arts—it enters so fundamentally into the prospects and success of every commercial enterprise—it contributes so largely to the amount of domestic peace and public happiness and national glory—it is so closely bound up and involved in the consideration of all great political questions, that as it already begins, as might be expected, so it will continue hereafter, to press itself upon the notice of intelligent men of all ranks and professions, in a tone so loud and clear that it will be heard, and in a language so impressive and intelligible that it must be understood.

ANIMALS IN WINTER.

THERE is no subject more engaging to the student of nature, than that which relates to the hibernation of various animals of our latitude. The raccoon and woodchuck who lay up food for their winter stock, hibernate in dens among the rocks, and in deep burrows below frost. The former,

it is true, sometimes in February, taking advantage of a thaw and a short time of warm weather, sallies forth from his winter quarters for a night or two, although never in pursuit of food: but the latter is awakened from his repose only by the return of warm weather. I am credibly informed, that the late Col. Jeremiah Wadsworth, of Hartford, with a view of experiment, procured a young woodchuck to be petted in the house. Upon the approach of winter, the animal, impelled by instinct, took up his abode for hybernation behind a row of casks in the cellar—not by burrowing in the ground, but by making for himself a small excavation on the surface, in which he planted himself in a circular form, a position the most accommodating to his condition. Many times during the winter, Col. W., to gratify the curiosity of his friends, directed the woodchuck to be brought up. The torpid animal, after lying fifteen or twenty minutes on the carpet before a cheering fire in the sitting room, would begin to yawn, then stretch out one limb after another, open its eyes, slowly raise itself on its feet, and walk rather awkwardly from the immediate influence of the fire, appearing very weary till returned to bed in the cellar, uniformly refusing nourishment of any kind during the time of its hybernation.

American Journal of Science.

From the Genesee Farmer.

RAISING OF EARLY TOMATOES.

To those who are as fond of this delicious vegetable as we are, it cannot be otherwise than acceptable, to know how it may be brought to early perfection. In this climate, sowed in open ground at the usual season of sowing seeds, it ripens not till September, nor even then if the season proves cold. To have the fruit in perfection, at least two months earlier, during the warm part of the season, when it is the most grateful to the taste and most wholesome, is no unimportant desideratum. The past season I had ripe tomatoes at the fourth of July, and an abundant supply for my table the rest of the summer. The mode I practise is this: in the month of January or February, I sow a small quantity of the seed in a box, which I place in the window in my kitchen, taking the same care of the plants when they come up that I would of a green house plant, to guard them against being frozen. They here grow till the month of March or April, when they are transplanted into a hotbed, a part of them to remain to produce the earliest fruit, and a part to be again transplanted in the open ground, when the season becomes sufficiently warm, to produce a succession. In this way I never fail to have abundance of this wholesome and delicious vegetable, ripe and in fine perfection, at that part of the season when it is most desirable. Those who have green houses might in this way have the plants growing all winter in pots which early in the spring taken out of the pots with the ball of earth about their roots unbroken, and planted in a hot bed, would produce ripe fruit by the beginning of June. They would well repay this extra care and trouble.

INSECTS.

THOSE who are desirous of keeping their fruit trees free from insects, should wash them with soap suds before the insects have left those places where they have passed the winter, and before the eggs which were deposited under the loose bark, and beneath limbs, &c. have hatched. By early

washing trees, and vines, with strong soap suds, or with lime water, not only are innumerable eggs and insects destroyed, but the young plants and seeds of many varieties of mosses which infest or injure trees and vines are destroyed also. Trees that are annually washed, have a more healthy appearance than those that are not, when growing side by side.

BOOKS.

LET us consider how great a commodity of doctrine exists in books; how easily, how secretly, how safely, they expose the nakedness of human ignorance without putting it to shame. These are the masters who instruct us without rods and ferules, without hard words and anger, without clothes or money. If you approach them, they are not asleep; if investigating, you interrogate them, they conceal nothing; if you mistake them, they never grumble; if you are ignorant they cannot laugh at you.—*Philobiblion*, by Richard de Bury.

LAYING PLANTS.

MR. MUNRO, in Loudon's Magazine, recommends splitting the layer for some distance, instead of the common method of notching or tonguing them. They are not as likely to break, and send out fibrous roots sooner. A piece of clay or moss is put in the slit to keep it apart.

ITEMS.

Soot to stop Blood.—It has been found that soot applied to a fresh wound will not only stop the bleeding, but ease the pain.

Gold and Silver Fish.—These fish are said, in Loudon's Magazine, to breed abundantly in water that is moderately warmed by additions from factories.

Watering Plants for Market.—Watering plants in markets gives them a fresher appearance, but repeated waterings are pernicious, neutralizing the juices of some, rendering others bitter, and making all vapid and disagreeable.

Silk Handkerchiefs, the product of the native mulberry, have been manufactured at Dayton, Ohio, and for durability and texture are said to be equal to the best that are imported.

HINTS TO PEOPLE WITH EYES.

On first awakening in the morning, do not expose yourself to a sudden glare of light.

Do not rub your eyes with your fingers, or any thing else: it excites inflammation. If the lids adhere, gently pass your finger over them with saliva.

When obliged to guard the eye from the glare of light, let the shade be of simple green silk, so suspended as not to press upon the eye.

Bathe the eyes, morning and evening, in pure cold spring water. Pump water is not good. A fine linen handkerchief should be used to wipe them dry. Never wash them when you are perspiring, or very warm.

Eye cups or glasses are worse than nothing.

Persons engaged on white articles, or minute work, should choose rooms in which there is a long perspective, on which their eyes may rest for occasional relief.

All brilliant linings for hats should be avoided, as the rays reflected from them are more dangerous than the direct rays of the sun.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MARCH 19, 1834.

FARMERS' WORK.

Spring Wheat. The old maxim, "better late than never," does not apply to the sowing of Spring wheat. It is better not to sow Spring wheat at all, but to use the land for some other purpose, than not to sow it in due season.

Seed wheat should first be run through a screen to take out the seeds of cockle and other weeds. It will then be advisable to wash it thoroughly, and prepare it for sowing by a suitable application or process. Young's Annals give in detail a number of experiments in steeping seed wheat in ley, lime-water, and water impregnated with arsenic. The result was that very sinutty parcels steeped in ley twelve hours, and in lime-water twenty-four hours, procured crops entirely free from sinut. The following process has been recommended by an excellent practical farmer.

"The only successful course is to prepare the seed about ten days before sowing time. This is done by selecting clean plump seed, passing it through water in a tub, about half a bushel at a time, washing it, and skimming off all the matter that floats, then empty it into a basket to drain,—then lay it on a clean floor and rake in two quarts of slacked lime, and one quart of plaster to the bushel, and if too dry, sprinkle on water and continue to stir it till all is covered with the lime and plaster. In this way you may proceed till the whole is prepared. Let it remain in a heap one day, then spread it and remove it daily until it becomes perfectly dry; it is then fit for sowing, and you may sow it if the land should be quite wet."

Quantity of seed to an acre. PAYSON WILLIAMS Esq. of Fitchburg, Mass. in his account of raising a crop of the Black Sea Wheat,* observed that he sowed his wheat in April, at the rate of two and a quarter bushels to the acre; "on the same acre from which 613 bushels of potatoes were harvested last autumn."

The wheat plants will be less liable to drought if the seed is ploughed in with a shallow furrow. A light horse plough will answer this purpose. If it is meant to lay down the land to grass, it will be best to harrow and roll the ground smooth after sowing.

It is recommended in Bordley's Husbandry to sow a border of rye round a field of wheat to prevent its being blasted. That writer states that "Mr. Isaac Young of Georgia, mixed rye among his seed wheat, and thus escaped the blast of his wheat. It was repeatedly tried till he was convinced of its efficacy; and then he sowed five acres with wheat surrounded with a list (or border) 25 feet in breadth of rye: this also succeeded, and being repeated is found a certain security for wheat." We do not recollect having seen this mode of preserving wheat from blast recommended by any other writer, but think the subject deserving of further investigation and experiment.

Grass seed. Spring wheat is a very good crop with which to sow clover and other grass seeds, and plough or harrow it in with the wheat. If it be scattered on the surface without being well covered, a part does not vegetate, and that part which does will be liable to injury from drought. Mr. Alexander St. John, of Montgomery, N. Y. in a communication to the New York Board of Agri-

culture, published vol. ii. p. 247, after mentioning several experiments in which he sowed too small quantities of grass seed to procure profitable crops, observes in substance that he finds eight pounds of clover seed and seven of timothy seed is the proper quantity to be sown on an acre for mowing, or twelve pounds of clover seed on each acre for pasture. "From land in a good state of cultivation, thus seeded, I now cut four tons of hay to an acre, which is of good quality. The expense of mowing is not so great as formerly, as the grass grows rich and fine. If it lodges down it generally falls one way, so that the mower can proceed much faster than when it lies in every direction. The extra fall pasture produced by this manner of seeding, pays me the first fall for the extra seed sown, the grass being so rich it preserves a moisture on the surface of the earth, and is not so liable to be injured by the dry weather as it is in the common mode of seeding, and it leaves no room noxious weeds: the pastures are clean and handsome. When I wish to break up land which is thus stocked, (which I do every fourth year,) I find the soil increased in quality, easy of cultivation, and in a good state for wheat or corn."

GARDENER'S WORK.

Lettuce may be sowed every month, from February, or the opening of spring, till July. Sow broad cast on land recently dug, rake in lightly a quarter of an ounce of seed for a seed bed ten feet long and four feet wide. It may also be sowed between vacant rows intended for other plants, and pulled out for use before the other plants are large enough to be encumbered by it.

Peas. Of the small early kinds, one pint will sow a row of twenty yards; for the larger sorts, for main crops, the same measure will sow a row of thirty-three yards. For early sorts, make the drills one inch and a half deep, and from two and a half to three feet asunder. For summer crops and large sorts, drills two inches deep, and four, five, or six feet asunder. Along the rows of the smaller peas, sow three in an inch, and the middling sorts two in an inch. The larger sorts from an inch to an inch and a half apart in the drill. Early peas cannot be sown too soon after the ground is thawed.

Parasnis. Sow as early as the ground is thawed, if not too wet. Loudon says "For a bed five feet by twenty, the plants to remain thinned to eight inches distance, half an ounce of seed is the usual proportion." Deane recommends sowing them "across beds, fifteen inches apart, and to allow fifteen inches from plant to plant at the last thinning, which may be early, as they are not often hurt by insects."

Radish. Sow each sort separately; and for a bed four feet six inches by twelve feet, two ounces of seed will be required for the spring sorts, and an ounce and a half for the autumn varieties. Dr. Cooper observes that "Radishes ought to be sown on rich ground, and carefully tended, so as to grow quickly; if not, they become stringy, in which state they are very unwholesome." A scattering of the smaller growing sorts may be sown among other crops of larger and later growth.

Cucumbers. In a Treatise on Gardening by J. Armstrong, N. Y. we have the following passage: "To obtain early cucumbers we must have recourse to artificial heat, and with the less reluctance, as of all plants, the cucumber is that with which it

best agrees. To this end therefore scoop as many turnips as you propose to have hills,—fill them with good garden mould, sow on each three or four seeds and plunge them into a hot bed. When the runners show themselves, spare them or pinch them, or bury them as you think best; and on the 10th of May transfer them to the beds where they are to stand. The advantage of a scooped turnip as a seed bed, over pots or vases will now appear—for instead of the ordinary difficulty of separating the mass of earth and the plants from the pot which contained them, and without injury to either we re-inter both pot and plants, and even find in the one an additional nutriment to the other. The subsequent treatment does not differ at all from that of plants cultivated in the open air." It will be well to make a hole through the bottom of the excavation in the turnip, otherwise the roots of the young plant may be too much confined. Other plants, such as summer squashes, melons, early corn, &c. might be forwarded in the manner above stated.

Plants may also be brought forward early by sowing their seeds in small pieces of turf or sward ground inverted placed in a hot bed, and the plants transplanted together with the turf, when the season is sufficiently advanced to permit them to flourish in the open air.

TO CORRESPONDENTS.

A POEM on "*The Virginian Silk Worm*," printed in London, in the year 1655, shall appear in our next. Several other favors under consideration.

Old Specimen of Silk Manufacture. A gentleman has left in the Office of the N. E. Farmer some patterns of silk, manufactured 45 years ago, in Branford, Con. by Miss Fowler, who made her wedding dress of silk, including the coloring, with her own hands. It were well if the manufacture of a silken wedding dress were considered a single lady's indispensable to connubial felicity, in these times, when economy is more talked about than practised.

The gentleman, who requests information relative to a bill before the Legislature of Mass. for granting a premium on the culture of the Mulberry, is informed that it is indefinitely postponed.

ITEMS OF INTELLIGENCE.

We saw yesterday, the sheep purchased by Mr. Shneck of Mr. Barney, the tenant of the Girard homestead, on the neck. They are truly splendid samples of the real Bakewell breed, with back broad enough for a rail-road. The sheep will be for sale at the shambles, Nos. 10 and 12, in South-second Street Market. Those who like to look at good things should pay a visit to the place on Thursday, and those who like to eat good fat mutton, should purchase liberally.—U. S. Gazette.

Manufactures. The condition of the manufacturing interest is at this time extremely depressed. Both cotton and woollen goods are lower than they were last fall, by one quarter. Notwithstanding the moderate price of the raw material, cotton goods of the common qualities cannot be manufactured short of a net loss of ten or fifteen per cent. There are other sources of peculiar embarrassment at this time. The manufacturers have many of them neither cash nor credit with which to buy the raw material, though their condition in this respect is not at all singular. In addition to this, they have no means of negotiating to raise money on their manufactured goods, for the commission merchants will

* N. E. Farmer, vol. xii. p. 58.

not accept their drafts, except at so long a time that the banks will not discount them, nor at any time, in fact, to the extent which it is needed. Under these circumstances the manufacturers have many of them shut down their gates and dismissed their hands, and others are constantly taking the same course.—*N. Y. Journal of Commerce.*

Migration from South Carolina. The Camden Journal of the 22d inst., says:—"The rage for migration southwesterly, has, we think, increased during the past year, beyond all calculation. We daily see extensive caravans of movers, many of them carry with them a considerable portion of the needful. In the course of one day last week, we observed nearly two hundred, most of them from North Carolina, and the upper part of this state."

Extract of a letter from St. Augustine (E. F.) Feb. 5.—"There are now over fifty individuals here from the State of New York, for the purpose of obtaining relief from pulmonary complaints—many of them I regret to say, have been exceedingly disappointed in the climate, on account of the rainy seasons, which have continued this winter two-thirds of the time. The accommodations, with few exceptions, are miserable, and the charges high."—*Daily Ad.*

The Albany Journal says, that business throughout the western part of the State of New York is entirely prostrated. That millers are without money, and wheat cannot be sold at any price.

His Excellency Gov. Davis has appointed Thursday, the 3d day of April, as a day for the Annual Fast in this Commonwealth.

The Navy Commissioners advertise to contract for the delivery of 120,000 lbs. of Pine Apple Cheese.—*Merc. J.*

WANTED,

An active, industrious man, of energetic character, capable of taking charge of the digging, hoeing, and other culture of an extensive nursery. His business will be to work with and direct four other laborers; which four others are also wanted, and may be selected by him. All must be *New England men*; and as they are wanted as speedily as possible, applications made immediately by mail will be promptly replied to. It is useless for any person to apply who is not precisely of the character above named. **WM. PRINCE & SONS.**
Linnean Garden, Flushing, March 10, 1834.

N. B. 500 lbs. superior Italian Rye Grass—50 bushels Paeye's superior Perennial Rye Grass—and 200 lbs. Trifolium incarnatum, for sale as above. 21 m19

WILLIAM MANN,

Having removed from Augusta to Bangor, will be happy to furnish his former customers (*and all others who may want*) with Forest Trees of almost every variety indigenous to the Penobscot country, and being very advantageously situated, he flatters himself that he can give perfect satisfaction, as no pains will be spared on his part to have the best trees selected and properly packed.

Orders may be left with Mr. Geo. C. Barrett, where catalogues and prices may be seen; or, if more convenient, they may be sent direct per mail. m 19

THE ALBANY NURSERY,

Is now supplied with a large assortment of Pear trees, in addition to its general assortment of Trees and Shrubs, which embraces most of the kinds on demand. Price 37 1-2 cents. Its collection of *Dahlia*s contains more than 300 fine double varieties, and is surpassed by none in the Union. Orders will be received by GEO. C. BARRETT, at the N. E. Farmer Office. **BUEL & WILSON.**
Albany, March 7, 1834. 4t.

EARLY POTATOES.

A few bushels Early Potatoes for Seed; the same kind which received the premium of the Mass. Hort. Society, for 4 years past. For sale at the New-England Seed Store, by **GEO. C. BARRETT.**

10,000 WHITE MULBERRY TREES.

For sale by ABEL NICHOLS, DANVERS. 10,000 White Mulberry Trees of vigorous growth, two years old, and received the first premium of the Essex Agricultural Society. Orders left at this office will be attended to. m 19 p tf.

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,
1 Case wet (but not damaged) Bishops Lawn.
1 do. do. do. Book Muslin.
Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation.
March 14, 1834.

SITUATION WANTED.

A young man with a family, who is well acquainted with taking charge of a Farm, wishes a situation as foreman. Good recommendations will be given. Inquire at this office.

SITUATION WANTED.

A middle-aged man wants employment as a Gardener or Farmer; or will attend to them both if required, which branches he has been acquainted with for many years in England and America. He possesses the most unqualified recommendations. For particulars apply to the Rev. Mr. Neal, South Boston; No. 223 Hanover Street, Boston, opposite the Globe Hotel; or No. 165 Ann Street. m 19

APPLE TREES FOR SALE.

3600 budded Apple Trees, consisting of Baldwins, Russets, Siberian Crab, Porter, River, Rhode Island Greenings, and Blue Pearmain. The above are very thrifty Trees, and in fine order for transplanting, being four years from the bud. Inquire of JONAS WYETH, Fresh Pond Hotel, Cambridge. March 13, 1834. 8t

PAINT OIL.

The subscribers keep on hand a constant supply of their "Prepared Paint Oil," which is offered for sale with renewed assurances of its merit. This Oil, independent of being 25 per cent. cheaper in price, will actually cover a quarter more surface, as has been repeatedly proved and confirmed by statements of many Painters. Upwards of 200 buildings in this city and vicinity can be referred to, many of them painted two years ago, which continue to look well, and retained their gloss through the first year, which is a clear demonstration of its strength. The Prepared Paint Oil is found to answer a valuable purpose to mix with Linseed Oil, giving it strength and durability with a more permanent gloss. It paints a very clear white, flows smooth, and is still more free from mildew, changes resulting from the sea air, than any other Oil.
Oil Factory (head Foster's Wharf.)

DOWNER & AUSTIN.

P. S. Please be particular to order Downer & Austin's "Prepared Paint Oil." m 19 6pis.

ASPARAGUS ROOTS.

Fine large Asparagus Roots, the same that obtained the premium last season, in boxes of one, two, and three hundred, for sale at the New England Seed Store, North Market Street.

LARGE POTATO OATS.

30 BUSHELS of this valuable variety of oats, of which an account will be found in No. 6, Vol. 12, New England Farmer, the rate of 93 bushels to the acre was raised in this vicinity last season.

For sale by GEO. C. BARRETT.

New England Seed Store.

FARM FOR SALE.

Situated in the South Parish in Andover, little more than half a mile southwesterly from Phillips' Academy and the Theological Institution, and about one mile from the Rev. Mr. Badger's Meeting-house,—containing about forty acres of valuable land, being the choice part of a much larger farm—having thereon one large and convenient two story dwelling-house, finished and in good repair, lately occupied as a boarding-house.—Also, near it, a one story dwelling-house in good repair. Also a barn ninety feet long, sheds, wash-house, wells of excellent water, gardens, fruit trees, &c.—A very eligible situation for any person desirous of retiring into a pleasant country town for the purpose of educating his children. The above valuable estate will be sold at public auction on Tuesday the first day of April next, at 3 o'clock P. M. Conditions of sale liberal. **SAMUEL FARRAR.**
Andover, Feb. 24, 1834.

FARM FOR SALE.

On the road leading from Newton West Parish Meeting House to Waltham Factory, containing from 50 to 75 acres of land, well proportioned into mowing and tillage.—Also House, barn, and out-houses with the same. Said farm is well watered, and has a valuable fruit Orchard.

TEA SPRING WHEAT.

25 BUSHELS of this valuable variety of SPRING WHEAT, of which a trial of three years has proved it to be a productive kind, not liable to blast or mildew.

There was raised last year 25 bushels to the acre, and being a sure crop, making the best of flour, it is recommended as a superior variety. For sale at the New-England Seed Store by GEO. C. BARRETT, and also to be obtained of JOHN PERRY, Sherburne, Mass. m 12.

BRIGHTON MARKET.—MONDAY, MARCH 17th, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 275 beef cattle, 14 pr working oxen, 15 cows and calves; 162 sheep, and 1200 swine,—400 swine passed through Brighton on Saturday.

PRICES. *Beef Cattle*.—Sales were quick and last week's prices were fully supported. We noticed four yoke taken at \$6, one of which was purchased by Mr. Adams of Kingston for the Plymouth Market. We quote prime at 5 50 a 5 75; good at 5 a 5 50; thin at 4 75 a 5.

Working Oxen. No sales noticed.

Cows and Calves.—We noticed sales at \$18, 24, 28, 30 and 35.

Sheep.—We noticed one lot taken at \$8 each, one at 7 each, one at 5, and one at 4 50 each.

Swine.—In demand and sales quick. Several large lots were taken at 5 for sows and 6c for barrows, and several lots for 5 1/2 for sows and 6 1/2 for barrows, one lot of selected barrows at 6 3/4 and retail, 6c for sows and 7c for barrows. Several thousand more are wanting.

MISCELLANY.

From the Vermont Intelligencer.

METEORIC COTILLION.

Not many years since, as you all recollect
When the people were dancing around Lafayette,
The planets, desirous of outshining all,
Determined on giving a "Celestial Ball"—
Then Jupiter, Saturn, and General Mars,
With Venus and Juno, danced round the fixed stars.

But wonders more strange were performed t'other night,
Which caused the old folks to take such a fright,
The comet and meteor could not be outdone
By any large planet that rolls round the sun;
They therefore determined, about forty million,
To have by themselves a tremendous cotillion;
On the first pleasant night, the Milky Way clear,
Each sparkling young belle was engaged to appear.

The sun in good season had gone off to bed,
And each sleepy mortal was nodding his head;
The birds and the beasts were all silent and still,
And chilled were the lips of the babbling rill;
Not a croak from the frog in his long winter bed,
Not a rat or a mouse dared to pop out his head;
The foxes no more dared to trot o'er the plain,
Or nibble the turkeys or geese they had slain;
The sapient owl—so affrighted was he,
That he hooted and skulked to his own hollow tree.
All nature was silent, the stars sat at ease,
Till the music came floating along on the breeze.
Æolus of old, a right musical fellow,
Now took down his harp from a neighboring willow,
Then tuning his strings, fill'd the whole hemisphere
With music to charm and to ravish the ear,
Not long had he played, when the meteors far,
Impatiently waiting beyond the north star,
Heard the music, and seizing the hand of each fair,
Came frisking and dancing along in the air.
Each one took a lamp from the bright northern light,
To show off his spangles and dress in the night.
Of the dress of the ladies, suffice it to say,
They were all laced so tight that they fainted away.

Now hornpipes and waltzes prevail through the sky,
And all upon *pigeon wings* caper and fly,
Right and left, rigadon, cross over and chain,
Then balance your partner, and swing round again,
Now down the outside, and then up in the middle,
Cast off and Chassee, with a heigh diddle-diddle.
Such dancing and waltzing you ne'er laid your eyes on,
From the top of the zenith down to the horizon;
Round the most distant planet each fair little maid
By the side of her beau took a sweet promenade.
The drink was pure ether—of wine there was none,
For each then belonged to the *Temperate zone*.
The party continued to dance and to feast
Till blushing Aurora came up in the east,
Who blew out their candles and spoil'd all their fun,
And made all the company "scamper and run."

LICKITACUT.

HUMAN AND ANIMAL SENSATION.

WHEN the epicurean ransacks the three kingdoms of nature in all their provinces, and even presses in putrefaction itself, to give a flavor to his mess, he has actually less animal pleasure in that mess than the rustic has in a crust of wholesome brown bread, or a potato nicely roasted in the turf ashes. His sensation may be different, but it is not better; and let a man be but hungry enough, and give him something to appease that hunger, and all the cooks that "the devil ever sent" to mar Heaven's bounty can give no more enjoyment. So also in drinks—wines have their gusto, and other potations their exhilaration; but "Adam's wine," as in wells living from the rock, free from foreign

substances, and showing every gem of the casket in each drop, is, in truth, and will remain "the liquor of life." The weary, the fainting, and the dying, call not for burgundy, or champagne, or to-kay; the longing of their heart, the hope of their recovery, or the alleviation of their anguish, is "water,"—water clear from the fountain, or fresh from the cistern. Thus we see that, even in those cases in which art and luxury have done the most, human nature, when it comes to the hour of tribulation—to the moment of peril—to the article of strife with nothingness—clings to the freshness and simplicity of nature. And it is even so in every thing. When cold sweat bedews the temples of the monarch—when artery and vein have forsaken each other, and the curdling fluid is breeding corruption in the little capillary tubes between—when the heart's feeble pulse is flung back upon it by the dying vessels, and it is about to be broken by its very strength—when the lungs will no longer remove the charcoal, but make, as it were, the fire of life to smoulder in its own ashes—when the currentless throat begins to be choaked up by its own refuse—when the angel of death stands ready to loosen the "silver cord," and break the "wheel at the cistern, and the pitcher at the fountain,"—what then reck the monarch for his state and his diadems! Cast aside that sceptre, it is a bauble; doff that crown, it is nothing; rend away the velvet and the tinsel, they are trash; remove that coverlet of satin, it is a burden: give him the fresh air of heaven—the first draught of nature that he drew—so that the king may die easily and in peace; free the monarch of all the trappings of his grandeur—so that the spirit of the man may mount in triumph to its God.—*Mudie.*

WATERSPOUT ON THE LAKE OF GENEVA.

M. MAYER, who resides at Mollard Place, Geneva, in looking through his window, which faces the lake, saw to his astonishment, on the third of December last, about a quarter before eight in the morning, in the direction of *Paquis* and *Secheron*, a vertical column of water, at least sixty or eighty feet high, and several feet in diameter, larger at its base than its summit, of a grey color, and appearing animated with a gyration motion. The column rested on the lake below, and was bent towards the top in the form of a bow. It remained nearly two minutes without any sensible change of place; and then sunk, by degrees, from above, by diffusing itself in a shower of rain. At this juncture a southwest wind ruffled the surface of the lake; the sky was entirely covered with thick vapors, which occupied the upper regions, while there were, properly speaking, no clouds in the horizon.

This is not the first spout seen on Lake Lemman. One which occurred in 1741 was described in the French Academy. It lasted several minutes. Another was seen in 1764, in the month of August, which continued nearly an hour.

In the spout witnessed by M. Mayer, the top of the column had no communication with thick clouds, as is sometimes the case, no trace of any such cloud was to be seen, neither above the column nor in its neighborhood,—hence there were no indications of electrical attraction to which the effect could be attributed, and there seems no means of accounting for the prodigious force then exerted to sustain a column of water of such height, except that which ascribes it to a current or whirlwind of excessive intensity.—*Bib. Univ.*

REDUCTION IN PRICES OF TREES, &c.

WM. PRINCE & SONS have determined in consequence of the pecuniary pressure, to reduce the prices of a great variety of Trees and Plants, where orders are sent for a considerable amount: and all persons who desire Fruit and Ornamental Trees; Flowering Shrubs and Plants; Green house Trees and Plants; Splendid Dahlias; or Seeds—will on applying to them direct by mail, with a list of the articles wanted, be promptly furnished with a printed sheet explaining the reduced rates.—The Chinese Mulberry, or *Morus multicaulis* are now reduced to \$25 per 100, and \$4½ per dozen.—Apple trees in great variety \$20 to \$25 per 100.—Pears \$37½ per 100, and extra large ditto 50 cents each; and 50,000 are two, three, and four years grafted.—Peaches \$20 and 25 per 100.—Large Orange Quinces \$30 per 100.—English and Spanish Filberts \$25 per 100.—Fine Red Raspberries \$6 per 100.—Large Red and Yellow Antwerp \$16 per 100.—Gooseberries, finest Lancashire varieties \$20 per 100; and Large Red White and Black English Currants \$16 per 100.—Isabella Grape, 3 years old vines \$25 per 100, and 2 years ditto \$20 per 100.—Catawba, Alexander, Wime, York Claret, York Madeira, and Scuppernong, \$25 per 100.—Herbmont's Madeira, Troy and Elsingburgh, \$30 per 100.—Norton's Virginia Seedling \$35 per 100.—The collection of choice European Grapes is unrivalled.—Chinese Ailanthus, 4 feet high, \$4½ per dozen and larger sizes in proportion.—A reduction is made on a great many kinds of Roses, Pæonies, Chrysanthemums, &c.—Double Dahlias of such fine assorted kinds as have been most increased, will be supplied at \$3, \$4 and \$6 per dozen, according to excellence, and selected by ourselves. The roots can be sent to any distance.—The new varieties of Flemish and English Pears having been introduced by us and greatly increased, the prices of the greater part have been reduced, and the trees are mostly of fine size and three years ingrafted.—The Ornamental Trees and Shrubs of most kinds are large and thrifty, and of double or treble the value of smaller ones, which is a most decided advantage, being a gain of several years in embellishment.

N. B. Having no Agent at Boston, the Commission of 10 per cent. usually allowed for Agency, will be credited to the purchasers, and be deducted from the amount of the bills rendered. The stock of Dahlias being so very large, they will be furnished on the most favorable terms possible. Linnæan Botanic Garden and Nurseries, }
Flushing, near New-York, Feb. 10, 1834. }

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated *Pear* alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 260 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus multicaulis* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnut, Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

GOOSEBERRIES.

A new importation of superior kinds, just received, of all colors, by WM. KENRICK, Newton.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

Printed for GEO. C. BARRETT by FORD & DAMRELL who execute every description of Book and Fancy Printing in good style, and with promptness. Orders for printing may be left with GEO. C. BARRETT, at the Agricultural Warehouse, No. 52, North Market Street.

NO. 37.

ADDRESS

DELIVERED AT THE FORMATION OF THE

BERKSHIRE HORTICULTURAL SOCIETY,

*Lenox, Oct. 31, 1833.....*By SAMUEL W. BUSH.

(Concluded from p. 282.)

HORTICULTURE is the science of gardening—of rearing fruits, vegetables and flowers. It is a refinement, if we may so term it, of husbandry—it is the poetry of agriculture. Hence we find, that it is successfully cultivated only in those countries distinguished for civilization. Lord Bacon observes, “that when ages grow to civility and elegance, men come to build stately sooner than to garden finely, as if gardening were the greater perfection.”

In looking over the history of past ages, we shall find that but little attention was devoted to Horticulture. The learned and refined only, and these were not numerous, of the ancient world, cultivated gardens. Practically, they were unknown to the mass of the people—they deeming it sufficient to believe that their future Elysium or Heaven would consist of islands garlanded with flowers, and fragrant with the perfume of spices and fruits,—like the garden of the Hesperides the favorite haunt of the gods. The ancients knew nothing of Chemistry, Botany or Geology, and it is principally by the aid of these sciences that modern Horticulture has arrived at its present advanced state. By Chemistry we can learn what is the composition of plants, and the food most proper for them. Botany unfolds to us the anatomy and nature of plants, particularly the numerous and admirably contrived vessels for the absorption of food, &c. Geology enables us to ascertain what kinds of soils are most favorable to the growth of particular plants, &c. We may safely assume, therefore, that in proportion as a people advance in knowledge, civilization and refinement, will be the progress and universality of Horticulture.

This position can be fortified by abundant facts, but we must content ourselves with a statement of a few general statistics, which show how slow has been the progress of Horticulture, with that of the sciences just named.

From the earliest period of time to that of Pliny, the Elder, who flourished in the first Christian century, there were but about *one thousand* species of plants discovered and described. This embraced a period of about *four thousand years*. Subsequent to Pliny, tolerably rapid additions were made to the catalogue of newly discovered species of plants, until the time of Linnæus, (a period of about *sixteen hundred years*) when there were about *four thousand five hundred* species of plants known. From Linnæus, who first gave a permanent scientific form to the knowledge of plants, to the present time, (a period not more than *half a century*) so surprising have been the advances made in Botany, that the number of species *now* known, is not much less, as we have already indicated, than *one hundred thousand*! The knowledge of the sciences of Chemistry and Geology has advanced in the same ratio. Wonderful indeed hath been the progress of Science, and benign hath been its influence.

British writers on Horticulture mention that

most of their best fruits, particularly apples and pears, were brought into the island by ecclesiastics, in the days of monastic splendor and luxury, during the 12th, 13th, 14th and 15th centuries. Most of their common pot-herbs, such as cabbages, were imported from the Netherlands. Rapid improvements were made in Horticulture during the reign of Henry VIII.; and the monarchs succeeding him patronized every attempt to prosecute this science. It was not, however, until 1805 that the London Horticultural Society was formed, under the auspices of the most distinguished scientific and practical men of the kingdom. It was the first institution of the kind established in Europe. By its unwearied researches, it has collected from every part of the globe—from Asia, Africa, America and continental Europe—a very large number of rare and valuable plants, which now enrich and beautify the rural retreats of our father-land. Scarcely a cottage is to be found that is not surrounded by fruit trees, shrubs and flowers. On one-fourth of an acre of ground esculents are so well cultivated as to supply much of the food for its inmates. England exceeds every nation in its attainments in Horticulture, and the benefits resulting from it, physical and moral, are allowed to be incalculable.

In 1809 the Caledonian Horticultural Society was formed in Scotland. Its founders were of the first rank and character of that enlightened nation. The Hort. Society of Paris was instituted in 1826, and is represented as rapidly increasing in numbers and influence. Three courses of lectures on rural botany are delivered every year, gratis, to cottagers, and others, who move in the humbler walks of life. In Holland and Germany all ranks in society bestow especial attention to the grounds about their habitations. In the last named country the culture of a garden and fruit trees forms a part of the instruction in the ordinary seminaries of education. No schoolmaster is considered qualified for his station unless he can teach his pupils how to manage a garden and orchard. The windows and balconies in Seville and Cadiz and other cities of Spain, are filled with pots containing a great variety of flowers. Cottages are every where beautified with them.

The countries we have named, except perhaps the latter, which now exists in “faded splendor wan,” have been and are now distinguished for refinement and scientific attainments.

On referring to the history of our own country it will be found that very little attention has been directed to Horticultural pursuits, except within a very few years past. And for an obvious reason. A young nation has so many difficulties to contend with, and so many wants to supply, that its citizens can give but little time to the cultivation of the ornamental and scientific departments of gardening. Our fathers were engaged in defending rather than in cultivating the soil, and in elaborating our Constitution of government, confessedly, of the kind, the noblest fruit of human genius. But, like a rose borne on the bosom of the troubled sea, flourished, in the stormy time that “tried men’s souls,” the Bartram Botanic Garden of Pennsylvania. This was founded in 1720 by John Bartram, a great vegetable naturalist, and was the first insti-

tution of the kind established in the then Colonies. It has experienced many vicissitudes, but it is yet in existence, and is considered one of the best and most extensive nurseries in the United States. It exports thousands of plants and seeds every season to Europe and South America. It contains 2000 species of our native productions; and its exotic department consists of 1900 varieties. The nurseries of Prince of Flushing, N. Y.—of Thorburn, and others, in New York city—of Judge Buel of Albany, are of more recent date, but from them can be obtained almost every species of plants.

The first Horticultural Society instituted in the U. S. was in the city of New York in 1818, by a small number of enterprising and intelligent practical gardeners and nurserymen. By awarding premiums for the best specimens of fruits, &c. its exertions have been signally successful. Soon after, a society was formed in Pennsylvania. In 1831, the Charleston, S. C. Hort. Society was formed. In 1832, a society was formed by a number of spirited and scientific citizens of Baltimore, under the title of the Maryland Horticultural Society. In Albany, Genesee, Newburg, Buffalo, and other places, similar institutions have been recently established.

The descendants of the Pilgrim Fathers have not looked calmly on and remained inactive. With but two exceptions there is now a Horticultural Society in every state in New England—but in almost every county of every state there exists an “Agricultural Society.” To our own Berkshire belongs the honor, and it is a high honor, of first establishing this Institution in the United States: And with honest pride she may well exclaim, on surveying the number of societies, which have been called into existence within the limits of our Union, “These, these are my jewels!”

In 1829, the first Horticultural Society in Massachusetts was formed at Boston. An act of incorporation was granted by the legislature, under the title of the “Massachusetts Horticultural Society,” and so efficient has been its operations, and so excellent its influence, during the time it has been established, that it has been said of it by a distinguished horticulturist of another State, that “it is the most useful institution of the kind in the country.” Its annual exhibition is held in September, the season of fruits, when premiums are awarded by committees appointed for that purpose, for the best specimens of fruits, vegetables, shrubs and flowers. With foreign horticulturists and societies, it has extensive correspondence, by which means valuable exotics are obtained and new modes of culture introduced. Time will not permit us to enter into the detail of its operations. We cannot give a better idea of the benefits which result from the establishment of a Horticultural Society, and of this Society in particular, than by quoting the testimony of Dr. Malthus A. Ward, as contained in his learned and excellent Address of 1831. “Its influence (says he) ‘has become strongly marked, not only around the residence of its members, but throughout this section of the country. Never before was there so much inquiry for ornamental trees and for the choicer kinds of fruits among the people of all classes. Never before did gardening and rural affairs engross so

large a share of common conversation—often entirely excluding those unprofitable and acrimonious discussions on politics, and those religious controversies which are so apt to terminate in uncharitableness and ill-will. Never before was there an opportunity for the interchange of such cheap but acceptable civilities, as the offer of desirable plants, seeds and scions of favorite fruits, or the timely donation of a delicious melon or a basket of grapes. By these means, harmony of neighborhoods has been preserved, valuable acquaintances acquired, unpleasant feuds have been suppressed, and many petty jealousies, which secretly rankled in the bosom, have been allayed, and may soon be forgotten. Not only the grounds of the men of wealth, but the home of the laboring poor has in not a few instances acquired an additional point of interest, to attract him from the haunts of dissipation; his leisure hours are pleasantly occupied; his mind expanded, and his heart warmed and softened."

Similar testimony is given of the influence of Horticultural Societies elsewhere. How indeed can this influence be otherwise? To be delighted with the productions of Nature, the desire to cultivate the earth, are sentiments natural to the human heart. Nourished and protected by her bounty, it were monstrous indeed did he not love his parent and benefactress. The first man, and the first men, in all ages, cultivated the earth. The anxious merchant, the pale artisan, the worn and harassed professional man, during the hours of relaxation from their grinding labor, dwell fondly upon the thought of possessing at some future day a spot of earth where they "can play with flowers and babble o' green fields." Peace, Health and Contentment are the spirits that gladden the habitations of the devotees of Agriculture and Horticulture. Happiness is associated with our ideas of the enjoyment of a garden. The care of one to all men, and especially to the female sex, whose sensibilities are "tremblingly alive" to impressions of the beauties of nature, is a source of inexhaustible pleasure and of innocent domestic recreation. In this fondness of a garden, as constituting a part of the female character, who does not acknowledge a peculiar propriety? It has been so in all ages and nations, from the period, when

"Proserpine gather'd flowers, herself the fairest."

How dreary would be the world without a flower! It would be as the heavens without a star. From rosy boyhood to withered age, flowers are the cherished objects which afford the purest and most innocent pleasure. Their airy form and viewless fragrance make us think of invisible beings, and "the thoughts of the invisible are the thoughts of the good." The Scriptures abound in allusions to flowers. The Saviour expressed his deep sense of their beauty: "Behold the lilies of the field! they toil not, neither do they spin, yet Solomon in all his glory was not arrayed like one of these." The admired attention of the most heedless observer, of the obtuse and cold-hearted, is irresistibly attracted to them. And what favorable impressions do we receive of the taste and disposition of the inmates of the humblest cottage, on witnessing the woodbine trailed over the porch or lattice, and the flowers glowing in variegated beauty in their garden. The electric chain of our sympathies is instantly touched.

"One touch of Nature makes the whole world kin."

Horticulture, then, is entitled to our special at-

tention. Its pursuits are eminently peaceful and salutary to the physical and moral nature of man. They invigorate the body, expand the mind, refine the taste, and open a wide field for rational enjoyment. No pursuit affords better opportunities for observing many of the most striking and important operations of the material world. In connexion with the business of horticulture, the study of nature is carried on with peculiar advantage. By his constant attention to the plants under his care, the horticulturist becomes acquainted with their habits and modes of life, and his knowledge of them is greatly facilitated by the aid of Chemistry, Botany and Geology. Intelligence, industry and skill are of course indispensable agents in the business of horticulture. No state of existence is less enviable than that of the owner of a farm or garden who has not knowledge or science enough to be interested in his occupation, or in the scenes around him.

We might further enlarge on the importance and excellence of the pursuit of Horticulture—important, as bringing into use as articles of food foreign plants, or improving the quality of those we possess—excellent, as refining the taste, softening the heart, and elevating and expanding the mind. But it is unnecessary. Every person in this audience, who has a mind and a heart will respond to what we have said.

The establishment of a Horticultural Society in this county has long been a desideratum. You all have witnessed the beneficial influence of the Agricultural Society, in stimulating our farmers to be perfect in the arts of husbandry—in elevating and ennobling their calling—in inspiring them with just and honorable sentiments—and in contributing to develop the social and best feelings of their nature. But a Horticultural Society, besides being a valuable auxiliary, would if possible produce better results. It would attract to its pursuits many, who, from mistaken notions of respectability, and the means of procuring happiness, are averse to agricultural employments—it would develop and diffuse a knowledge of the sciences—it would be the means of collecting seeds, buds, scions and plants of the best varieties, and as a certain consequence every house, however humble, would be enbowed in the shade of many of the most excellent kinds of fruit trees—it would render our beautiful villages still more beautiful—its beneficent energies would be spent in causing two plants to grow where but one flourished before—it would create a species of property which does not now exist—and it would impart additional attractions to the picturesque topographical features of the hills and valleys of our own Berkshire. Ceres would have no rival in Flora, but a benign and beautiful companion.

Inspired by views and considerations like these, this meeting has been convened. Shall not the designs of the gentlemen who called it be seconded? But we will not insult you by a formal appeal to your understandings and feelings. You have taste, you have hearts, you have patriotism. Need we add more? No. Let us combine, then, in the spirit of union and harmony, becoming the lovers of nature and the lovers of man. Let our aim be to do good, by unfolding and circulating the treasures of science and the treasures of earth. Let us re-peruse, and induce those who have not, to read the open volume of nature, for the harmonies of this beautiful universe; for traces of the finger of God; for proofs that divine love and wisdom ra-

diate from every object, however minute or great, from the minutest atom to the most majestic of the orbs that roll in the infinitude of space.

MASS. HORTICULTURAL SOCIETY.

FRUITS EXHIBITED.

Saturday, March 22d, 1834.

Apples. From R. Manning, Winesap, a fine fruit,—and Borassa; also apples, name unknown, brittle and fine.

From Mr. S. Balch of Roxbury, a Newton pippin, in good preservation, and of fine taste and flavor.

Pears. From R. Manning, Catillac or 40 ounce pear, and Easter Beurre.

Easter Beurre from E. Phinney, good and well worthy of cultivation. W. S. POND.

ON THE CULTURE OF THE GARDEN BEAN.

I HAVE been very successful for half a dozen years in obtaining two crops of beans from the same plants. In the summer of 1826, my first crop of mazagan and early long pod beans was by a very strong and violent wind blown down; this was done when the beans were in full blossom. The crop from the blossoms which the plants then possessed was very fine and abundant, and gathered during July. In three weeks after the beans were prostrated, each stem pushed forth from near the root one or more, in some instances four to six fresh stems; these bloomed freely and produced an abundant crop which was gathered during September. Since that grew, I have uniformly bent down, so as to break the stalk near the root, my first and second crops of beans; I have by this means obtained four crops of beans from two sowings, and which supplied me from July 1st to 31st of October. By this method only half the seed was required which I had been accustomed to use and the greatest advantage to me was that only half the ground was required, so that my advantages by this method are four-fold. I always pinch out the tops when the plants are in full bloom; this throws the vigor into the production of fruit instead of a continued increase of stem and foliage. —Cobbett.

TO DESTROY MOLES IN GARDENS.

COLLECT earth worms, kill them, and mix them with the powder of nux vomica. After the mixture has remained in a heap for 24 hours, take the worms and place one or two here and there in the route and hole of the moles. The desired effect is said to be the result.—*Bulletin Universel.*

RECIPE FOR AN OLIVE GREEN.

LET the article be first washed in soap and water, then wetted out in warm water; then boil two ounces of chipped logwood and three ounces of chipped fustic together for half an hour; dip out your dye liquor, and put it into a pan with hot water; put in your goods; dissolve two drachms of verdigris in a teacupful of warm water, which put into a pan of cold water; take your gown from the dye, and run it through the verdigris water, well handling it for ten minutes; take it out and wash it in clean water, and through the dye liquor and again in the verdigris water, and so continue this process till you obtain the color required, only taking care to wash it out of the verdigris water before you put in the dye liquor: dry it in the shade.

INDIAN MEAL BREAD.

TAKE as much corn meal as is wanting for use, sift it through a hair sifter, put it in an iron pot, and pour on it boiling water; stir it with a spatula or ladle till it becomes well mixed and quite thin; this being night, let it remain in the same vessel till morning, and if kept warm it will be well fermented, (which is necessary.) Then put it in what is called a Dutch oven, it being hot before the dough is put in it; apply good live coals upon the lid of the oven and under it, being careful not to burn the bread. When thus prepared, if done carefully and according to this recipe more wholesome and better bread cannot be used for breakfast. I think it an antidiyspeptic, as no lard or butter is used in preparing the bread though after it is cooked, good fresh butter adds to its flavor.—*American Farmer.*

PRESERVING BACON.

AMONG the best flavored dishes that grace the bounteous tables of this country, bacon or ham ranks, if not the first certainly inferior to none.

To make good bacon the meat should be hung with the thickest part upwards, to prevent the exudation of its juices, and each piece clear of the wall, or other pieces, and there left until it is quite dry. Some pound chips, with a few billets of hickory wood or corn cobs, make the best smoke, and also keep the house warm, which is important; for if the smoke-house is cold, all former care will be in some measure lost; a damp will settle on the bacon and it will have a bitter flavor. Bacon should never be smoked in damp weather, as is too often practised, as by it the meat gains nothing in color, but acquires a bad taste; one or two good fires each day will smoke the pieces, in precisely the same time required for salting, that is to say, hams four weeks, shoulders three weeks, and midlings and other pieces two weeks.

I have used red pepper, with I think decided advantage, by throwing a few pods into each fire while smoking; this article, in salting or smoking or in both, improves the flavor of the meat, and tends to secure it against insects. If the meat house is dark and cool, the meat may be left hanging until wanted for use; but if otherwise it should be taken down at the commencement of warm weather, and packed away in salt, clean hickory ashes, or oats; either will secure it from insects or dripping, if the meat be entirely covered over, and the interstices between the pieces properly filled. The use of dry salt will not increase the saline flavor of the meat. I have known bacon very finely preserved, by preparing a strong ley of wood ashes, concentrated by boiling, into which when cold the pieces were dipped.

The alkali and the oil of the meat form a coating of soap in all the crevices, as well as on the surface, which is an admirable protection against the insect tribe.

Some attention should be paid to the construction of the smoke-house. As before observed, it should be rendered warm during the process of smoking, and if it is to retain the meat through the season, should be cool, dry and dark. A brick stove in the centre of the floor with openings for the escape and ascent of the smoke in the sides, is among the best contrivances usual amongst us; but this becomes heated, and does not entirely obviate the danger arising from the occasional falling of the meat, by which houses are not unfrequently burned. It will probably be more safe and con-

venient to build a chimney with a very low fire place, as for a sitting room, and when the chimney is carried up four feet and closed at the top. A small grate placed a few inches from the hearth, will assist the burning of the wood. By having a chimney thus constructed the blaze of the fire can never injure the house or meat; no pieces can fall into the fire when a nail or string gives way, and whilst the blaze and smoke ascends the blind chimney, the smoke must descend again and pour into the smoke house. This plan is highly recommended for its safety and convenience, by a gentleman whose advice is entitled to great respect, and to whom I was originally indebted for several of the directions here given, the value of which I have verified in the course of my own experience.

An Admirer of good Bacon.

From Goodsell's Farmer.

THE SWEET POTATO.

MR. GOODSSELL, I have noticed in several numbers of your papers some observations on the cultivation of the sweet potato, none of which meet my ideas of the correct mode. Having lived a number of years in the State of Georgia, and being conversant with the cultivation of that vegetable experimentally, I am induced to give you some observations adapted to this climate, which if followed, I am persuaded, will be attended with full success.

About the 20th of March make a hot bed in the usual form about four feet square, in which plant your sweet potatoes about three inches apart; let them be treated as hot bed plants during the month of April, keeping on the sash, and no matter how irregularly compressed within the frame, provided they are kept warm and in a growing state.

About the first of May, take a piece of ground well ploughed and prepared, make hills about three feet apart in the row, and the rows about three and a half or four feet apart, then take off your sash from the hot bed, and cut the vines about twelve inches from the root, leaving the root in the bed; remove the vine to your prepared ground, and cut them into lengths about fifteen inches long; take one piece of the vine, wind the middle about the fingers so as to leave both ends out, plant the middle about three inches deep, leaving the ends about two inches above the ground to each hill about five pieces of vine in open order: in about ten days they will have taken root, and about the first of November will have filled the hills with large potatoes.

Then take the seed potatoes out of the hot bed and plant one or two in the middle of each hill, not in the same hills where the vines are placed, but in separate hills. About the middle of June the vines will have run a considerable distance, when they may be cut again and planted in a similar manner in hills freshly prepared for seed the next year. By this method the southern planters often raise from four to five hundred bushels to the acre from the first planting, of large and fine potatoes for use, and from the last planting, which is usually done by them about the first of August, they get a plenty of small ones for seed which they call slips. It is very rare they plant more than a quarter of an acre with seeds, depending chiefly on planting the vine, which if done by the 10th of June, is pretty certain to yield a large crop and will furnish vines sufficient to plant at least 5 acres.

To keep them over winter, or for any length of time for use, they should be packed in such manner as not to touch each other, being very liable to heat like corn, and kept secure from frost. As good a way as any is to set them about half an inch apart covered with dry sand, in a warm dry cellar.

By observing the above directions, I have no doubt they may be raised with great success in this climate. A sandy soil or loam is best adapted to their cultivation, but any dry muck soil will answer very well. I remain, &c.

R. M. WILLIAMS.

PRODUCTIVE SMALL FARM.

THE Ohio Repository furnishes the following product of 15 acres of improved land.

Mr. Thomas Gibbons of Harrison co. Ohio, has a farm of twenty acres of land, 15 of which are improved. He keeps three cows; sells 12lbs. of butter per week, and from 50 to 60lbs. of cheese per annum. He killed 2200lbs. of pork; sold 1723lbs. and keeps 7 hogs over winter. He raised 100 bushels of wheat, and 2 1-2 acres of corn; mowed 3 tons of clover hay and one of timothy, and has from 7 to 9 bushels of clover seed for sale. He keeps two horses and 10 head of sheep; has 3 children; and his hired labor costs him but \$5.

MAPLE SUGAR.

A Method of Extracting the Juice of the Sugar Maple, for the Making of Sugar, without Injuring the Tree.—It has been customary to cut a gash in the tree, from which the saccharine liquor flows, or to bore a hole, and put in a reed, and, when the liquor ceases to flow, plugging up the hole. Both these methods are injurious, and tend to destroy the tree. In the latter case, the tree roots round the plug to some distance within. The following method is proposed in lieu of these, and has been successfully practised in Kentucky. At the proper season for the running of the liquor, open the ground, and select a tender root, about the size of one or two fingers; cut off the end, and raise the root sufficiently out of the ground to turn the cut end into the receiver. It will emit the liquor from the wound as freely as by either of the other methods. When it ceases to flow, bury the root again, and the tree will not be hurt.—*Mackenzie.*

FOWLS.

THE advice of the following paragraph is very little heeded by American farmers.—*N. Y. Far.*

The breeders of fowls are well aware of the impropriety of saving a male and female from the same sitting of eggs, if they are to be kept for breeding.

LAMBS.

MANY farmers suffer much from the loss of lambs. It is found in England that balls of wool are formed in the stomach, obtained from the ewe. The wool around the udder should be cut off.

N. Y. Farmer.

A FAT SHEEP.

THE Ontario Repository states that a sheep was slaughtered lately by Mr. Josiah Sutherland, of Canandaigua, from which was obtained forty seven and a quarter pounds of tallow. The wool from this sheep after being cleansed weighed six and a half pounds.

SCIENCE OF AGRICULTURE.

Origin and Principles of Culture as derived from the study of vegetables.—The final objects of all the sciences is their application to purposes subservient to the wants and desires of man. The study of the vegetable kingdom is one of the most important in this point of view as directly subservient to the arts which supply food, clothing and medicine; and indirectly to those which supply houses, machines for conveying us by land or by water, and in short almost every comfort and luxury. Without the aid of the vegetable kingdom, few mineral bodies would be employed in the arts, and the great majority of animals, whether used by man as laborers, or as food, could not live.

Agriculture and gardening are the two arts which embrace the whole business of cultivating vegetables, for whatever purpose they are applied by civilized men. Their fundamental principles as arts of culture are the same; they are for the most part suggested by nature and explained by vegetable chemistry and physiology, and most of them have been put in practice by man, for an unknown length of time, without much reference to principles. All that is necessary, therefore, for effecting this branch of culture is to imitate the habitation, and to propagate. This is, or ought to be, the case, wherever plants are grown for medical or botanical purposes, as in herb or botanic gardens. Nature is here imitated as exactly as possible, and the result is, productions resembling as near as possible, those of nature.

To increase the number and improve the qualities of plants, it is necessary to facilitate their mode of nutrition by removing all obstacles to the progress of the plants. These obstacles may either exist under or above the surface; and hence the origin of draining, clearing from surface incumbrances, and the various operations as digging, ploughing, &c. for pulverizing the soil. Nature suggests this in accidental ruptures of the surface, broken banks, alluvial dispositions from overflowing rivers, and the earth thrown up by underground animals. Many of the vegetables within the influence of such accidents are destroyed, but such as remain are ameliorated in quality, and the reason is that food is increased, because their roots, being enabled to take a more extensive range, more is brought within their reach.

It is necessary, or at least advantageous, to supply food artificially; and hence the origin of manuring. All organized matters [animal and vegetable substances] are capable of being converted into food for plants. But the best manure for ameliorating the quality, and yet retaining the chemical properties of plants, must necessarily be decayed plants of their own species. It is true that plants do not differ greatly in their primary principles, and that a supply of any description of putrescent manure will cause all plants to thrive, but some plants, as wheat, contain peculiar substances, (as gluten and phosphate of lime), and some manures, as those of animals, or decayed wheat, containing the same substances, must necessarily be a better manure or food for such plants. Manuring is an obvious imitation of nature, every where observable by the decaying herbage of decaying plants, or the falling leaves of trees, rotting into dust or vegetable mould about their roots, and by the effect of the dung left by pasturing or other animals.

Amelioration of climate is farther advantageous, in improving the quality of vegetables, by in-

creasing or diminishing its temperature, according to the nature of the plant; unless indeed, it is situated in a climate which experience and observation show to be exactly suited to its nature. Hence the origin of shelter and shade, by means of walls, hedges, or strips of plantation; of sloping surfaces or banks, to receive more directly or indirectly the rays of the sun; of rows, drills and ridges, placed north and south in preference to east and west, in order that the sun may shine on both sides of the row, drill or ridge, or on the soil between rows and drills, every day in the year; of soils better calculated to absorb and retain heat; walls fully exposed to the south or the north; of training or spreading out the branches of trees upon these walls; of hot-walls; of hot-beds; and finally of all the variety of hot-houses. Nature suggests this part of culture, by presenting, in every country, different degrees of shelter, shade and surface, and in every zone, different climates.

The regulation of moisture is the next point demanding attention; for when the soil is pulverized, it is more easily dried by the penetration of the air; when an increase of food is supplied, the medium through which that food is taken up by the plant should be increased, and when the temperature is increased, the evaporation becomes greater. Hence the origin of watering by surface or subterranean irrigation, manual supplies to the root, showering over the leaves, steaming the surrounding atmosphere, &c. This is only to imitate the dews and showers, streams and floods of nature; and it is to be regretted that the imitation is in most countries attended with so much labor, and requires so much nicety in the arrangement of the means, and judgment in the application of water, that it is but very partially applied by man in every part of the world, except in Italy. But moisture may be excessive; and on certain soils at certain seasons, and on certain productions at particular periods of their progress, it may be necessary to carry off a great part of the natural moisture, rather than let it sink into the earth, or draw it off where it has sunk in and injuriously accumulated, or prevent its falling on the crop at all: and hence the origin of surface drainage by ridges, and of under-draining by covered conducts or gutters; and of awnings and other covers to keep off the rain or dews from ripe fruits, seeds, or rare flowers.

The regulation of light is the remaining point. Light sometimes requires to be excluded and sometimes to be increased, in order to improve the qualities of vegetables; and hence the origin of thinning leaves which overshadow fruits and flowers, the practice of shading cuttings, seeds, &c. and the practice of blanching. The latter practice is derived from accidents observable among vegetables in a wild state, and its influence on their quality is physiologically accounted for by the obstruction of perspiration, and the prevention of chemical changes effected by light on the epidermis.

Increasing the magnitude of vegetables, without reference to their quality, is to be obtained by an increased supply of all the ingredients of food, distributed in a body of well pulverized soil as the roots can reach to; of heat and moisture; of the partial exclusion of the direct rays of the sun, so as to moderate perspiration; and of wind, so as to prevent sudden desiccation [drying.] But experience alone can determine what plants are best suited for this, and to what extent the prac-

tice can be carried. Nature gives the hint in the occasional luxuriance of plants accidentally placed in favorite circumstances, and man adopts it, and improving on it, produces cabbages and turnips of half a cwt.; apples of one pound and a half; and cabbage roses of four inches in diameter; productions which may in some respects be considered diseased.

The preservation of vegetables for future use, is effected by destroying, or rendering dormant, the principle of life, and by warding off, as far as practicable, the progress of chemical decomposition. When vegetables or fruits are gathered for use or preservation, the air of the atmosphere which surrounds them is continually depriving them of carbon, and forming the carbonic acid gas. The water they contain, by its softening qualities, weakens the affinity of their elements; and heat produces the same effect by dilating their parts, and promoting the decomposing effect both of air and water. Hence drying in the sun or in ovens, is one of the most obvious modes of preserving vegetables for use, as food, or for other purposes, but not for growth if the drying process is carried so far as to destroy the principle of life in seeds, roots or sections of the shoots of ligneous [woody] plants. Potatoes, turnips, and other esculent roots, may be preserved from autumn to the following summer, by drying them in the sun, and burying them in perfectly dry soil, which shall be at the same time at a temperature but a few degrees above the freezing point. Corn (grain) may be preserved many years by first drying it thoroughly in the sun, and then burying it in dry cool pits, and closing these so as effectually to exclude the atmospheric air. In a short time, the air within is changed to carbonic acid gas, in which no animal will live, and in which, without an addition of oxygen or atmospheric air, no plant or seed will vegetate. The corn is thus preserved from decomposition, from insects, vermin, and from vegetation, in a far more effectual manner than it can be in a granary. In this way the Romans preserved their corn in chambers hewn out of dry rock, the Moors in the sides of hills, the Chinese, at the present time in deep pits, in dry soil, and the aboriginal natives of Africa, in earthen vessels hermetically sealed. The origin of these practices are all obvious imitations of what accidentally takes place in nature, from the withered grassy tussock to the hedgehog's winter store; and hence the origin of herb, seed and root rooms and cellars, and packing plants and seeds for sending to a distance.

The whole of the art of vegetable culture is but a varied development of the above fundamental practices all founded in nature, and for the most part rationally and satisfactorily explained on chemical and physiological principles. Hence the great necessity of the study of botany to the cultivator, not in the limited sense in which the term is often taken, as including mere nomenclature and classification, but in that extended signification in which we have here endeavored, proportionately to our limited space, to present the study of the vegetable kingdom.—*Enc. of Agr.*

FAMILY ALBUM.

We were not long since informed of a practice observed in the family of an excellent widowed lady of this city, which must be of great utility to her children, and which we venture to recommend to the readers of our paper. A folio if we

mistake not is provided as a place of deposit, into which each member of the family is required to put once a week a piece of written composition, upon any subject that may suggest itself to the mind of the writer. Saturday evening the budget is opened and each piece read, criticised, and amended in the presence of the family. It is impossible to calculate the advantage to be derived from such a practice, by establishing in early life habits of investigation, and mental improvement. The mother who thus educates her children, may sanguinely anticipate a maturity of usefulness and respectability. Degrading profligacy, and low vice can have little to tempt a mind thus early shielded by lessons of purity, domestic happiness, and pleasant fire side instruction. Give your children an early love for books, refine their taste by works of art, set them an example of religious excellence, of correct manners, and endeavor to make the domestic hearth always attractive, and you bar up all the great avenues to immorality.—*Portland Courier.*

For the New England Farmer.

THE SILKWORM—A. D. 1655.

The following article, although it is not a very favorable specimen of the poetry or erudition of the age or the country in which it was written will afford amusement to the antiquarian. The rhymes are so incorrect, and the measure so inaccurate that a modern critic could hardly give absolute to the lady-author, were it not that her subject is more interesting than her manner of treating it. A poem, printed in London, about the time that Cowley and Waller were publishing their celebrated productions, might have been expected to have indicated something similar to the style and manner of those masters of the lyre. But the facts which it records and alludes to cannot fail to give it interest, with many readers, notwithstanding its deficiencies, when brought to the test of modern criticism.—*Editor.*

The following poem is taken from a work, printed in London, in 1655, by John Streeter, entitled "*The reformed Virginia Silk Worm, Or, a Rare and New Discovery of a speedy way, and easie means, found out by a young Lady in England, she having made full proof thereof in May, anno, 1652. For the feeding of Silk-worms in the Woods, on the Mulberry-Tree-leaves in Virginia: Who after forty days time, present their most rich golden-coloured silken Fleece, to the instant wonderful enriching of all the Planters there, requiring from them neither cost, labour, or hindrance in any of their other employments whatsoever. And also to the good hopes, that the Indians, seeing and finding that there is neither Art, Skill or Pains in the thing; they will readily set upon it, being by the benefit thereof enabled to buy of the English (in way of Truck for their Silk-bottoms) all those things that they most desire.*"

POEM

Upon the most Noble, Virginian natural Silk-Worm her wonderful, various, plentiful food; The infinite, speedy, great wealth she will produce to her protector; (in 45 days the time of her feeding) with small labour, cost, or skill, (learnt in an hours space by any child.) The singular aptness of that rare Superlative Climate, in Breeding them on so many several kinds of Trees in her Woods where they live, Feed and Spin, their mighty large, strange, double-bottoms* of Silk: To

* This word is synonymous with cocoon, as appears from the following extract from another part of the pamphlet. "The Silk Bottome of the naturall Worme in Virginia, found there in the Woods, is ten Inches about, and six Inches in length to admiration; and whereas ours in Europe have their Sleeve and loose Silke on the outside; and then in a more closer covering they intombe themselves. These rare Worms, before they inclose themselves up, fill with Silke the great emp-

the admiration of this our Old World; but to the exaltation and glory of incomparable Virginia, in the New.

WHERE Worms and Food doe naturally abound,
A Gallant Silken Trade must there be found:
Virginia excels the World in both,
Envie nor Malice can gaine say this troth
Many a man the causes faine would heare,
How these rare Worms came first or still come there.
Insects produced are by heat and moisture
Who in strange shapes and forms do oft appeare.
In Spring our trees the Catrpillers reare;
Their trees likewise these noble creatures beare.
And some proceed from eggs that scaped are
From their enemies sight, which thing is rare.
They feed not only on the Mulberry
Which in our World sole food is held to be
For all such precious Worms of that degree:
But Poplar, Plum, Crab, Oake, and Apple tree,
Yea Cherry, and tree called Pohickery:
So on the Shrubs and Bushes feed full many
Her Worms are huge whose bottoms dare
With Lemmons of the largest size compare.
And twenty one of ours will sure poize less
Then one of theirs for weight and ponderousness.
Master William Wright of Nansumound
Found Bottoms above seven Inches round.
And though the Silk prove not all out so fine
As Persian, that's no let to the designe,
For since a thousand of our Bottoms make
But one pound of fine Silk, you'll ten pounds take
From theirs. If we at Thirty shillings sell
Our pound, for twenty they'll afford theirs well.
The paines that's taken is alike in either
But the gaines by theirs eight times greater:
Then, we confined are to the Mulberry
For food, their Worms have great Variety.
Her dainty coloured flies and large Worms
In length and bigness do surpass men's Thumbs.
Whereas ours short of little fingers come.
Our flies come out in twenty days and lay
Eggs, theirs not still three hundred as they say
O wondrous thing! a Worm to fast so long
And then come out a painted Fly so strong.
Nine months full out our eggs unhatch't remaine
Nine daies in Spring makes theirs revive againe
A Planter (I wish they had him named)
A spoonfull eggs from one fly he gained
Which to five hundred at least amounted
So shortly endless they must be counted.
In March they first begin to live and feed
In April they have done the Silken deed
The sweetest, pleasant time in all the year.
You to this Wealth the chanting Birds will cheare
And ten moneths time they leave you with great ease
To spend it in what profit you shall please.
Rare Worms who feeding five and forty daies
On leaves of sundry Plants and shrubs repaies
Their keepers with fine Silke which wants no strength
And yet extends itself some miles in length
And for the labour of a Man and Boy
They gaine you Sixty pounds which is no toy.
If you from birds protect them on the trees
(Their naturall mansions) 't will them best please
Your paines is spar'd in giving them the leaves
By which alone you gaine their Silken sleeves
For non-parrel Virginia in her Woods,
Brings forth as all men know these precious goods:
Where thousand fleeces fit for Princes Robes
On Virgin-trees shall hang in Silken Globes.
The noble Worm so hardy, strong and stout
No weather ill is able them to rout.
The reasons why the numbers are so small
The Cruell Birds devoure most of them all
When they are Worms, yea Eggs or Silken ball.
Most bottoms likewise on the leaves are spun
Both falling to the ground do perish soon
Those only found that spun are on the branch
Not by their care but providentiall chance
Which only show themselves when all is bare
To find in Summer any 'tis most rare.
If to prevent both dangers you intend
A Reedy-Arbour well will doe't, you'll find

tinesse, and afterwards inclose themselves in the middle of it, so they have a double Bottom. The loose Sleeve Silke is all on the outside of this compass, for if that were reckoned in, the compass of the Bottom would far exceed this proportion: But this is sufficient to be the Wonder of the whole World: to the Glory of the Creator, and Exaltation of VIRGINIA."

Or slightest coverture in any kind
The skill and paines to all each Child can do;
As you shall find on triall tis most true.
And may in Wealth compare with rich Peru.
And for all Tooles that appertaine thereto
A Twelve-penny Reece is all it will cost you,
No wit, no strength, no purse, no stock will need
But eyes and hands, the Worms to guard and feed.
And thus you see is done the Silken deed:
Which brings you so great wealth with so much speed.
Five hundred pounds worth of rich Silk, all know
Freights less than ten pounds in poore Tobacco
Silkes are no trash, no toy, nor Pedlars ware;
Staple, good, and ready chinke every where.
Twenty shillings a pound 't will yield you cleare
And Ships to fetch it will come flying there.
Queenes of the best edition need not scorne
In her owne Livery to serve this Worm:
Only to give her leaves is all she craves
And in reward with Silk shee'll make you brave.
Out of her rich belly by her mouth spun
Weaves it into a most curious bottom
Which by a Reece turning with hand of man
Is wholly wound off most neatly againe
To feed Silk-Worms no Caling can disdaine
Seeing they yeild you so much honest gaine
No imployment in the World so likely
To make so soone your loste Savage Wealthy.
For his Silk Bottoms in exchange shall have
From English, what he so needs, begs and craves
Red coats, hose, shooes, knives, they highly deeme
Jewes-Trumps, Bells, Beads, all toys, no less esteeme.

If all be thus the cause you now demand
Why hath this knowledge been thus long detained
And but now by the Ladies Books inflam'd
Ignorance of Planters so strange hath been
Till now ne're knew nor dreamt of this rich thing
Confest it is, that of 't some they have seene
Regardlessly, but ne're did them esteeme.
Which loss of Wealth & Honour they'll regaine
And Virgins Counsell follow will amaine
The happy onset they this spring have made
Assures them all a stately pretious trade
Sir Henry Chichly that Heroick Knight
Affirms ther 's not an ingenuous Wight
In Virginia but makes all speed he can
To be er'e long a Silken noble man.
And say, Colonel Ludlow certifies
That thence from Silk great profit will arise
Yea worthy Bernard that stout Colonel
Informes the Lady the work most facile
And of rich Silken stuffe, made shortly there
He hopes that he and others shall soon weare
So major John Westrope saith, Silk will be!
A gallant designe for their brave Country.
Thunder was that, that some men onely doubt
But triall made this Spring puts that feare out
In all Lands where Worms are kept tis wonder
To hear that any were harm'd by thunder.
Their naturall Worm proves this more truer
Mr. Gorge Lobs that prudent old planter
Tells her that Worms ne're spun Silk daintier.
Lets give those Gentlewomen their full dues
Mistress Garret and Burbage for Silk clues
That Colonell's Wife need not far to rove
Her Court affords a pleasant Mulberry Grove;
But noble Digs carries the bell away
(Lass! want of eggs made so small-the essay)
His two Armenians from Turkey sent
Are now most busy on his brave attempt
And had he stock sufficient for next yeare
Ten thousand pound of Silk would then appeare
And to the skies his worthy deeds upreare.
Loe here what mistress Mary Ward hath sent
And to her Lady Cosin she presents
Ten rare Bottoms took from her Apple tree
That all England may it beleeve and see.
Her honor'd Kins-man Esquire Ferrar
To confirme and make the wonder greater
Ten more likewise hath sent her, which he found
On stately Oakes, and Shrubs that kiss the ground
And Doctor Russell that learned Physician
Hath with his, made a full addition.
For things more slowly do affect the minde
Which eares do heare then those that ies do find
Now from smoke Virginia shall be raised
And throughout the World be duly praised.
Ah Blest be God that now in his due time
This Silken light apparently doth shine
Then come, Oh come with sacred Lays
Let us sound the Almighty's praise.

J. F.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MARCH 26, 1834.

FARMER'S AND GARDENER'S WORK.

Early Potatoes. It is an object often worth the attention of Farmers and Gardeners, especially those who live in populous places, or near large cities; who wish to make the most of their means, and are willing to take extra pains for extra pay, to raise potatoes for market as early in the season as possible. They thus obtain, perhaps, two or three times as much for the crop as they would, had it been brought forward a few weeks later, and confer a benefit on the public by supplying the market, the fore part of summer, with an excellent article of diet, which is as wholesome in June as in January. Besides very early potatoes are less liable to be injured or destroyed by drought or insects than those which are of late growth; and the land on which they grew may be cleared in season for some other useful product. We will, therefore, endeavor to point out some tried and approved methods of forwarding the growth of this important article of sustenance for man and beast.

An English writer observes, that "It is well known in Lancashire to some, though I believe to very few cultivators of the potato, that different eyes germinate and give their produce, or become ripe at times varying very materially, say several weeks, from each other, some being ripe or fit for use as early as May, and others not till June or July.

"The sets [cuts or pieces], nearest the extremity of the potato [the end farthest from the stem which connects it with the vine] are soonest ripe, and in Lancashire are planted as hereafter mentioned, in warm places in March or the beginning of April, and are ready for market about the 12th or 15th of May. The produce of the next sets, [or the middle cuts between the root ends and top ends] are ready in about a fortnight after, and those from the root [or stem] are still later. These roots and sets are usually put together, and the extremity of the root end is thrown aside for the pigs. The eye of the set should be near the middle of the cut, and a moderate portion of the tuber round each bud is sufficient. In certain parts of Lancashire the potato is cultivated with peculiar care, and some growers shelter the young plants with hurdles and hedges of furze [a thick prickly shrub] here and there to protect them from cold winds, and sometimes even cover them with mats during the night. The sets are there planted in the month of March or beginning of April in drills of twenty-four drills in twenty yards and of sixteen inches to the top of the drill in the following manner. After the drills are formed, loose earth is brushed with a spade, or harrowed down, to the depth of six inches in the interval between them; dung is then placed over this loose earth, to the depth of four or five inches; the potato sets of the earliest degree are then laid on this manure at four or five inches apart for the early crop, and sets of the second degree [cuts from the middle of the potato], at from six to eight inches apart, for later crops, and so on.

"The sets for the early crop are then covered with a spade to the depth of two inches, and subsequently covered at two or three different times to the depth of about five inches. The second and third crops are usually covered with the plough.

"Some lay the potatoes intended for plants early in the year before they are wanted to be cut for planting, loose and separate on straw, or on warm boarded floors, and others put them on frames in warm situations near the fire for the same purpose, in order that they may sprout, and when so sprouted to the length of half an inch or an inch they are then carefully cut as described, assorted and planted.

"Some of the growers, who take great pains in the early production of this potatoe, [called the Lady's Finger, or Early Rufford Kidney Potato] obtain in Manchester market two or three shillings per pound, and from their delicacy they are worth the money.

"That part of the potato near the root end is of no use whatever for seed or plants, yielding only stems, and small sets not worth cultivating. In cutting the sets this part is usually thrown into a fourth vessel and given to the pigs."

R. W. Gard. Mag. vol. 1. p. 405.

M. Saul, another writer for the same work on the same subject directs to "put the potatoes in a room or other convenient warm place about the end of February, [March or fore part of April] cover them with a woollen cloth, for about four weeks, then take it off, and by so doing you will make the sprouts much stronger. Towards the latter end of March, [April] set them, covering the sprouts about two inches deep. If the sprouts be about two inches long when set, the potatoes will be ready in seven or eight weeks afterwards.

"Another friend of mine, who has a green house, adopts the following plan. He places the potatoes in the green house, in turf mould, or peat earth in the beginning of February, and keeps them well moistened with water; he plants them in the open air about the end of March on a warm border, leaving about half an inch of the point of the sprouts above the ground, and protects them during nights by coverings of mats. By this plan he is able to have new potatoes about the beginning of May. It is considered a very material thing to get the potatoes well sprouted before they are covered."

The Conductor of the Gardener's Magazine observes that "In some parts of Scotland, it is customary in preparing the sets both of early and late potatoes to begin by cutting off and throwing aside for the pigs the two extremities of the potato: that full of buds as being apt to run too much to haulm, and the root end, or that in which there are none." This method of preparing potatoes for planting has likewise been recommended by Judge Buel, and other American Cultivators.

In Denbighshire (Eng.) the potatoes intended for seed for the following year are taken up before they are ripe, just when the outer skin peels off, and before the stem or vine begins to wither; they are then laid on a gravel walk, fully exposed to the sun, for a month or six weeks, when they become quite green and soft as if they were roasted, and often much shrivelled; they are then put away, and protected as other potatoes are. In February they are examined, when every eye is generally found full of long sprouts fit to be planted. Only two sets are made of each potato, the eye or top part, and the roots or bottom part. They are separated as in Lancashire, and then planted in the common potato-ground; the top sets are earlier by a fortnight than the others.—Gard. Mag. vol. ii. p. 172.

A writer for the Edinburgh Scotsman observes

that he has "ascertained by frequent experiment not only that sets cut from the top end of the parent potato were fit for the table about a fortnight earlier than those cut from near the root, though both were planted the same day, and had the same management," but "when the root end of the potatoe is planted with the others, in the course of a few years a very considerable degeneracy ensues." This if correct is important, as we know our best kind of potatoes have greatly deteriorated, and by finding the cause of course we may probably remedy the evil. It can hardly be necessary to remind the intelligent cultivator that if he wishes for early potatoes, his seed must be selected from the earliest varieties.

THE MASSACHUSETTS LEGISLATURE

—Is expected to close its session shortly, and we shall thereby be deprived of a beneficial intercourse which we have had the happiness to enjoy, since the commencement of the present term, with many of its members. The number of our papers taken by members of both Houses during this session has been greater than at any previous period of the same length, since the establishment of the New England Farmer. We hope an acquaintance so auspiciously commenced will not have a speedy termination; and beg leave to suggest a method for its continuance. If the gentlemen alluded to will be so kind as to step or send into our office, No. 52 North Market street and leave each a small deposit of \$2,50, we will forward to their respective places of residence the N. E. Farmer for one year therefrom. In this way according to our calculation, they will soon receive again not only the value of their said deposits, but at least cent per cent per annum, in weekly payments on the capital sum thus expended. They will moreover benefit their constituents, by being instrumental in the diffusion of that knowledge, which is wealth as well as power.

TO CORRESPONDENTS.

A GENTLEMAN whom we highly respect writes that he has "the prospect of being able to obtain a small parcel of Gama Grass seed. If you are possessed of any information which would enable me to turn to the best account the small quantity of seed which I may be able to obtain, I should esteem it a special favor if you would communicate it."

The most full and apparently accurate notice of the grass which we recollect to have seen was from the Fayetteville, (N. C.) Observer, republished in the New England Farmer, vol. xii, p. 34. The writer observes as follows:

"I have ascertained the following facts with certainty. That it grows spontaneously and luxuriantly in our country on alluvial bottom, and rotten lime-stone lands. I have planted it in a poor sandy loam on a clay foundation, (such as is the general quality of the stiff pine lands of our country,) and in a sand hill originally as barren and as arid as the deserts of Arabia. These soils well manured produce it abundantly. Even the long drought of 1822 (which with me continued from the 23d of May to 1st of August, with the exception of one slight rain on the 9th of July, did not materially affect its growth. It may be cut as early as the 15th of May, and the cutting repeated every thirty days until frost. It ought to be planted in drills three feet apart and two feet space

between the rows. An acre will then contain 7,350 roots. A single root of the second year's growth, (in the dry sand hill,) at three cuttings, has this year already yielded 7 1-2 lbs. of green hay, and will without doubt, yield at least as much more before frost. At that rate an acre of pure sand-hill, well manured, would yield 15 tons of cured hay, of a quality as good as the best blade fodder."

We have received a transcript of the remarks of the Rev. Mr. Allen of Pembroke, Mass. in the Legislature on a proposition to revive an act for the encouragement of Agriculture and Manufactures. We think them able, pertinent and interesting, and regret that we are under the necessity of postponing their publication to our next.

Other favors remain to be acknowledged, and requests to be complied with, which shall meet due attention as soon as possible.

ITEMS OF INTELLIGENCE.

Early Ploughing. Some farmers began to plough in Northampton meadow on the 17th inst.—*Hampshire Gazette*.

An "entire Swine." Mr. Sable Rogers of this town, on Thursday last butchered a *Shoat* which weighed, after being dressed, seven hundred and eight pounds. The age of the animal was two years, and the clear pork through his back measured nine inches in thickness. It was "a wonder unto many" of the U. S. Bank men, how this Swine could become so unusually fat, in these times of "pecuniary pressure and distress."—*Springfield Whig*.

A Thunder Storm of great severity occurred in Boston and its vicinity in the night of the 20th inst. In Randolph, Mass. a house was struck with lightning and considerably injured, the electric fluid passing down near the chimney, and almost destroying a room in the lower story. No person in the house was injured.

AMARYLLIS FORMOSISSIMA, Or Jacobean Lily.

This is a very magnificent flower. It throws out gracefully its glittering carmine-coloured petals, which have a brilliancy almost too intense for the eye to rest upon. It must be planted in a clean, new soil, naturally rich: take some from under your grass plot, and mix in a little sand. Plant in April or May, in a pot, or in the open ground in a sunny situation: place the root so that the highest point is not more than one inch below the surface: it will flower in July and August, and will well repay the little trouble of putting it into the ground. In November cut off the stalk, take up the root, and after drying it a few days, pack it in dry sand, and put it in the cellar, to keep it from the winter's frosts. Just received and for sale by GEO. C. BARRETT, New England Seed Store. m 26

WANTED

A few hundreds of handsome engrafted Cherry Trees.
Apply at this Office. m 26

10,000 WHITE MULBERRY TREES.

For sale by ABEL NICHOLS, DANVERS, 10,000 White Mulberry Trees of vigorous growth, two years old, and received the first premium of the Essex Agricultural Society. Orders sent at this office will be attended to. m 19 p tf

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,
1 Case wet (but not damaged) Bishops Lawns.
1 do. do. do. Book Muslin.
Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation.
March 14, 1834.

GOOSEBERRY BUSHES.

25 Varieties fine imported Gooseberry bushes, just received from Scotland. GEO. C. BARRETT. m 26.

THE ALBANY NURSERY,

Is now supplied with a large assortment of Pear trees, in addition to its general assortment of Trees and Shrubs, which embraces most of the kinds on demand. Price 37 1-2 cents. Its collection of *Dahlias* contains more than 300 fine double varieties, and is surpassed by none in the Union. Orders will be received by GEO. C. BARRETT, at the N. E. Farmer Office.
BUEL & WILSON.
Albany, March 7, 1834. 41.

SITUATION WANTED.

A young man with a family, who is well acquainted with taking charge of a Farm, wishes a situation as foreman. Good recommendations will be given. Inquire at this office.

SITUATION WANTED.

A middle aged man wants employment as a Gardener or Farmer; or will attend to them both if required, which branches he has been acquainted with for many years in England and America. He possesses the most unqualified recommendations. For particulars apply to the Rev. Mr. Neal, South Boston; No. 223 Hanover Street, Boston, opposite the Globe Hotel; or No. 165 Ann Street. m 19

APPLE TREES FOR SALE.

3600 budded Apple Trees, consisting of Baldwins, Russets, Siberian Crab, Porter, River, Rhode Island Greenings, and Blue Pearmain. The above are very thrifty Trees, and in fine order for transplanting, being four years from the bud. Inquire of JONAS WYETH, Fresh Pond Hotel, Cambridge. March 13, 1834. 81

BRIGHTON NURSERIES.

MESSRS. WINSHIP have received by the Morea, the following new kinds of Gooseberry Plants, in addition to those before advertised:

Reds.—Pearsons Marksmen, Manchester Ashton Seedling, Warrington red, Sportsman, Crown bobs, Leyfroh's seedling, Rider's Old England, Achilles.

White.—Hall's conqueror of England, White Smith, Duke of York.

Green.—Green Walnuts, Jolly Tar, Sovereign, Moor's Liberty.

Yellow.—Nonesuch, Trafalgar, Prince of Orange, Yellow Sulphur.

—Also—
Purple Beech Trees; Linden, and other varieties of Limes; Scotch Larch; Double and Scarlet Flowering Hawthorn, Moss, Sweet briar and other double flowering roses. Spireas, Clematis, Honeysuckles of various new kinds Rhododendrons Arboreum hybridum, Catawbiense, and Ponticum, with many other new and rare plants.

Orders for the above or any other nursery productions, may be left with G. C. BARRETT, Agent, No. 52 North Market-st., Boston, or forwarded to Messrs. Winship, Brighton, Mass., by mail or otherwise. Orders will be despatched immediately, if requested.

Catalogues for gratuitous distribution, at the New England Farmer Office and Seed Store of G. C. BARRETT. m 26.

PAINT OIL.

The subscribers keep on hand a constant supply of their "Prepared Paint Oil," which is offered for sale with renewed assurances of its merit. This Oil, independent of being 25 per cent. cheaper in price, will actually cover a quarter more surface, as has been repeatedly proved and confirmed by statements of many Painters. Upwards of 200 buildings in this city and vicinity can be referred to, many of them painted two years ago, which continue to look well, and retained their gloss through the first year, which is a clear demonstration of its strength. The Prepared Paint Oil is found to answer a valuable purpose to mix with Linseed Oil, giving it strength and durability with a more permanent gloss. It paints a very clear white, flows smooth, and is more free from mildew, and changes resulting from the sea air, than any other Oil.

Oil Factory (head Foster's Wharf.)

DOWNER & AUSTIN.

P. S. Please be particular to order Downer & Austin's "Prepared Paint Oil." m 19 6pis.

FARM FOR SALE.

Situated in the South Parish in Andover, little more than half a mile southwesterly from Phillips' Academy and the Theological Institution, and about one mile from the Rev. Mr. Badger's Meeting-house,—containing about forty acres of valuable land, being the choice part of a much larger farm—having thereon one large and convenient two story dwelling-house, finished and in good repair, lately occupied as a boarding-house.—Also, near it, a one story dwelling-house in good repair. Also a barn ninety feet long, sheds, wash-house, wells of excellent water, gardens, fruit trees, &c.—A very eligible situation for any person desirous of retiring into a pleasant country town for the purpose of educating his children. The above valuable estate will be sold at public auction on Tuesday the first day of April next, at 3 o'clock P. M. Conditions of sale liberal. SAMUEL FARRAR.
Andover, Feb. 24, 1834.

WANTED,

An active, industrious man, of energetic character, capable of taking charge of the digging, hoeing, and other culture of an extensive nursery. His business will be to work with and direct four other laborers; which four others are also wanted, and may be selected by him. All must be New England men; and as they are wanted as speedily as possible, applications made immediately by mail will be promptly replied to. It is useless for any person to apply who is not precisely of the character above named. WM. PRINCE & SONS.
Linnæan Garden, Flushing, March 10, 1834.

N. B. 500 lbs. superior Italian Rye Grass—50 bushels Paçey's superior Perennial Rye Grass—and 200 lbs. Trifolium incarnatum, for sale as above. 21 m 19

BRIGHTON MARKET.—MONDAY, MARCH 24th, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day 375 beef cattle, 12 pair of Working Oxen, 10 Cows and Calves, 150 Sheep and 600 Swine.

PRICES. Beef Cattle—Last week's prices were not supported; our quotations will show a small variation. We noticed a few extraordinary fine cattle taken at \$6. We quote prime at 5 33 a 5 75; good at 5, a 5 33; thin at 4 50 a 4 88.

Working Oxen—We noticed sales at \$70, 80, 85, and 110.

Cows and Calves—Sales were effected at \$19, 23, 25 and 28.

Sheep—Sales not known.

Swine—In demand: lots were taken for 5c for sows, and 6c for barrows; also at 5 1-4 and 5 1-2 for sows and 6 1-4 and 6 1-2 for barrows, at retail 6 for sows and 7 for barrows.

EARLY POTATOES.

A few bushels Early Potatoes for Seed; the same kind which received the premium of the Mass. Hort. Society, for 4 years past. For sale at the New-England Seed Store, by GEO. C. BARRETT.

MISCELLANY.

MIXING OF FLOUR AND SUGAR, MILK AND BUTTER, &c.

The following is taken from the Southern Planter, and, as the writer says, involves much science in connexion with the explanation:

Mr. Editor, A gentleman came to my house to spend a night with me. I put a spoon-full of wheat flour and a spoon-full of inferior brown sugar in my marble mortar and stirred them well together, and next morning desired his opinion what it was; he examined it and pronounced it sugar of a superior quality. When informed that it was half flour, he could scarcely believe it, but wanted to know if a better judge would be deceived in the same way: another spoon-full of each was prepared in the same way, and carried twenty odd miles to a man whom he supposed would be a very good judge. I knew myself that he was raised a merchant and accustomed to deal in the article: he also pronounced it very superior sugar. Such is the fact, that one spoon-full of flour and one of sugar, thus prepared, will taste and look exactly like sugar; and that if the sugar was rather dark colored, it will improve the looks; not only so, it will sweeten as much coffee as two spoons-full of sugar; in fact, it will be two spoons-full of sugar.

If one cup have the sugar put in it first, then the coffee and then the milk, and in another cup one-third less sugar be put, then the milk, and then be well rubbed together with a little pestle, and then the coffee be added, the last will be found as sweet as the first, although it has one-third less sugar. If the sugar is put in first, then the milk, and then be well stirred with a spoon before the coffee is added, it will require a third less sugar, and the taste will be much superior to coffee made by adding the milk after the coffee is potred on the sugar.

If a pint of fresh rich milk is made blood warm, and a pint of butter be put in it, and then be stirred well until cold, a quart of butter will be made, that will look as well and butter as many biscuits as a quart of butter. This butter thus prepared has one defect—it will not keep: but it has one quality that should balance this defect: when our butter is quite salt, by preparing it in this way, it is one half less salt, and much more palatable.

When butter is to be made, if a little old butter be put in the cream, the butter will come from much less churning. When soap is to be made, if a little old soap be put in the ley and grease, the soap will be made by considerably less boiling.

The conversion of molasses and water is made quickly into beer by adding a little old beer to it. A little yeast being added to flour makes it all ferment, and if a little of this fermented mass be added to more flour, it makes it ferment also, and then a little yeast by proper management would in time convert all the flour of the earth into its own nature.

RICE PORRIDGE.

The following method of cooking rice, more especially for the sick who may be confined to a vegetable diet, has been found very useful, and less likely to cloy the appetite than some other preparations. We believe it has not yet found its way into any book on cookery.

Take a wine-glass of rice well picked and washed, and put it into a sauce pan with a pint of cold water. Boil it one hour or more. Pour it into a

bowl and add a table spoonful of cream (with a little lump of butter for those who desire it), and season it with salt.—*Amer. Farmer.*

CLEANLINESS OF THE DUTCH.

As to cleanliness every dwelling-house is a model and a pattern; they seem to vie with each other in this point. The cow house is pure and clean, not a particle of filth being to be seen in it; the cows are as clean as if they were in a dining room; the milk and cheese houses, and in short every part of the house, are free from dust and dirt of any kind; the manure is placed at a convenient distance from the cow-house, behind the house, and every particle is carefully collected together. The whole apartments, even the byre and hay house, are generally under one roof; and the cleanly system, and the admirable arrangement, give that comfort and pleasure which are too often wanting in this country.

HOW TO GET INTO PRACTICE.

A RECENT number of the *Charivari*, Parisian Journal, contains a striking lithographed portrait of the late eminent Doctor Portal, and makes a brief reference to the mode by which he at first attained celebrity, as recounted we understand, by himself. It appears that one of the principal expedients resorted to for that object by the Doctor was to hire a certain number of equipages, cabriolets, fiacres, &c. which arrived in constant succession at the door of his house throughout the day. Another branch of the mystification consisted in his employing men to repair to his house after midnight, and to knock with such haste, violence, and loudness, as to alarm the neighbors. That point attained, the Doctor appeared himself at the window to demand the cause of the disturbance, when the agent below would suddenly reply, 'Sir, it is the Prince A. the Dutches of B. the Marquis of C. or the Countess of D. who requires your immediate attendance.' So constant and annoying was this system found in the neighborhood, that the Doctor was not allowed to remain lodging in the same house for more than six months; but contemptible as was the trick, it answered the end of its contriver, for Dr. Portal became ultimately physician to Louis XVIII. and Charles the X. and their courts respectively.

A SPEED OF FORTY MILES AN HOUR.

—WITH a light load, has been obtained upon the Manchester railway: and Mr. G. Stephenson, the engineer, has stated his opinion that an engine might be constructed to run 100 miles within the hour, although he acknowledges that "at that rapidity of motion the resistance of the atmosphere would be considerable." Engines are now made with eight times the power of the Rocket, yet with little more weight resting on each rail, the load being equally divided upon six wheels, and the machinery placed in a more advantageous situation than formerly. The tubes of the boiler are made smaller and more numerous, and of brass instead of copper.—The last engine put on the railway ran 23,000 miles with the most trivial repairs, taking every day four or five journeys of thirty miles each.

The great Pyramid of Egypt cost the labor of one hundred thousand men for twenty years exclusive of those who prepared and collected the materials. The steam engines of England worked

by thirty-six thousand men, would raise the same quantity of materials to the same height in eighteen hours.

REDUCTION IN PRICES OF TREES, &c.

WM. PRINCE & SONS have determined in consequence of the pecuniary pressure, to reduce the prices of a great variety of Trees and Plants, where orders are sent for a considerable amount: and all persons who desire Fruit and Ornamental Trees; Flowering Shrubs and Plants; Greenhouse Trees and Plants; Splendid Dahlias; or Seeds—will on applying to them direct by mail, with a list of the articles wanted, be promptly furnished with a printed sheet explaining the reduced rates.—The Chinese Mulberry, or *Morus multicaulis* are now reduced to \$25 per 100, and \$44 per dozen.—Apple trees in great variety \$20 to \$25 per 100.—Pears \$37½ per 100, and extra large ditto 50 cents each; and 60,000 are two, three, and four years grafted.—Peaches \$20 and 25 per 100.—Large Orange Quinces \$30 per 100.—English and Spanish Filberts \$25 per 100.—Fine Red Raspberries \$6 per 100.—Large Red and Yellow Antwerp \$16 per 100.—Gooseberries, finest Lancashire varieties \$20 per 100; and Large Red White and Black English Currants \$16 per 100.—Isabella Grape, 3 years old vines \$25 per 100, and 2 years ditto \$20 per 100.—Catawba, Alexander, Winue, York Claret, York Madera, and Scupperuon, \$25 per 100.—Herbmont's Madeira, Troy and Elsingburgh, \$30 per 100.—Norton's Virginia Seedling \$35 per 100.—The collection of choice European Grapes is unrivalled.—Chinese Ailanthus, 4 feet high, \$4½ per dozen and larger sizes in proportion.—A reduction is made on a great many kinds of Roses, Pæonies, Chrysanthemums, &c.—Double Dahlias of such fine assorted kinds as have been most increased, will be supplied at \$3, \$4 and \$6 per dozen, according to excellence, and selected by ourselves. The roots can be sent to any distance.—The new varieties of Flemish and English Pears having been introduced by us and greatly increased, the prices of the greater part have been reduced, and the trees are mostly of fine size and three years ingrafted.—The Ornamental Trees and Shrubs of most kinds are large and thrifty, and of double or treble the value of smaller ones, which is a most decided advantage, being a gain of several years in embellishment.

N. B. Having no Agent at Boston, the Commission of 10 per cent. usually allowed for Agency, will be credited to the purchasers, and be deducted from the amount of the bills rendered. The stock of Dahlias being so very large, they will be furnished on the most favorable terms possible. Linnean Botanic Garden and Nurseries, Flushing, near New-York, Feb. 10, 1834. }

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK IN NEWTON, 5½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus multicaulis* or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with Geo. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

GOOSEBERRIES.

A new importation of superior kinds, just received, of all colors, by WM. KENRICK, Newton.

LEGISLATIVE BOUNTY FOR THE ENCOURAGEMENT OF AGRICULTURE.

WE are happy in being permitted to publish the following *Remarks of the Rev. M. ALLEN of Pembroke, in the House of Representatives of the Legislature of Massachusetts, on the proposition to revise "An Act for the Encouragement of Agriculture and Manufactures."* The benefits which have been derived, and may still be anticipated from Agricultural improvements are happily exhibited in these remarks, and presented in points of view which are so illustrative of their truth and importance that one would suppose that no opposition could exist to observations so pertinent, founded on facts which admit of no doubt, and arguments too conclusive to leave room for controversy,

MR. SPEAKER,

The friends of agriculture are called upon to give reasons why this branch of interest should be encouraged by any bounty from the government. Living on an elbow of the commonwealth, where much of the soil, from the bend or some other cause is thin, and not convertible without considerable labor and expense to a state of productiveness, it cannot be reasonably supposed, surrounded as I have been with discouraging circumstances, that I should have acquired any very extravagant ideas of the extensive utility and importance of this art. I have, however, habitually regarded the agricultural interest as one of the highest importance. I have supposed it occupied a similar place in the interests of a community with the great luminary above us among the heavenly bodies; that it stood in the centre giving motion, activity and energy to every other branch of interest. While the correctness of this view will not be denied, it may be doubted and on various pretexts, whether any direct encouragements are proper or expedient on the part of government. It is said, let every interest in society find its own level. Plausible as such a position may seem to some minds, the practical effect of it would be, to put an end to a very large portion of the legislation of this house, and bury from our sight some of the most important objects for the accomplishment of which government is instituted.

Laws are framed to encourage and foster various interests, through different means, yet some benefits are always contemplated in your interpositions or they would not be so often and earnestly asked. The direct bounty of the government has often been extended to undertakings of great expense, which gave promise of extensive benefits or improvements. If the propriety of every such grant be now questioned, if it be supposed that all interests will attain the just measure of influence and command all the attention and labor required by the wants or honor of a community without protection or patronage, the supposition, it seems to me, must be made by men who have taken at least one convulsive leap in the march of mind. There are branches of interest which demand occasional and special encouragements; there are others which every wise and patriotic legislature will always keep in view and extend to them parental care and solicitude. It appears to me, sir, the proposition now on the table

relates to an interest of this sort. The fruits of agriculture are every day blessings, and may be enjoyed like the shinnings of the sun without much thought or reflection. But the man who does think at all on the labor and skill which are necessary to make the earth fruitful, cannot for a moment doubt the propriety of presenting all reasonable motives to engagement in labor and inquiry. This art is not like some other arts of life, it is not one that can be perfected in a brief apprenticeship; it is encompassed with deep mysteries which are continually developing and probably will through all succeeding generations. When we think a discovery is made, it is necessary for us to pause and test the fact by often repeated and not unfrequently expensive experiments. We reach the truth here as we do on many highly important subjects, by gradual and slow advances. None of the discoveries we make are immediately followed with so ample pecuniary rewards as discoveries in some other arts. The products of this art being necessities of life, they should be cheap and easily obtained by every class of men; and the public will always keep them cheap in comparison with many other articles of traffic, and therefore is bound to present some motives to excellence in the practice of this art that might not be proper in relation to some other arts. These views seem to me, sir, to present the subject of agriculture as deserving of legislative patronage. In accordance with this opinion have been the sentiments of the most distinguished men and firmest patriots of ancient and modern times. The best days of ancient republics were distinguished for eminent skill and industry in the cultivation of the soil. The glory of those governments began to decline, and rapidly declined as soon as candidates for public offices shrank from the grasp of the peasant's hard hand. In our own country, the man against whom even malice once dared not utter a censure, but whose maxims both political and prudential may now be too much forgotten, never lost sight, either in storms of war, under the unexampled pressure of an immense national debt, or the more unconquerable conflicts in party politics, of the vital, the all pervading interests of agriculture. He embraced every suitable occasion of recommending the encouragement of it in the distribution of premiums, in the diffusion of practical knowledge, and in the employment of all proper means of exciting emulation on a subject of primary importance to individual and national welfare.

The late governor of the commonwealth, who, to many other excellencies of character, united that of an excellent practical farmer, on several occasions, with great earnestness commended this subject to the kind notice and patronage of the legislature. At a time, sir, when your financial concerns were in a very depressed state and he was anxiously looking for the point where retrenchment in expenses might properly be made, he said to take away the bounty from agricultural societies would be the most unwise policy. Those bounties he affirmed, had "diffused a spirit of improvement from the treasury office to the remotest parts of the commonwealth. No public bestowment was ever more faithfully applied, and none will be found to have made richer returns to the source

from which it was derived, it is a measure of political economy, it has yielded annually an hundred fold its amount in the increase of taxable capital."

The experience of every country that has made the trial justifies the encouragement of this kind of industry by liberal bounties. It has been said of a nation, distinguished for its manufactures and commerce, and not less so for the excellence of its agriculture, that without the interposition of its government for the encouragement of the last named branch of interest, there must long since have been a famine there, which could not have been relieved by any timely importations. We, perhaps, look at the extent of our territory and conclude there never can be extensive scarcity in a country embracing so many climates. I hope such a conclusion may be realized, but think it will be wise and patriotic in every community to employ the means of an independent existence. I know some of our citizens are of the opinion that we can import corn from other states cheaper than we can raise it. Well, sir, I suppose we could import our laws from other countries cheaper than we make them here. But neither imported corn nor laws are so good for us as the domestic growth. Wise policy will lead us to live as independently as possible on other communities; and for this purpose we should encourage by all suitable means every branch of social interest. The farming interest demands special encouragement, because it is not only unobtrusive in its character, but to some minds uninviting if not repulsive.

Our young men had rather with delicate hands make figures behind a counter, sort bank bills and receive good salaries for those clean services, than study into the mysteries of nature, or bend the nerved arm in the field of cultivation; but without the last service the first could amount to very little; humble as the condition of farmers may appear in the eyes of many, they are a cumulative class in the community; those branches of business which have so much attraction in the eyes of young men, and which are drawing multitudes of them, I am sorry to have occasion to say it, to the death gate of earthly prospect; those occupations must all languish on the decline of agriculture. Leave this interest exclusively to the direction of men who neither know nor desire to know any paths besides those which their fathers travelled, who are willing always to govern themselves by the simple though scanty instruction given by tradition; leave it with men who ridicule inquiry and reading on the subject, who think the earth can always make discounts without deposits, leave it to the disposal of the sordid temper; and the time cannot be far distant when your most valued institutions will assume the countenance of decline, and your republican government, the boast of the age, present unequivocal symptoms of an approaching suicidal dissolution.

I cannot think you would be disposed to leave this interest to chance, when you consider its inseparable connexion with all other interests in community, the moderate gains that must always be realized; and especially when you contemplate the improvements that have been effected under the encouragements presented in the act which we now desire renewed. Are we asked what has been

effected under the encouragements presented in the act which we now desire renewed. Are we asked what has been done to justify the continuance of the bounty heretofore given, what improvements have been made? We first respond in the yankee style, and inquire where improvement has not been made? Has not the face of the whole country been changed within the fifteen years that bounties have been offered for agricultural excellence? I know there are yet some men who can sneer at the idea of connecting science with an ordinary business of life. But even these men, against their professed principles, are often seen following in the track of theorists, and adopting methods suggested by them.

Like other wise measures of government, this encouragement has reached and influenced every man in the community who cultivates a field. This will be doubted by no man, who will compare the manner in which his labor is now performed, and the amount of crops, with what he did and what he received twenty years ago. Your encouragements have called into action the inventive genius of mechanists; the implements of farmers have assumed a new and highly improved character, they begin to look like the new invented instruments of the surgeon for the extraction of teeth, they begin to invite work.

To the fostering hand of Government which has been extended to Farmers, we justly ascribe the continuance for nearly twelve years of a periodical paper, devoted to the instruction and welfare of this class of men. For before men were awakened to the importance of this occupation, its importance in the estimation of the Legislature, every attempt to establish a journal for the benefit of the farmer had proved an entire failure. Now he has before him eleven volumes of the *New England Farmer*, forming a valuable text book, and no man in any profession should be without his text book. Reading only a single hour in a week every farmer can receive light and guidance in his path. We may begin to hope, and do hope, it will soon become as ridiculous for farmers to neglect their books as it was once considered for them to read.

It has already been suggested that the soil of the country, from which I came, is not the most favorable for agricultural pursuits. The expense of cultivation there is thought by some to exceed the amount to be derived from it. This was a prevalent opinion before the introduction of modern improvements. The operations of an agricultural Society have proved that labor and skill can make even despised soils productive. I suppose ten bushels of rye to the acre, twenty of Indian corn, one ton of English hay, and two hundred bushels of potatoes were formerly considered as average crops. Since premiums have been offered, we have claims for from forty to fifty bushels of rye, from one hundred and fifteen to an hundred and twenty-two of Indian corn, from three to four tons of English hay, and from four to five hundred and fifty bushels of potatoes. Our improvements have not been confined to single acres, in several instances the products of entire farms have been more than quadrupled. There has been reclaimed from a useless state, land covered with briars and bushes, about one hundred acres, for which improvements premiums have been given, besides many operations on a smaller scale, for which no claims were made. This single branch of improvement is worthy of some atten-

tion. The conversion of one or two hundred acres from a state in which it was worth little more than five dollars the acre, to a state in which it is worth seventy-five, makes some difference in the wealth of a county. It would, sir, make some difference in your Treasury, should you ever again have occasion to draw a tax from us.

The attention of the Society has not been exclusively confined to improvements directly affecting the present generation; but they have labored to provide for the convenience and comfort of those who will hereafter occupy their places. Encouragements have been held out and considerable has been done in the work of sowing forest seeds, and thus preparing extensive barren lots to produce a future supply of wood and timber.

In compliance with the law of 1829, we have encouraged the raising of mulberry trees, and some progress has been made in that work. Premiums have been paid for between seven and eight thousand trees, and probably as many more are in preparation to form subjects of future claims. Something has been accomplished in the work of raising silk; at the last annual meeting one person exhibited more than three pounds of well wrought sewing silk, and several persons smaller quantities. The little, but useful manufactures of the family, have been noticed and recorded to an extent that has revived female industry, which had long been languishing under the shadow of large manufacturing establishments.

Speaking of improvements that have been effected in the county of Plymouth, I am aware, they must be regarded as inconsiderable in comparison with those of more favored sections of the Commonwealth. You will not, sir, this house will not be restrained in their views of the extent of improvements in agriculture and the propriety of continuing encouragements by what has been accomplished in a county where a large portion of the inhabitants are continually diverted from agricultural pursuits. You witness far better results of scientific exertion and more astonishing products of the earth than any of which I have spoken. But, sir, you do not, you cannot believe this art in a state of perfection. Would you now withdraw your assisting hand and abandon a work when the glory of it has not yet risen half the distance towards its meridian height? Would it not be withholding more than is meet, tending to poverty? I am persuaded you would so judge, persuaded the enlightened minds of this house cannot be carried away by the vague notion that every sort of business will find its proper level. The gentlemen have heard of the effects, the saving effects in other countries of bounties from government to encourage the prime art of human life. They see in this country the State of New York travelling before every other State in the Union, in its agricultural products. And why? Is it because its territory is extensive and yet comparatively new? Is there not another reason for the result; have not the ten thousand dollars, which the Legislature so early distributed there for the encouragement of agriculture, had much influence?

Are gentlemen afraid of holding out any special encouragements; can they point to any country where those extended to agriculture have occasioned any harm; have they not on the contrary proved blessings to the whole people?

If there be gentlemen satisfied with the more ample rewards of their chosen occupations, who feel disposed to overlook the humble business of

cultivating the earth, if they regard it as the least honorable employment, I would remind them that what is said of the natural body may also be true in the community; the most feeble members are necessary and the less honorable claim special tokens of care and kindness.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FLOWERS.

Horticultural Hall, March 29, 1833.

THOMAS MASON, Charlestown Vineyard, Rhododendron hybridum, Celsia cretica, Pæony, Verberna stocks of kinds, Geraniums, and other fine specimens.

S. WALKER, Roxbury, Viola grandiflora, Carter's Prince of Orange. JONA. WINSHIP.

THE following letter was presented and read by Gen. H. A. S. DEARBORN, President of the Society, who observed that it had miscarried and had recently come to hand, which prevented its having been sooner communicated.

Cincinnati, Nov. 30th, 1833.

DEAR SIR, The favor of the 31st ult. was duly received. I was gratified by the favorable opinion you expressed, of the wine I sent you, for your Horticultural fair; the more so, as I was apprehensive of the wine sustaining injury, from transportation in the heat of summer, no spirit having been added to it, which I believe is the case with all the Rhenish wines sent to this country. Even the Boker Cabinet wines, I am confident have over five per cent. of spirit added. The reason so many of our manufacturers of wine from the grape have failed, is this: Instead of making an American wine, such an one as the must will under a skilful management during the process of fermentation produce, they medicate their wines, and attempt an imitation of foreign wines, in repute among us. On my suggesting to Major Adlum this objection to his wine, he readily admitted it, but told me he was compelled to pursue that course, to insure a sale for his wine. As selling is a secondary consideration with me, it will not influence my course. The wine sent you was the natural product of the must, without racking, fining, or any of the processes of sulphuring, &c. to prevent injury by a renewal of the fermentation.

From another native grape, a year since, I made a wine, greatly resembling Madeira, and with age and the addition of brandy, would not readily be told from it. This fall, I fermented the same grape on the skin, and the product resembles the Triete Madeira. Of this I will send you a sample next summer, though I by no means consider it a fair sample of what the grape will produce, having had so few of the grapes both seasons, as to make one gallon of wine only, and all vintners know the difficulty of making good wine on so small a scale. The grape is a fine bearer, and superior as a table grape, to any native grape with which I am acquainted. My wine this season, from the same grape with that I sent you, should exceed it in quality, as the grapes were better matured. It is, I think, a mistaken impression that our grapes are greatly deficient in the saccharine principle. In France, sugar is frequently used, and in France and Madeira a system is pursued equivalent to it. The grapes are allowed to hang till too ripe for eating. The old rule in Madeira was, not to gather the grapes, till you could gather a bunch of

raisins. In the latter island, brandy is always added, and in both places, a course pursued equivalent to the addition of sugar; drying a portion of the grapes, boiling a portion of the must, and adding so much spirit to a portion of the must, as will prevent its fermentation. The must of the dried grapes and that which has been boiled are added before fermentation; that to which spirit has been added, after. There is no difference in the result between the sugar in the grape, and that of the cane. The wine sent you, was made from grapes suffered to hang on the vines two weeks later than usual. The grapes gathered two weeks earlier had a portion of sugar added. There was no perceptible difference in the wine. I have some wine made from grapes not fully matured, to which neither spirit nor sugar were added, that is now six years old. I shall, to a small part of the wine made this season, add as much spirit, as there is in the Boker Rhenish wines, and will send a sample of each, to have your opinion of the result. I shall next season ferment a portion of my must, with a view to the production of a wine resembling Champagne. I have confidence in its practicability.

I set down, merely to acknowledge my gratification with the contents of your letter: but when we mount our hobby, we know not where to stop. As I doubt not you have one of your own, you will know how to excuse me.

Very respectfully yours, N. LONGWORTH.

* For the New England Farmer.

TULIP MANIA.

MR. EDITOR, I have often seen it stated that there was a time when the tulip was sold for a great price in Holland; that the variety called the Viceroy, would sell for one thousand dollars, &c. but never saw so full an account of the remarkable tulip fever that raged in that country, as is contained in the following which I have taken the liberty to copy from an old magazine; thinking should you give it a place in your valuable paper, it would be amusing to many of your readers.

Yours, &c. A SUBSCRIBER.

In 1634 a violent passion for tulips appeared in Holland, and spread over the United Netherlands, where it acquired the dignified title of the tulip trade. It engaged the attention of all ranks for three full years. The farmer lost sight of his plough—the mechanic of his art—and the merchant of his trade, and strange! the lawyer forgot how to plead: in short the infection pervaded every order and condition of life. All were employed in the tulip trade, or in other words, the new business of raising and vending handsome tulips! Such was the frenzy of the time, that

The Viceroy would sell for £250 sterling, \$1,110
Admiral Pierkeens would often command
£440 - - - \$1,956
Admiral Van Eyk £160 - - - \$710
Grebbe was cheap at £148 - - - \$657
Schilder £160 - - - \$710
And Semper Augustus might now and
then be had as a bargain at £550 2,443
Such sums for such things would appear incredible to this age, if the fact was not too well established to admit of a doubt.

In 1637 a collection of tulips belonging to Wouter Brockholmenster, was sold by executors, for a sum equal to £9,000 or \$40,000.

A fine Spanish cabinet, valued at £1,000 and

£300 in cash, equal to \$5,777, was given for a Semper Augustus.

Three other Semper Augustuses brought a thousand pounds each; and the gentleman who sold them refused for his parterre £1,500 a year for seven years; every thing to be left as found in the parterre, only reserving to the lessee, during that term, the increase of these precious flowers—which was about \$6,666.

Another person cleared in the course of four months £6,000, or the enormous sum of \$26,670. All these sums are in sterling or good money. At length a check was put to this frenzy, by an order of State, invalidating all contracts made in the tulip trade; so that a root, which before would command £500 would not now bring five guineas.

It is said of a single city in Holland, that the trade in it in the course of the three years, was a million sterling or about \$4,444,443 all in tulips.

The childish folly of the grave and frugal mynheers, during this remarkable period, cannot be better illustrated than by a story which was often told and always believed to be true at the time.

"A Burgomaster having procured a place of great profit for his friend a native of Holland, declined some generous offer of recompense from the latter; he only requested to see his flower garden which was readily granted. Two years afterwards the same gentleman paid a visit to his benefactor, and walking in the burgomaster's garden, he recognised there a scarce tulip of great value which the disinterested magistrate had before clandestinely taken from the garden of the other. The promoted friend now became frantic with rage—threw up his place, which was worth a thousand a year—returned home—tore up his flower garden—and was never heard of more!"—*Ann. Reg.* 1765.

From the Maine Farmer.

ENGRAFTING AND SETTING OUT TREES IN THE SAME SEASON.

MR. HOLMES, In the 6th number of vol. ii, there is an editorial article headed as above, by which it appears you have put queries to a number of persons in regard to this mode of managing trees, without obtaining the information desired. It appears however, that you have obtained through the medium of the Northern Farmer, the knowledge of one instance of its success. Two witnesses are better than one, I will therefore give you my experience on the subject in the spring of 1830. I bought thirty trees of a sufficient size to set in an orchard. In digging up the thirty large ones, we dug up a considerable number of small crooked things that were not worth any thing to the owner; I therefore obtained about sixty from the nursery. They were of all sizes, from the bigness of a pipe-stem to that of a man's thumb. I carried them home and put them in the barn. The next day being rainy, I went to work and grafted them. As soon as it was fair weather, I had them set out in rows, each kind by itself. The result was that upwards of fifty grew and did well. The large ones were set out and I engrafted them, some the same day, and some a few days after, and they did as well as any scions that I ever set.

Let trees be properly set, and I would then graft them and warrant them as cheap as I would any trees whatever.

Z. SARGENT.

Gardiner, March 2, 1834.

From the Vermont Watchman.

WHAT TO DO WITH IT.

MR. EDITOR, Many persons ask, "what shall we do with it?" when we persuade them to abandon ardent spirit. I answer destroy your enemies with it. The house of an inn-keeper of my acquaintance was very much infested with vermin; he resorted to many different methods but could not destroy them; at length he thought of the effect ardent spirits had upon his two legged customers, and he resolved to make an experiment. Accordingly he prepared a pan of black-strap, set it in the cellar and waited the event. The next morning he found fourteen large rats lying helpless around the pan. It is needless to add, he pursued this device until his house was cleared of rats and mice.

A farmer's corn was much annoyed by a bear, which he was not able to destroy until he thought of rum. He procured a vessel of well sweetened rum, and the next morning bruin was too rich and happy to go or stand. A few have found that corn strongly saturated with rum, will take away the use of leg and wing from crows. One old farmer told me last summer that grasshoppers loved it too. Now I say; neither throw away nor burn ardent spirit, nor for conscience's sake murder human beings with it—but destroy grasshoppers, bears, and crows. Foxes I presume, are too cunning to drink it. A. B. N.

USEFUL HINTS FOR HOUSE SERVANTS.

SODA, by softening the water, saves a great deal of soap. It should be melted in a large jug of water, some of which pour into the tubs and boiler; and when the latter becomes weak, add more. The new improvement in soft soap is, if properly used, a saving of near half in quantity; and though sometimes dearer than the hard, reduces the price of washing considerably.

Many good laundresses advise soaking linen in warm water the night previous to washing, as facilitating the operation with less friction.

Soap should be cut with a wire or twine, in pieces that will make a long square when first brought in, and kept out of the air two or three weeks; for if it dry quick it will crack, and when wet break. Put it on a shelf, leaving a space between, and let it grow hard gradually. Thus it will save a full third in the consumption.—*H. S. Dict.*

WILD GEESSE

—In large flocks have passed over this town during the last week. The migrations in this direction are quite regular, this being one of the travelled highways they pursue in making their periodical journeys. On all their routes, wild geese have regular taverns or stopping places, to obtain rest and food. The great bend of the river below this town and also that above it, are among their favorite places of resort to woo "nature's sweet restorer." They come down upon the bosom of the waters and repose until morning, when they renew their journey to the northern or southern latitudes as the seasons direct. It is generally supposed in spring that wild geese are going to the great lakes to breed. At the lakes the people know but little of them. They stop there but a short time and continue their course onward and are found in vast numbers almost at the north pole.—*Northampton Courier.*

SCIENCE OF AGRICULTURE.

IMPROVING THE BREEDS OF ANIMALS.

By improving a breed, is understood to be the producing such an alteration in shape or description, as shall render the animal better fitted for the labors he has to perform; better fitted for becoming fat; or for producing milk, wool, eggs, feathers, or particular qualities of these. The fundamental principle of this amelioration is the proper selection of parents. Two theories have obtained notice on this subject, the one in favor of breeding from individuals of the same parentage, called the *in-and-in* system, and the other in favor of breeding from individuals of two different offsprings, called the system of *cross-breeding*.

That the breed of animals is improved by the largest males, is a very general opinion; but this opinion is the reverse of the truth, and has done considerable mischief. The object of breeding, by whatever mode, is the improvement of form, and experience has proved, that crossing has only improved, in an eminent degree in those instances in which the females were larger than in the usual proportion of females to males, and that it has generally failed where the males were disproportionately large. (*Cully's introduction, &c.*) The following epitome of the science of breeding, is by the late eminent surgeon, HENRY CLINE, who practised it extensively on his own farm at Southgate.

The lungs are of the first importance. It is on their size and soundness that the strength and health of animals principally depends. The power of converting food into nourishment is in proportion to their size. An animal of large lungs is capable of converting a given quantity of food into more nourishment than one with smaller lungs; and therefore has a greater aptitude to fatten.

The chest, according to its external form and size, indicates the size of the lungs. The form of the chest should approach to the figure of a cone, having its apex situated between the shoulders, and its base towards the loins. Its capacity depends on its form more than on the extent of its circumference; for where the chest is equal in two animals, one may have much larger lungs than the other. A circle contains more than an ellipsis of equal circumference; and in proportion as the ellipsis deviates from the circle it contains less. A deep chest, therefore, is not capacious, unless it is proportionally round.

The pelvis is the cavity formed by the junction of the haunch bones with the bone of the rump. It is essential that the cavity should be large in the female, that she may be enabled to bring forth her young with less difficulty. Where the cavity is small the life of the mother and her offspring is endangered. The size of the pelvis is chiefly indicated by the width of the hips, and the breadth of the waist, which is the space between the thighs. The breadth of the loins is always proportioned to that of the chest and pelvis.

The head should be small, by which the birth is facilitated. Its smallness affords other advantages, and generally indicates that the animal is of a good breed. Horns are useless to domestic animals, and they are often a cause of accidents. It is not difficult to breed animals without horns. The breeders of horned cattle and horned sheep, sustain a loss more sensible than they conceive; for it is not the horns alone, but also much bone in the skulls of such animals to support the horns, for which the butcher pays nothing; and besides this there is an additional quantity of ligament and

muscle in the neck, which is of small value. The skull of a ram with horns, weighed five times more than a skull which was hornless. Both these skulls were taken from sheep of the same age, each being four years old. The great difference in weight depended chiefly on the horns, for the lower jaws were nearly equal; one weighing seven ounces, and the other six ounces and three quarters, which proves that the natural size of the head was the same in both, independent of the horns and the thickness of the bones which supports them. In horned animals the skull is extremely thick. In a hornless animal it is much thinner, especially in that part where the horns usually grow. To those who have not reflected on the subject it may appear of little consequence whether sheep and cattle have horns, but on a moderate calculation it will be found that the loss in farming stock, and also in the diminution of animal food, is very considerable, from the production of horns and their appendages. A mode of breeding which should prevent the production of these, would afford a considerable profit in an increase of meat, wool, and other valuable parts.

The length of the neck should be proportioned to the height of the animal, that it may collect its food with ease.

The muscles, and the tendons, which are their appendages, should be large; by which an animal is enabled to travel with greater facility.

The bones, when large, are commonly considered an indication of strength; but strength does not depend on the size of the bones, but on that of the muscles. Many animals with large bones are weak, their muscles being small. Animals that have been imperfectly nourished during their growth, have their bones disproportionately large. If such deficiency of nourishment originated from a constitutional defect, which is the most frequent cause, they remain weak during life. Large bones, therefore, generally indicate an imperfection in the organs of nutrition.

To obtain the most improved form, the two modes of breeding described as the *in-and-in* and crossing modes, have been practised. The first mode may be the better practice, when a particular variety approaches perfection in form; especially with those who may be acquainted with the principles on which improvement depends. When the male is much larger than the female, the offspring is generally of an imperfect form. If the female be proportionably larger than the male, the offspring is of an improved form. For instance, if a well formed large ram be put to ewes proportionately smaller, the lambs will not be so well shaped as their parents; but if a small ram be put to large ewes, the lambs will be of an improved form. The proper method of improving the form of animals consists in selecting a well formed female proportionately larger than the male. The improvement depends on this principle, that the power of the female to supply the offspring with nourishment, is in proportion to her size, and to the power of nourishing herself from the excellence of her constitution. The size of the fetus of a smaller male than herself, the growth must be proportionately greater. The larger female has also a larger quantity of milk, and her offspring is more abundantly supplied with nourishment after birth.

Abundant nourishment is necessary to produce the most perfect formed animal, from the earliest period of its existence until its growth is complete. As already observed, the power to prepare the

greatest quantity of nourishment from a given quantity of food, depends principally on the magnitude of the lungs, to which the organs of digestion are subservient. To obtain animals with large lungs, crossing is the most expeditious method; because well formed females may be selected from a large size, to be put to a well formed male of a variety; that is, rather smaller.

By such a mode of crossing, the lungs and heart become proportionately larger, in consequence of a peculiarity in the circulation of the foetus, which causes a larger proportion of the blood under such circumstances, to be distributed to the lungs, than to the other parts of the body: and as the shape and size of the chest depend upon that of the lungs, hence arises that remarkably large chest which is produced by crossing with females that are larger than males. The practice according to this principle of improvement, however, ought to be limited, for it may be carried to such an extent that the bulk of the body might be so disproportioned to the size of the limbs as to prevent the animal from moving with sufficient facility. In animals where activity is required, this practice should not be extended so far as in those which are intended for the food of man.

The character of animals, or the external appearances by which the varieties of the same species, are distinguished, are observed in the offspring; but those of the male parent more frequently predominate. Thus in the breeding of horned animals, there are many varieties of sheep and some of cattle which are hornless. If a hornless ram be put to a horned ewe, almost all the lambs will be hornless; partaking of the male more than of the female parent. An offspring without horns or rarely producing horns, might be obtained from the Devonshire cattle, by crossing with bulls of the Galloway breed; which would often improve the form of the chest, in which the Devonshire cattle are often deficient.

Examples of the good effects of crossing may be found in the improved breed of horses and swine in England. The great improvement in the breed of horses arose from the crossing with the diminutive stallions, Barbs, and Arabians; and the introduction of Flanders mares into the country, was the source of improvement in the breed of cart horses. The form of swine has been greatly improved, by crossing with the small Chinese boar.

Examples of the bad effects of crossing a breed are more numerous. When it became the fashion in London, to drive large bay horses, the farmers in Yorkshire put their stallions to much larger mares than usual, and thus did infinite mischief to their breed by producing a race of small chested, long legged, large boned, worthless animals. A similar project was adopted in Normandy, to enlarge the breed of horses there, by the use of stallions from Holstein; and in consequence the best breed of horses in France would have been spoiled, had not the farmers discovered their mistake in time, by observing the offspring much inferior in form to that of their native stallions. Some graziers in the isle of Sheppy, conceived that they could improve their sheep by large Lincolnshire rams; the produce of which, however, were much inferior in the shape of the carcass, and the quality of the wool; and the flocks were greatly impaired by this attempt to improve them. Attempts to improve the animals of a country by any plan of crossing, should be made with the greatest caution; for by a mistaken practice extensively pursued, irrepara-

ble mischiefs may be done. In any country where a particular race of animals has continued for centuries, it may be presumed that their constitution is adapted to the food and climate.

It may be proper to improve the form of a native race, but at the same time it may be very injudicious to attempt to enlarge their size; for the size of animals is commonly adapted to the soil and climate which they inhabit. Where produce is nutritive and abundant, the animals are large, having grown proportionately to the quantity of food which for generations they have been accustomed to obtain. Where the produce is scanty, the animals are small, being proportioned to the quantity of food which they are able to procure. Of these contrasts, the sheep of Lincolnshire and of Wales are samples. The sheep of Lincolnshire would starve on the mountains of Wales.

Crossing the breeds of animals may be attended with bad effects in various ways; and that even when adopted in the beginning on a good principle; for instance, suppose some larger ewes than those of the native breed, were taken to the mountains of Wales, and put to the rams of that country; if these foreign ewes were fed in proportion to the size, their lambs would be of an improved form and larger in size than the native animals; but the males produced by this cross though of a good form, would be disproportionate in size to the native ewes; and therefore if permitted to mix with them, would be productive of a starveling, ill-formed progeny. Thus a cross which at first was an improvement, would, by giving occasion to a contrary cross, ultimately prejudice the breed. The general mistake in crossing has arisen from an attempt to increase the size of a native race of animals; being a fruitless effort to encounter the laws of nature.

From theory, from practice, and from extensive observation, the last more to be depended on than either, "it is reasonable," Cline continues, "to form this conclusion: it is wrong to enlarge a native breed of animals, for in proportion to their increase of size, they become worse in form, less hardy, and more liable to disease."—*Communications to the B. of Ag. Vol. 4, p. 448.*

BARKING TREES.

It often happens that fruit trees, more particularly apple and pear trees, are stripped of their bark during the winter by sheep, rabbits, or mice. When such accidents do happen, such trees should not be looked upon as lost, but as soon as the sap begins to circulate freely in the spring, they should be repaired, by fitting in pieces on every side to keep up the circulation between the top and the roots.

The following directions will enable those who shall be so unfortunate as to have their trees injured by mice, or otherwise, to repair them without incurring any great expense.

Where the bark has been taken from the bottom of a tree, as soon as it is discovered, it should be covered up to prevent the wood from becoming dry. During the month of May uncover the wood, and with a chisel or some other instrument cut off from the tree so much wood as will leave a flat surface, equal in width to the piece to be inserted. Let this extend so far up and down as to reach the sound bark, and make the cut square in at the ends. Procure a piece of wood from a growing tree of the same kind, whether ap-

ple or pear, cut it of a suitable length, split off a piece from one side of it, cut the ends smooth with a knife, being careful not to bruise the bark, fit it closely into the place prepared in the side of the tree, having the greatest proportion of the sap flow, or line between the bark and wood, that can be, come in contact. Proceed in the same way on different sides of the tree, after which bind the whole part with some bark or strings made from flax, and cover the whole with earth, if it does not extend too far up the tree. If the bark was removed too far up, to be convenient for covering with earth; take some strips of cotton cloth, dip them in melted grafting wax, and wind them on in such a manner as to make the whole air tight. If well done the pieces will unite at both ends, and soon extend so as to cover the wound.—*Goodsell's Farmer.*

From Silliman's Journal of Science.

DWELLING HOUSES.

Of the thousands and tens of thousands who every year engage in the erection of dwellings, how few possess, or are in condition to obtain, the knowledge which is needful to guide their judgments in respect to the most essential of the above particulars, or with a view either to economy, convenience, durability, elegance, health, security from fire, effect on price, or any other advantage, private or public.

The public mind is not impressed with the considerations which ought to be had in view in the location of habitations; and in numberless cases individuals blindly follow bad examples, or are determined by some whim, or some circumstance foreign to the real and permanent benefits, to secure which ought to be their object. Each one, especially in the country and new settlements, builds his house when, how and where he pleases, as though his successors and the public had no concern with the matter, and as though the erection of a shelter for his family in a position and by a process which should least interfere with his present convenience and employments, were all that behooved him to take into the account.

Hence it is common to observe houses placed where they should not be, though in the immediate vicinity of eligible sites, while the barns and out buildings are so near to them and to each other, as to be objectionable on many accounts, besides being all liable to be destroyed by fire in case of the burning of either of them.

Houses are likewise frequently built in low and damp situations, where draining is impracticable, while the barns pertaining to them are placed where the dwellings should be, on dry and advantageous locations. In numerous instances likewise, houses are to be observed not only on the borders of ponds and marshes, but on the side of them which is opposite to that whence prevailing wind proceeds.

This subject involves the physical nature, circumstances and wants of man, and in no slight degree his welfare as a rational, social and accountable being; it has an important relation to his plans, employments and success in life, and indeed to his whole history; it is to be studied in all its relations to nature and art, its relations to what is uniform and unalterable in the earth, to the various changes which are taking place on the surface, to various local peculiarities, to the increase and decay of vegetable matter, and the ne-

glect or progress of cultivation, to the changes in the course and deposits of streams, to the condition of natural and artificial collections of water, to climate and to the long catalogue of local, periodical and epidemic diseases.

A general reformation of the opinions and tastes of mankind, in respect to this whole subject, is greatly to be desired as a means of temporal happiness. No small proportion of the self procured and the hereditary misery and degeneracy of the race proceeds from ignorance and neglect of what is every where practicable in relation to this subject.

Who that closely inspects the sites, plans, materials and condition, of all habitations in any district of country, or in any town or city, and the character, habits, pecuniary circumstances, pursuits, recreations and enjoyments, of their respective occupants, but must be forcibly struck with the powerful and discriminating effects of the causes which are involved in this field of inquiry?

There is then every encouragement of growing and ultimate success to cheer those whose part it is to promote this object. And there surely are not wanting those in every place, who by their education and circumstances are qualified to take a part in it, and who by a common effort may do much for its advancement.

APPLES.

We are informed that the farmers in many towns laid up last fall great quantities of apples, which they are feeding out to their cattle instead of potatoes. Some farmers in Middle Granville, have three or four hundred bushels of apples in their cellars. A farmer in Blandford says cows fed with apples in the autumn will give milk as abundantly as in June, and that he cannot perceive any difference in the beneficial effects of sour and sweet apples. Another in East Granville, says he can make as good pork and beef with apples as potatoes—It is the opinion of many that a bushel of the former nearly equals in value a bushel of the latter. Such facts we think are of great value to the farmer; if he can convert his apples into beef and pork, or by them increase the products of the dairy, then a way is opened for the conversion of fruits into money without going through with the longer and more tedious process of converting them into cider, and that into brandy, and that into money. Again if pork, beef, butter and cheese can be made from apples, they will yield a great profit to the farmer than if he make these articles by the aid of potatoes or grain since they cost but little.—*Westfield Journal.*

PREMIUMS ON CIDER

—WERE awarded last week by the Committee of the Agricultural Society, to Col. Elisha Edwards of Southampton, \$4. Hiram Clark of Southampton, \$3. Pearson Hendrick of Easthampton, \$2. Daniel Newhall of Conway, \$1 00. The first premium on Spring Wheat was awarded to Mr. Asahel Thayer of Heath, Franklin County. The quantity was 34 bushels and eight quarts, raised on one acre and fifteen rods, weighing 62 pounds per bushel. The actual expense of cultivating it was, \$11 50. The petition of sundry inhabitants of West Springfield, relative to holding the next Cattle Fair in that town, was deferred to the next meeting on the first of April.—*Northampton Courier.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, APRIL 2, 1834.

MESSRS. WINSHIPS' GREEN HOUSE AT BRIGHTON.

We have recently taken a trip to Brighton for the purpose of making a visit to the Horticultural Establishment of Messrs. Winships, and were much gratified. We were particularly pleased with the green-house, in which there is a very great collection of rare, beautiful and useful plants, both exotics and natives. These are supplied with an artificial temperature, both by fire flues and hot water pipes. The number of plants in pots is upwards of four thousand, which appear to luxuriate in the mingled climates of the torrid and temperate zones; and though many of them strangers to our land and latitude, they seem perfectly at home in their domiciles, where art supplies all the requisites, to their perfection, which nature cannot afford to the "pale unripened florets of the north."

The marble walls, porcelain tiles, Chinese ornaments and other samples of oriental magnificence made us imagine we were within the influence of the wand of some enchantress, who had "wrapped us in elysium," and substituted the delights of paradise for the insipid realities of common existence.

The Boston and Worcester Rail Road will pass within a short distance of this Temple of Flora, and if it does not become a fashionable resort in the vernal and summer months, we shall say that the beau monde of Boston ought never to be indulged with prospects fairer than views of brick walls, paved streets, and narrow thread-needle lanes, where day-light can scarcely penetrate, and the inhabitants are doomed to a crowded seclusion, suffering all the penalties of confinement, without the pleasures of solitude.

We understand that the Green House of Messrs. Winships is an indication of the taste and liberality of a generous and benevolent friend who chose that method of evincing his good wishes to its proprietors.

For the New England Farmer.

KEEPING STACKS CLEAR OF RATS AND MICE.

MR. EDITOR, In vol. x, No. 52, page 412, of the New England Farmer, is an article under the above head. A subscriber wishes to inquire whether the receipt there mentioned will answer the same purpose in a mow or bay in a barn; and more particularly whether it will injure the straw for cattle. The nitre, I think would not, but do not know what effect the alum might have or both combined. I am in the practice of sprinkling a small quantity of salt on my grain, when I mow it away, instead of brining the straw after threshing. Would the salt alter the effect?

By the Editor. The recipe alluded to by our subscriber was taken from the *Farmer's Magazine*, published in Scotland. It directs "to take one pound of saltpetre and one pound of alum, dissolve them together in two pints of spring or well water; get a firlo [some what more than a bushel] of bran, and make a mash thereof, putting in two pints of the above liquid, and mix them all together. When you build your stack, every second course take a handful or two of said mash, and throw upon them."

We do not pretend in general to vouch for the efficacy of the recipes we publish; but give them as we find them or receive them, either orally, in

print, or in writing. If we should publish nothing relative to improvements or progress in agriculture or other arts, which had not been tested by our own personal experience, our pages would soon be as destitute of novelty as of utility. We pass such currency as we receive, unless we know or suspect it to be counterfeit, in which case we nail it to the counter; we generally do and always ought to indicate the sources from which we derive our recipes, directions, suggestions, &c.; and having given our authorities, we leave our readers to judge for themselves what degree of credit is due to them.

With regard to the materials in the above compound, both the alum and the nitre are used in medicine, and we believe would not prove injurious to cattle in such quantities as the animals could well be induced to swallow them. But with regard to their rendering stacks of hay or straw unpalatable to cattle, or making rats or mice keep their distance, all we know is that it is so stated in the Scotch Magazine from which we extracted the receipt referred to above.

For the New-England Farmer.

THE BLACK OR COMMON ELDER.

The virtues of the Elder are but little known among us. In continental Europe it is used with success in many diseases. From Hippocrates down to the present time, we are told by the French Society of Naturalists, the Elder has been employed in medicine. Every one knows, say they, its virtues and properties; they are not equivocal, for time and experience have confirmed them.

Its flowers are resolute, anodyne and emollient. Infused and drank like tea they provoke and establish perspiration in certain fevers, colds and catarrhs. Fried with eggs, they operate as a purge; applied as a fomentation in the Erysipelas, they reduce the heat and irritation, and are excellent in all inflammations of the skin; warmed and applied to the forehead and temples, they cure the Megrims. They are used in the vapor bath for swollen legs, particularly in the Dropsy, in which disease the berries, inner bark and roots of this plant are used with effect as diuretics and purgatives. From the berries a Rob or thick syrup is made, which is given with success in bowel complaints, particularly in the Dysentery.

Its flowers give a fine perfume to vinegar, and to wine the flavor of Muscat. Apples when laid on a bed of the flowers of the Elder when dried, and then confined from the air, acquire an exquisite taste. A decoction of its berries dyes linen, after passing it through alum water, of a greenish brown color, and from them good brandy can be distilled.

An English farmer, in the county of Devonshire, at a season when the whole of vegetation was destroyed by caterpillars, grasshoppers and other insects, observed that the Elder remained untouched in full health and vigor. This induced him to make an experiment which was attended with perfect success. With boughs of the Elder he went over his fields whipping and rubbing gently his turnips, cabbage plants, wheat, &c. which drove off all those noxious insects, and they never returned to their destructive work: The strong stinking scent of the plant destroyed the eggs of these insects. Since that time the process has been used with success on fruit trees and all other plants when attacked by insects. Some boil the branches, leaves, &c. of the Elder in water,

and then sprinkle it over those plants and trees attacked by insects, which has the desired effect.

This shrub flowers in June; after picking the flowers and berries they should be dried in the sun, and then laid up in a clean place free from moisture, for medicinal purposes.

There are varieties of the common Elder; some plants have deeply indented leaves. The leaves of some are streaked with yellow, others with white, and some with yellow and white. Some bear white and others green berries. The Elder is multiplied by seeds, layers and slips. They take root rapidly when planted in slips, as do most plants having much pith.

Hedges of Elder are common in some parts of Europe. They are impenetrable, of long duration, and not subject to the depredations of cattle from their odor being very offensive to them. Sheep will sometimes eat them.

The wood of roots of the Elder is used in Germany and France in making toys, sword canes, snuff boxes, fishing rods, combs and other articles, and by cabinet-makers and turners.

WM. LEE.

For the New England Farmer.

REMARKABLE OAT PLANT.

MR. FESSENDEN, I send you the stalks produced from one oat; there are 140 stalks, and from 1 stalk at the time of reaping, 330 oats grew. The height of the oats was 5 feet 2 inches. This was raised on new land, in Township No. Four, in Oxford county, state of Maine, last season. E. ADAMS.

The roots and clusters of the lower part of the stalks of the above-mentioned vegetable phenomenon may be seen at the office of the N. E. Farmer.

Editor.

ET CETERAS.

A NEW Agricultural paper entitled "*The Cultivator*" has been recently issued in Albany. It is to be published monthly, under the sanction of the New York Agricultural Society, to be edited by a committee of which Judge Buel, President of the Society, is Chairman. The price of this paper will be but 50 cents per annum, and it will no doubt be conducted with much ability, and obtain an extensive circulation. We wish it success, and believe it will add strength and stability to the cause on which all are dependent, and in which every person of reflection will feel a direct and powerful interest.

A pretty pithy paramount piece of poetry, and notice of a present proper for a prince or a peasant, shall blaze in the poet's department of our next paper.

ITEMS OF INTELLIGENCE.

Salt.—The people of Onondaga County, N. Y. believe they have under them an inexhaustible mass of rock salt, and that in raising this, instead of brine, they shall save half the expense of manufacturing, and be able to supply the Atlantic towns with salt cheaper than they can import it. There is one difficulty which now threatens, and that is the expense of fuel. The wood now used at the different salt springs now in operation, amounts to 400 cords a day, and as the works are in use 200 days in a year, the annual consumption is 80,000 cords.

A Cincinnati paper of the 4th instant, states that the steamboat *Banner* collapsed her flue, on the 23d ult. 27 miles below St. Louis. The engineer was badly scalded—the chamber-maid has not been heard of since, and it is believed that she jumped overboard and was drowned.

In Kilkenny, a few days since, a gentleman named Madden, was administering medicine to a glandered horse, when some of the purulent matter of the animal was absorbed in a cut which he had on one of his fingers, and spreading rapidly through the system, soon brought on death.

Metallic Currency.—It appears from a memorial addressed to the N. Y. Legislature, by the N. Y. Committee of Safety, on the distress of the community, that the whole amount of the gold and silver in the United States, at this present time, is about \$26,000,000,—which, if distributed among a population of 13,000,000, would give to each person *two dollars*!

This simple statement shows the impossibility of establishing an exclusively metallic currency, more clearly and forcibly than volumes of argument.—*Boston Mercantile Journal.*

A gold mine, recently discovered in Buckingham county, Virginia, is said to excel in richness any previously known in this country. The owner, in one day, with six or seven hands, raised upwards of two thousand dollars worth of ore. The mine is about eight miles south-east of Buckingham Court House.

A few days since certain eminent manufacturers of figures in St. Paul's Church-yard, shipped off for India and the Ganges no less than five hundred newly manufactured idols or false gods for sale. The profits from this pious fraud are expected to make the Christian merchants happy for the remainder of their days! Two missionaries go out in the same ship! Thus the natives of India will at once receive their "bane and antidote."—*Albion.*

QUARTERLY REVIEW, NO. C. FOR JANUARY.

CONTENTS.—Guzot's Edition of Gibbon. Bubbles from the Brunneus of Nassau; German Watering-Places. Poor-Law Question. M. G. Lewis's West India Journals. Blair on Slavery amongst the Romans. Trevelyan. Free Trade to China. Life of Crabbe, by his Son. Liturgical Reform. Note on a Pamphlet entitled 'A Refutation of Calumnies against the Lord Chancellor in last No. Quarterly Review.'

This day published by LILLY, WAIT & CO. ap 2

FORMAN WHEAT.

A FEW bushels of the above superior Spring Wheat for sale at this Office. It was raised by John Prince, Esq. at Jamaica Plain, from seed sent him by Gen. T. M. Forman, on the Eastern Shore of Maryland, having been originally selected from a single head in his field, and found for several years superior to any he had before cultivated. It is the same as mentioned by Mr. Parsons, N. E. Farmer, page 256, of 12th February 1834, and mentioned therein by mistake as being from Halifax, N. S.

WILLIAM MANN,

Having removed from Augusta to Bangor, will be happy to furnish his former customers (and all others who may want) with Forest Trees of almost every variety indigenous to the Penobscot country, and being very advantageously situated, he flatters himself that he can give perfect satisfaction, as no pains will be spared on his part to have the best trees selected and properly packed.

Orders may be left with Mr. Geo. C. Barrett, where catalogues and prices may be seen; or, if more convenient, they may be sent direct per mail. m 19

PRIZE DAHLIAS.

FOR SALE, 290 varieties of the best double Dahlias. This collection of Dahlias obtained the premium awarded by the Mass. Hort. Society the two last years.

Orders left with Messrs. HOVEY & CO No. 79 & 81 Cornhill, Boston, or C. F. PUTNAM, Salem, will be duly attended to. ap 2

MEXICAN TIGER FLOWER.

(*Ferraria Tigrida*.)

The root of this flower should be planted in April or early in May, in a light sandy soil, in a warm situation: it will also do well in a pot, and flowers in July. It often happens that the same root bears several flowers in succession. It is scentless, but very beautiful. In November cut off the stalk, take up the root, dry it well for a few days, and put it away in the cellar, in dry sand, till the spring. If there are any offsets, take them off, and plant them separately from the mother root.

Just received and for sale by GEO. C. BARRETT, m 26 New England Seed Store.

ASSIGNEES' SALE, AT PUBLIC AUCTION.

On WEDNESDAY, the 9th of April inst. at 9 A. M. on the Farm of Aaron Capen, in Dorchester, near the Cotton Factory—

Will be sold 6 Milch Cows, with some other stock and farm produce, and a variety of other articles. Also, about 20,000 faggots, 30 cords of hard wood, and some thousands of red cedar posts of various sizes, and the best quality; a very large proportion of them suitable for vine trellises. The wood and posts are cut and lying on the ground. ap 2 EBENEZER EATON, Auct.

MACHINE FOR CUTTING FODDER.

THE simplicity of the construction of this Machine, and the small probability of its getting out of repair, together with the neat and rapid manner that it performs its work, certainly renders it a desirable article for the purposes for which it is intended. It is constructed on an entire new principle from any heretofore invented, and will cut an hundred weight of hay in ten minutes, two inches long, can also cut any length from three inches to one-fourth of an inch; it is fed by placing the fodder in a hopper that stands perpendicular, the knife playing horizontally underneath, by which means all the complicated machinery for feeding and the power necessary to drive it is avoided.

The Subscriber having become the proprietor of the right of making, &c. said machine, in and for the State of Massachusetts, solicits the public to call and examine for themselves. Said Machine is for sale at the store of PROUTY & MEARS, No. 12 Commercial street, Boston. DAVID P. KING, Who is also Agent for the States of Vermont, New Hampshire, Maine, and Rhode Island. a 2. eow6w

SPRING RYE.

JUST received a quantity of Spring Rye, at New England Seed Store.

FLORIST'S MANUAL.

JUST received and for sale by GEO. C. BARRETT, at the New England Seed Store, The Florist's Manual, or a description of the Plants usually cultivated in the Flower Garden, with their habits and mode of cultivation. Price 40 cents.

THIS IS TO GIVE NOTICE

THAT the Season has arrived for Transplanting FRUIT and ORNAMENTAL TREES, VINES, &c. Those wanting an excellent collection will please call at the New England Farmer Office, and leave their orders, which at one day's notice will be attended to.

GARDEN, FLOWER, and GRASS SEEDS, the best collection ever offered in this market, and orders promptly attended to. GEO. C. BARRETT.

PAINT OIL.

The subscribers keep on hand a constant supply of their "Prepared Paint Oil," which is offered for sale with renewed assurances of its merit. This Oil, independent of being 25 per cent. cheaper in price, will actually cover a quarter more surface, as has been repeatedly proved and confirmed by statements of many Painters. Upwards of 200 buildings in this city and vicinity can be re-colored to, many of them painted two years ago, which continue to look well, and retained their gloss through the first year, which is a clear demonstration of its strength. The Prepared Paint Oil is found to answer a valuable purpose to mix with Linseed Oil, giving it strength and durability with a more permanent gloss. It paints a very clear white, flows smooth, and is more free from milldew, and changes resulting from the sea air, than any other Oil.

Oil Factory (head Foster's Wharf.)

DOWNER & AUSTIN.

P. S. Please be particular to order Downer & Austin's "Prepared Paint Oil." m 19 6pis.

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

1 Case wet (but not damaged) Bishops Lawn.

1 do. do. do. Book Muslin.

Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation.

March 14, 1834.

BRIGHTON MARKET.—MONDAY, March 31st, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day 480 beef cattle, 60 unsold; 16 pair of Working Oxen, 10 Cows and Calves; 266 Sheep and 1100 Swine.

PRICES. Beef Cattle—Sales were not so good as last week. We noticed one pair taken at \$6, and a few at 5 75; we quote prime at 5 17 a 5 62; good at 4 88 a 5 17; thin at 4 a 4 75; those at \$4 were very small and thin.

Working Oxen—Sales were effected at \$60, 62, 75, 78 and 88.

Cows and Calves—Sales were noticed at \$20, 23, 25 and 30. Sheep—We noticed sales at \$2 75, 3 25, 3 75, and 4 50.

Swine—Of the above number 400 came in on Saturday, and 300 did not arrive until the close of the market. One lot large selected barrows were taken at 6 1-4, and one of the sows at 5 1-4; several lots not selected and small were taken at 53-8 for sows, and 63-8 for barrows; at retail 6c for sows, and 7c for barrows.

GOOSEBERRY BUSHES.

25 Varieties fine imported Gooseberry bushes, just received from Scotland. GEO. C. BARRETT. m 26.

MISCELLANY.

From the Collegian.

THE HEIGHT OF THE RIDICULOUS.

I wrote some lines once on a time
In wondrous merry mood,
And thought, as usual men would say
They were exceeding good.

They were so queer, so very queer,
I laughed as I would die,
Albeit in the general way
A sober man am I.

I called my servant and he came—
How kind it was of him
To mind a little man like me,
He of the mighty limb!

"These to the printer," I exclaimed;
And in my humorous way
I added—for I love a joke—
"There 'll be the devil to pay."

He laughed—your footmen always laugh
When masters make a pun;
And well he might—I've tried enough,
And never made but one.

He took the paper and I watched
And saw him peep within;
At the first line he read, his face
Was all upon a grin.

He read the next, the grin grew broad
And shot from ear to ear;
He read the third, a chuckling noise
I now began to hear.

The fourth—he broke into a roar,
The fifth—his waistband split;
The sixth—he burst five buttons off
And tumbled in a fit.

Ten days and nights with sleepless eye
I watched that wretched man,
And since I never dared to write
As funny as I can.

THE MIRROR AND THE WINDOW PANE.

A MIRROR and a window pane were once desperately enamoured of a beautiful young girl, who had been brought up without ever seeing herself either in the glassy surface of the stream, or the polished looking glass. They agreed to refer their claims to her decision. The innocent damsel first looked through the pane of glass on one of the most lovely prospects of nature. Rich meadows, spotted with sheep and cattle, copses of wood whose fleecy foliage as it waved to and fro in the sweet south breeze, presented endless varieties of sprightly green; little brooks stealing their way in a thousand devious meanderings through the grass and flowers; hills arising gently one above another in graceful lines of beauty, until they ended in a cloud cap mountain, whose soft azure tints blended harmoniously with the skies, all mingled together in nature's matchless harmony, presented a scene of enchanting beauty.

She gazed so long at this landscape, that the mirror began to imagine it was all over with it, and turned dim with envy. At last the damsel placed herself before it, and became riveted to the spot enamored of the angel she saw reflected there. She beheld in its pure bosom a figure graceful as the sportive kitten; eyes that sparkled like jewels; lips like twin cherries; cheeks showing the opening roses; teeth of pearl; and neck and bosom of snow. She stood motionless with admiration, and when called upon for a decision between the ri-

val glasses, blushed and was silent. But from that day it was observed, that the window pane was deserted for the mirror, and the former at length broke its heart in despair.

LUMINOUS PLANTS.

In the case of the rhizomorphæ there can be no mistake. These curious plants are found in subterranean cellars and mines, and illumine the darkness which surrounds them with their magic light. In some of the coal mines of Dresden they are singularly beautiful and brilliant. Mr. James Ryan once informed me that he was accidentally shut up in a mine, and the light of one of the rhizomorphæ was so brilliant that he could see distinctly to read a letter by it, as the rhizomorphæ prey on dead wood, they impart to it a phosphorescent light. The rhizomorphæ phosphorentia is found in the mines of Hesse, and yields light in the dark, but ceases to be phosphorescent in Hydrogen and some other gases: the rhizomorphæ subterranea and accidula have also been found to illumine the mine with their fairy light. Mr. Erdman thus describes the luminous appearance of the rhizomorphæ in one of the mines of Dresden, "I saw luminous plants here in wonderful beauty; the impression produced by the spectacle I shall never forget. It appeared on descending into the mine as if we were entering an enchanted castle. The abundance of these plants was so great, that the roof, the walls, and the pillars were entirely covered with them, and the beautiful light they cast about them almost dazzled the eye. The light they gave out is like a faint moonshine, so that two persons near to each other, could readily distinguish one another. The light appears to be most considerable when the temperature of the mines is comparatively high." That the light is electric seems most probable, when we consider that an electric discharge imparts phosphorescence to Canton's phosphorus, (calcined shells,) and that heat enhances the light.—*Murray's Physiology of Plants.*

PHYSICAL EDUCATION.

DR. DURKEE'S Lecture before the Portsmouth Lyceum last Tuesday evening, on this subject, was well attended considering the inclemency of the evening. His anatomical illustrations of the effect of tight lacing, and his exhibition of the structure of the spine and the means by which its curvature is frequently induced, we were much gratified to see displayed before so large an audience—to whom it was both useful and interesting.

After listening to the alarming fact that sixty thousand females are annually brought to a premature grave in our country by the use of the corset, while temperance claims only thirty thousand,—the fair part of the audience have begun to talk of an Anti-Corset Society. We hope the spirit will not subside—but that it will spread through our town, and State, and go hand in hand with the march of Temperance, throughout the country.

As the subject of Physical Education is one of great interest to every individual, we shall in some future paper advert again to it.—*Ports. Journal.*

DOG POWER.

JOHN FARLEY, of Danville, Vt. advertises a patent "Dog Churn." He says, that churning is performed by the labor of dogs; and that the machine may be applied to other uses, such as turning grind-

stone and washing clothes. Women may now introduce "dog power" into their kitchens and dairy rooms, and seat themselves in the parlor.

REDUCTION IN PRICES OF TREES, &c.

WM. PRINCE & SONS have determined in consequence of the pecuniary pressure, to reduce the prices of a great variety of Trees and Plants, where orders are sent for a considerable amount: and all persons who desire Fruit and Ornamental Trees; Flowering Shrubs and Plants; Greenhouse Trees and Plants; Splendid Dahlias; or Seeds—will on applying to them direct by mail, with a list of the articles wanted, be promptly furnished with a printed sheet explaining the reduced rates.—The Chinese Mulberry, or Morus multicaulis are now reduced to \$25 per 100, and \$44 per dozen.—Apple trees in great variety \$20 to \$45 per 100.—Pears \$37½ per 100, and extra large ditto 50 cents each; and 50,000 are two, three, and four years grafted.—Peaches \$20 and 25 per 100.—Large Orange Quinces \$30 per 100.—English and Spanish Filberts \$25 per 100.—Fine Red Raspberries \$6 per 100.—Large Red and Yellow Antwerp \$16 per 100.—Gooseberries, finest Lancashire varieties \$20 per 100; and Large Red White and Black English Currants \$16 per 100.—Isabella Grape, 3 years old vines \$25 per 100, and 2 years ditto \$20 per 100.—Catawba, Alexander, Winne, York Claret, York Madeira, and Suppermong, \$25 per 100.—Herbmont's Madeira, Troy and Elsingburgh, \$30 per 100.—Norton's Virginia Seedling \$35 per 100.—The collection of choice European Grapes is unrivalled.—Chinese Ailanthus, 4 feet high, \$44 per dozen and larger sizes in proportion.—A reduction is made on a great many kinds of Roses, Pæonies, Chrysanthemums, &c.—Double Dahlias of such fine assorted kinds as have been most increased, will be supplied at \$3, \$4, and \$6 per dozen, according to excellence, and selected by ourselves. The roots can be sent to any distance.—The new varieties of Flemish and English Pears having been introduced by us and greatly increased, the prices of the greater part have been reduced, and the trees are mostly of fine size and three years ingrafted.—The Ornamental Trees and Shrubs of most kinds are large and thrifty, and of double or treble the value of smaller ones, which is a most decided advantage, being a gain of several years in embellishment.

N. B. Having no Agent at Boston, the Commission of 10 per cent. usually allowed for Agency, will be credited to the purchasers, and be deducted from the amount of the bills rendered. The stock of Dahlias being so very large, they will be furnished on the most favorable terms possible.

Linnæan Botanic Garden and Nurseries,
Flushing, near New-York, Feb. 10, 1834.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 260 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnuts, Weeping Willows, Catalpas, Mountain Ash, Silver Fir, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutan and Papaveracea—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with Geo. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

GOOSEBERRIES.

A new importation of superior kinds, just received, of all colors, by
WM. KENRICK, Newton.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[?] No paper will be sent to a distance without payment being made in advance.

VOL. XII.

BOSTON, WEDNESDAY EVENING, APRIL 9, 1834.

NO. 39.

ADDRESS OF J. BUEL, PRESIDENT OF THE
N. Y. STATE AGRICULTURAL SOCIETY,
Delivered at the Annual Meeting, Feb. 12, 1834.

We have associated, gentlemen, to increase the pleasures and profits of rural labor—to enlarge the sphere of useful knowledge—and by concentrating our energies, to give to them greater effect in advancing the public good. In no country does the agricultural bear so great a proportion to the whole population as in this. In England one-third of the inhabitants only are employed in husbandry; in France two-thirds; in Italy a little more than three-fourths*—while in the United States the agricultural portion probably exceeds five-sixths. And in no country does the agricultural population exercise such a controlling political power, contribute so much to the wealth, or tend so strongly to give an impress to the character of a nation, as in the United States. Hence it may be truly said of us, that our agriculture is our nursing mother, which nurtures, and gives growth, and wealth, and character to our country. It may be regarded as the great wheel which moves all the machinery of society, and that whatever gives to this a new impulse or energy, communicates a corresponding impetus to the thousand minor wheels of interest which it propels and regulates. Knowing this, party, and confined to no sect, its benefits and blessings, like the dews of Heaven, fall upon all. Identified then, as agriculture is, with the interests of every department in society, it becomes, for profession, in particular, to endeavor to enlighten its labors, to remedy its defects, and to accelerate its improvement.

Of the multitude of objects which present themselves as worthy of our consideration, I can only embrace a few of the most prominent ones in the subject matter of this address. I shall particularly invite your attention to

The economy and application of manures;

The improvement of farm implements and machines;

The advantages of draining;

The defects which exist in the present mode of managing our hop and barley crops;

The division of labor;

The introduction of new articles of culture; and

To some illustration of the comparative profits of good and bad husbandry.

Manures.—If we consider that all animal and vegetable substances are susceptible of being converted into manure, or food for farm crops, and reflect upon the great quantity of these which are wasted upon a farm; and if we add to these considerations the fact, now well established by chemical experiment, that yard dung loses a large portion of its fertilizing properties, in the gases which escape, where fermentation is suffered to exhaust its powers upon it in a mass, we may be able to appreciate, in some measure, the great defects which exist in our general management of this all important material. Manures are a principal source of fertility. They are to our crops what hay and forage are to our cattle—the food which is to nourish and perfect their growth. Continual cropping, without manure, as certainly exhausts

land of its fertility, as constant draining from a cistern that is never replenished exhausts the water which it contains. The practice of some, who disregarding one of the soundest rules of farming, continue to crop without manuring, till the soil will no longer yield a return to pay for the labor, is upon a par with that of the man who undertook to teach his horse to live without food: just as the experiment was about to succeed, the horse died. A considerable portion of the lands in Virginia and Maryland, which was originally fertile, have in this way been injudiciously exhausted, and thrown into commons as not worth enclosing. I lately received a letter from a young gentleman in the former state, soliciting my advice as to the means best adapted to restore fertility to two worn out farms which had recently come into his possession, and which, he stated, would no longer produce clover. It is much easier to prevent sterility than to cure it, on the same principle that it is easier to keep a cow in flesh when she is so, than to restore her to flesh after she has become wretchedly lean. In some soils, to which nature has been uncommonly bountiful in imparting the means of fertility, as in many of our river alluvions, the deterioration is slow and imperceptible; yet it nevertheless goes on even there. But in ordinary, and particularly in the lighter soils, the profits of husbandry depend, in an eminent degree, upon the faithful application of all the manure which a farm can be made to produce.

In regard to the question, in what condition are manures most economically applied, I am sensible that a difference of opinion exists, many contending, even on philosophical grounds, that it is most wise to apply them after they have undergone fermentation. If the question was merely whether a load of fermented or unfermented dung is of the greatest intrinsic value, in ordinary cases the former would be entitled to the preference, because it contains the greatest quantity of vegetable food. But the correct way to state the question would be this: Will five loads of rotted manure impart greater fertility than ten loads that are unrotted? The numbers ought rather to be five and fifteen—for I think common dung suffers a diminution of two-thirds, instead of one-half, in volume, by a thorough process of rotting.* It will assist in determining the question if we ascertain what the manure parts with during fermentation, for it evidently loses much in weight as well as in bulk, and whether this lost matter would, if buried in the soil, have afforded food to the crop. For if it possessed no fertilizing property, the sooner it is got rid of the better, and we save the expense of transporting it to the field. But if it really consists of prepared or digested food, fitted for the organs and wants of plants, it is truly improvident to have it wasted and lost for all useful purposes. The latter is really the case.† The matter which escapes in fer-

mentation is vegetable matter in a gaseous form, fitted by natural process, like chyle in the animal stomach, to enter into and become a constituent in a new generation of plants. It is principally carbonic acid gas, the aliment of vegetables and the true staple of vegetable life. It has been vegetable matter, and will become vegetable matter again when brought into contact with the mouths or roots of plants. Without resorting to chemical proofs of authorities to prove this, I will suggest a mode by which the matter can be satisfactorily settled. Let any farmer, in the spring, before yard manure ferments, put twenty-five loads in a pile to rot, and take another twenty-five loads to the field where he intends to plant his corn, spread it upon one acre, plough it well under, harrow the ground, and plant his seed. Let him plant another acre of corn alongside this, without manure. As soon as the corn is harvested, carry on and spread the twenty-five loads of prepared or rotted manure left in the yard, or what remains of it, upon the acre not manured for corn, and sow both pieces to wheat. Unless my observation and practice have deceived me, he will find the result of the experiment to be this: the acre dressed with long manure will yield the most wheat, because the manure has been less exhausted in the process of summer rotting, and for the reason, that in cultivating the corn, it has become better incorporated with the soil—as it will, besides, have yielded some twenty or thirty more bushels of corn, in consequence of the gases upon which the crop here fed and thrived, but which, in the yard were dissipated by the winds and rain.

Plants, like animals, require different modifications of food. In general, the plants which afford large stocks or roots, as corn, potatoes, turnips and clover, thrive best from the gases which are given off from dung in the process of fermentation—while those exclusively cultivated for their seeds, as wheat, barley, &c. are often prejudiced by these volatile parts, which cause a rank growth of straw without improving the seed. Hence the first mentioned crops may be fed on long manure without lessening its value for the second class, provided they immediately follow, and hence unfermented manures are most economically applied to hoed crops.

Different rules should govern in the application of fermented and unfermented manures. The latter should be buried at the bottom of the furrow with the plough, the former only superficially with the harrow. The reasons are these—unfermented dung operates mechanically while undergoing fermentation, in rendering the recumbent soil porous and pervious to heat and air, the great agents of decomposition and nutrition, and the gaseous or volatile parts being specifically lighter than atmospheric air, ascend,* and supply the wants of the

Dung which has fermented so as to become a mere soft cohesive mass, has generally lost from one-third to one-half of its most useful constituent elements. It evidently should be applied as soon as fermentation begins, that it may exert its full action upon the plant, and lose none of its nutritive powers.—*Dary.*

* A friend made this experiment: He trenched a quarter of his garden, and deposited a layer of dry straw, three inches thick, one foot below the surface, as the only manure, and planted it with water-melons. The crop he said was the finest he ever grew. On examining the straw in autumn, he found it was completely rotted, and reduced to the condition of short

* During the violent fermentation which is necessary for reducing farm-yard manure to the state in which it is called *short muck*, not only a large quantity of fluid, but of gaseous matter, is lost; so much so that the dung is reduced one-half or two-thirds in weight, and the principal elastic matter disengaged is carbonic acid, with some ammonia; and both these, if retained by the moisture in the soil, as has been stated before, are capable of becoming a useful nourishment for plants.—*Dary.*

† As soon as dung begins to decompose, or rot, it throws off its volatile parts, which are the most valuable and most efficient.

* Babbage on the Economy of Machinery.

young roots. The next ploughing turns the residue of the dung to the surface, when it benefits on a different principle; for fermented manures consist of ponderable substances, which have a tendency only to descend.

Manures possess a high value in all good farming districts, where the natural fertility of the soil has been impaired by culture. In most of our large towns it is bought up at one to two dollars a cord, and transported 10 or 20 miles by land carriage, and much farther by water. So essential is it considered in Europe to profitable husbandry, that every material which imparts fertility is sedulously economised, and applied to the soil. Among other things, ship loads of bones are annually brought from the continent into Great Britain and ground for manure. Bone dust is in such high demand in Scotch husbandry, that its price has advanced to 3s. 6d. sterling per bushel.

We possess no certain data to ascertain the saving which may be introduced into this branch of farm economy; yet if we put down the number of farms in the State at one-tenth of our population, or 200,000, and estimate that an average increase of five loads upon each farm might annually be made, it will give us a total of one million loads, which, at the very moderate price of 25 cents, would amount to \$250,000 per annum.

Farm implements.—We must all have noticed the great improvements which a few years have made in the mechanic and manufacturing arts. Scarcely a process is managed as it was twenty years ago. Scarcely an old machine but has undergone improvements, or given place to a better model. Manufacturing operations have been simplified and abridged, and human labor has been reduced to a comparative cypher, by the substitution of machinery and the power of steam. The effect has been a great reduction in the price of manufactured commodities, and an increase in their consumption. We are assured that during the twelve years which elapsed between 1818 and 1830, Sheffield wares—hardware and cutlery—experienced an average reduction in price of sixty per cent. varying upon different articles from 40 to 85 per cent.* Cotton goods, books, and various other fabrics, have undergone a reduction no less remarkable within our time. These beneficial changes have resulted in a great measure from the aid which science has either itself imparted, or which it has elicited from mechanic skill—for a useful invention often awakens latent genius, and calls forth successful competition, even in the unlearned. No sooner is an improvement in the manufacturing arts announced, than it is adopted whenever it can be rendered beneficial—such is the facility of intercourse—such the desire—the necessity—there, of profiting from every discovery which benefits their art. The farmer is less able and less willing to keep pace with the march of intellect. He has few opportunities of becoming acquainted with the improvements of others, except by slow degrees; and he is so liable to be taken in by the catch-penny productions of the day, and is withal so distrustful of new experiments, that he will hardly venture to buy new implements and machines, nor to adopt new practices, however beneficial they might prove on trial.

muck. He was satisfied that his melons had been highly benefited by the straw while undergoing fermentation, and that had the straw rotted in the yard, the volatile portion of the manure would have been wholly lost.

* Babbage on the Economy of Machinery.

Mr. Coke tells us that his examples in farming, (and few men ever gave better,) only enlarged the circle of their influence about a mile in a year. Hence, as regards this branch of improvement, we have much to do ere we can overtake the spirit of the age, as exemplified in our sister arts.

Many of our farm implements have undergone improvement; yet there are others which have been either but partially introduced, or are hardly known, that are calculated to abridge labor and to increase the profits of the farm. There exists a great disparity in the quality of implements. In ploughs, for instance, there is a difference which eludes superficial observation, particularly in regard to the force required to propel them, that is worth regarding. I have seen this difference in what have been termed good ploughs, amount to nearly fifty per cent. or one-half. The perfection of our implements is intimately connected with a correct application of mechanical science, a branch of knowledge hitherto too little cultivated among us. Messrs. Many & Ward, the enterprising proprietors of an iron foundry in this city, have assured me that there are more than two hundred patterns of ploughs now in use in this State. Of this number some may be very good, but many must be comparatively bad. But what individual is able to decide upon their relative merits, or even to become acquainted with the different sorts? It would be rendering an important service to the State at large, and especially to the farming interests, if a competent board was appointed, comprising men of practical and scientific knowledge, to test thoroughly, by examination and perfectly satisfactory trial, not only the ploughs but the other implements of husbandry now in use, or which may be hereafter invented, and to publish the result of their examination, and certify their intrinsic and relative merits. Such board might meet once or twice in a year, and no inventor or vender who had confidence in the goodness of his machine would fail to repair to the place of trial. This would tend to call into action mechanical science and skill, in the confidence of receiving a just reward; the public would confide in the trial and opinions of the board; good implements would be extensively introduced and bad ones would be discarded. The expense of the examination would bear no proportion to the public benefit.

Draining.—Few expenditures in husbandry are calculated to make better returns than those made in draining, a branch of labor which has a very limited practice among us, and of which we have yet much to learn. Many of our best lands are permitted to remain in a comparative unproductive state, on account of the water which reposes on the surface or saturates the sub-soil. To render these lands productive even for arable purposes, it is only necessary, by well constructed and sufficient drains, to collect and carry off the surplus water which falls upon the surface or rises from springs below. The rationale of draining is briefly this: Air and heat are essential agents in preparing the food of plants which is deposited in the soil, and they are also necessary for the healthful development of most of the cultivated varieties. These agents are in a measure excluded from the soil by the water. The temperature of a soil habitually saturated with spring water from beneath the surface, seldom exceeds 55 or 60 degrees at midsummer. Hence the grains and grasses, which require a heat of 80 or 90 degrees to bring them to a high state of excellence, can never thrive in the

these cold situations, where they find neither warmth nor the food suited to their habits. But drain these soils and they become light and porous, pervious to solar and atmospheric influence, the process of vegetable decomposition is accelerated, and a high state of fertility is developed.

One of the modern improvements in draining, which tends very much to give permanency to the work, is to dig the trench with a spade adapted to the purpose, with a wedge shaped bottom, say three inches at the bottom and five inches at the upper surface of the lower cut, and to fill this part with broken stone. The trench is dug two feet deep before this cut is made, and the wedge shaped bottom cleaned with a scraper fitted for the purpose. By concentrating the water it acquires force, and keeps the passage open. And if broken stone is employed not exceeding three inches in diameter, it affords no harbor for ground mice or moles, which otherwise get in and open passages to the surface, through which water and earth are apt to enter and choke up the drain. Drains of this description are very efficient and economical to keep the bed of a road dry, placed either at its sides or in the centre, having a fall to carry off the water. A cubic yard of stone will lay about 120 feet of under drain of the dimensions above given, and 8 inches deep. The breaking of the stone will cost three or four shillings the cubic yard.

The acknowledged utility of irrigation, or of spreading occasionally, the water from streams or the highways over lands, has led to a misapprehension with many of the principles of draining. Irrigation is employed to furnish water to soils, generally slopes where it is deficient, and from whence it speedily passes off, or to cover grounds in winter to exclude severe frost. The water thus employed is nearly of the warmth of the atmosphere, and is generally charged with fertilizing properties. Draining is employed upon flat surfaces, or upon slopes abounding in springs, where there is an excess of water, and of a temperature which materially chills and deadens the soil. Irrigation supplies water where there is a deficiency—draining carries it off where there is an excess. Both are intended by opposite modes to produce the same result—a suitable degree of moisture for the wants of the crop.

We have illustrations in abundance of the advantages of draining; and so apparent have been its benefits, in districts where it has had a fair trial, that a knowledge of the science, for a science it may be called, is considered an important branch of agricultural knowledge. Upon one estate in Scotland, where the farmers are generally tenants, sixty five miles of under drains have been made within a few years, at the joint expense of the landlord and tenant. The benefits of this expenditure have been—to the landlord an additional 5s. per acre upon his annual rental—and to the tenants a more than corresponding advantage in the increase of their crops. A gentleman who deservedly ranks high in this society, and has been a pioneer in this branch of improvement, has assured me, in answer to my inquiries, that he has applied under draining to twenty different fields, to the extent of more than two thousand rods, at the average cost of fifty cents per rod; and that he has been fully remunerated for the outlay in every instance, in the increased products of three years. In some cases, he adds, where the lands produced coarse grass of little value, and where tillage was out of the

question, he had expended twenty dollars per acre in under draining, and now grows upon these lands indian corn, oats, wheat and clover luxuriantly. The value of this land has been increased from twenty to one hundred dollars per acre, or five hundred per cent, by the operation of draining. I have had some personal experience in this sort of improvement, and have made it the subject of calculation, and am induced to believe that where stone is convenient, efficient and *permanent* under drains may be made as low or lower than what they cost my friend. A laborer accustomed to the work averaged ten rods per day upon my farm for thirty days. The ground was sandy and soft. Other materials were substituted for stone, which would, had they been employed, have required more labor, though they had been prepared to his hands.

The benefits of under drains are not limited to lands which show water upon the surface. We may often notice at midsummer that some flat lands have a sterile and compact appearance, whose general aspect would indicate fertility. This is readily accounted for by supposing what is often known to be the fact, that the soil repose upon a compact strata, which prevents the descent of water, and which has not sufficient inclination to pass it off. The water chills the ground, retards the decomposition of vegetable food, and causes comparative infertility. This may be effectually remedied by parallel under drains, the space between them to depend upon the compactness of the soil, a drain being supposed to collect the water nine or ten feet on each side in the most tenacious ground. It is usual where fields are thus drained to make a cross drain along the upper side, and also one along the lower side, to receive and carry off the water which the parallel drains collect from the soil.

Barley and hops are becoming important staples of our State, particularly of the northern and western portions. Few persons, I presume have a just conception of the quantity which we annually produce, or the immense loss which we sustain for want of better knowledge and more care in cultivating and preparing these crops for market. Our soil and climate are found to be well adapted to their growth, and we have produced as fine samples of both, as are grown in any part of the world. Independent of an increasing home consumption, the hop in particular is always in demand for exportation. If in good condition it is one of the most profitable crops to the grower that can be raised. If in bad condition, it is often a losing concern, not even affording a return for the labor bestowed in its culture.

Deeming the subject one of deep interest to the community, and as coming particularly within the province of this society, I have been at some pains to collect data from the best sources in relation to the barley and hop trade, with the view of submitting an abstract of the facts to your consideration.

Two-thirds of all the barley grown in the United States is believed to be marketed at Albany and the neighboring towns upon the Hudson. The amount brought to our market last year, is estimated at 450,000 bushels. It is of two kinds—two rowed and six rowed, one possessing a thin and the other a thick skin, and larger berry, ill adapted to be malted together, as one kind malts quicker than the other, and becomes sensibly deteriorated before the saccharine matter of the other kind

is fully developed. The two varieties are often mixed by the grower; but that which passes through second hands, as the merchants, boatmen &c. is almost universally so, and is besides frequently adulterated with oats and other foreign matters, which seriously depreciate its value. It is stated that the deterioration and loss consequent upon the bad condition of the barley brought to market the last season, was equal to ten per cent. or 45,000 bushels—which expressed in money at 75 cents the bushel, amounts to \$33,750.

Serious as our loss seems to be from the bad management of our barley, it will be found to be no less so upon our hop crop. About 2,300 bales or 50,000 lbs., is the estimated quantity brought to market the last year. Of this quantity I am assured by the best judges of the article there were not 200 bales which ought to have been denominated first sorts. Many of the hops were imperfectly dried, and in consequence of the moisture in them when bagged, a fermentation was induced highly detrimental to their quality. The criterion by which hops are determined to be well dried is, when the stocks become perfectly shrivelled and dry. This is not found to be the case with those sent to this market, and the effect is that deterioration goes on till the hops are used, whereas well dried hops lose very little of their goodness by being kept over. Again, too much heat, particularly in the outset, is prejudicial, as it drives off with the moisture the aroma or essential oil which gives value to the hop. A great portion of our hops are picked too early, before they are sufficiently matured, while other parcels are scorched or otherwise injured in the process of curing; and although they might bear a superficial appearance of being prime, most of them on critical examination were found to be extremely deficient in the principle which gives them value. While the average price may be stated at 18 cents, many of these hops are declared not to have been worth two cents the pound.

Here then, if the data which I have given are correct, are two of the staple productions of our soil, on which we have lost, or what amounts to the same thing, have failed to realize, from 50 100,000 dollars in a single year, *from carelessness or a want of knowledge in their culture and preparation for market.* To what extent might this sum be swelled were we to embrace in this inquiry the other products and labors of husbandry! A like disparity I apprehend, between good and bad management would be found to exist in almost every department of our agriculture.

(To be concluded in our next.)

From the Northern Farmer.

ROLLERS---SOWING GRASS SEEDS.

FARMERS, who are in the practice of using Rollers, to level and smooth the ground, are fully convinced of their great utility. How inconvenient it is to mow, when the surface is very uneven, or where small rocks lie upon it. And there is a loss of labor in being obliged frequently to grind the scythe, or in case of breaking to get a new one. In laying down the soil to grass in the spring, the roller makes "smooth work," and drives down the pebble stones and small rocks beneath the surface, and also renders the appearance of the fields more delightful. But the use of the roller is very beneficial in sowing grass seed. The harrow, unless made with very fine and very short teeth, ought not to be used; because the grass seed,

which the common harrow buries one, two or three inches beneath the surface, does not vegetate. In sowing grass seed, I now use only the roller, and it "catches in," much better than it does by harrowing it in. After a light, gravelly soil has been well ploughed and harrowed, it may often do very well to sow the grass seed upon the surface, before a rain. This fact, perhaps, well known to many, I learned by accident. I directed my hands to lay down a field with rye and grass seed. But they forgot to sow the grass seed, as I learned after the rye had sprouted. Believing that the use of the harrow would then destroy the rye, I scattered the grass seed upon the surface, and never had any catch in better. But there were several rains soon after. This experiment has induced me to use only the roller.

To make a roller some take a log, others a stone hewed round. Either is much better than none—but they often drag the small stones, &c. forward, instead of beating the same down perpendicularly into the ground.

A roller made of old truck or cart wheels is preferable. My men made one of a pair of old truck wheels in the following manner. A two inch white oak plank was cut into short pieces, one end of each piece resting on the hub, and the other end projecting about half an inch above the felloes by wooden pins. A heavy axletree was then put in, about seven feet in length; the ends projecting out of the hubs about five or six inches. The wheels were next covered with narrow thick pine plank, and spiked into the ends of the white oak plank. But the planks must be hewed, so as to form a perfect circle, previous to driving the spikes. The planks which cover the machine, must not only be very narrow, but thick; the edges being hewn obliquely, being well jointed, resting upon and supporting each other, and therefore capable of resisting a great external pressure. Narrow white oak plank, or small timbers are then to be formed in the shape of an oblong square. In the centre of the sides of this frame, a square hole is cut, so that the ends of the axletree may enter, and in this frame the roller revolves. To the front end of this frame the tongue or spire is attached, so that the machine may be drawn with horses or oxen. Many farmers now use rollers of a similar construction. Should it be desirable to pick rocks while operating with the machine, it would be easy to construct a box to be attached to the frame. The strength of the roller may be increased, by nailing iron hoops round the outside. I think that large are preferable to small wheels. In order to turn the machine with the cattle with greater ease, it may be judicious to have the circumference in the middle, a little larger than at the ends. But when the middle rests upon rising ground, or a little hillock, in the act of turning, there is no great difficulty.

Many farmers suffer their cattle, in the wet seasons of Spring and Fall, to graze in their mowing fields. By this practice the soil is not only beaten down and rendered uneven, counteracting the good effects of the roller, but the grass roots are much injured, and, by the fall feeding, are, indeed, more liable to be winter killed. It is a practice which ought to be discontinued. The inevitable consequence of it, is, either to reduce, or else prevent the increase of the quantity of hay.

W. CLAGGETT.

Portsmouth, March 24, 1834.

From Goodsell's Farmer.
CANKER WORMS.

MR. GOODSSELL,—Permit me through the columns of your paper, to communicate a simple and easy method of destroying the effects of that great enemy to our orchards, the canker worm. Six years since, while walking in the forest and examining the capsules of the *Castanea Americana*, or Chestnut Burr, the idea struck me, that they might be applied to advantage in preventing the effects of the canker worm. I took a piece of strong twine and sail needle, and made a band of them, placing all the backs one way, which caused the spines to project in all directions. I tied it round the trunk of an apple tree in the centre of an orchard, that was much injured the year before, which bore abundantly without the leaves being injured in the least, while those around, were all ruined for that year.

I have since tried it several times with entire success. A set of bands will last many years, if taken off when the insects have done ascending, and secured in a dry place. I have usually put the band on the trees about the middle of March.

In sections of the country where chestnut burrs are not easily obtained, I would recommend the use of the *Dipsacus fullonum* or Fuller's teasel; although I have never tried it, I have no doubt it would make a sufficient barrier to prevent the ascent of the canker worm. NATHAN RUGGLES.

New Haven, (Ct.) Feb. 26, 1834.

From the American Farmer.
NEATNESS IN GARDENS.

MR. LOUDON states that the want of neatness and cleanliness in gardens, often arises from causes, which, on first consideration, would seem to have a contrary effect. One of them is, that the gardener is always at home—always engaged in his garden. He becomes familiar and accustomed to the forms, appearances, and condition of the beds and plants; but if he should occasionally visit other gardens, his mind would be struck with the defects or superiority of his own, and thus be stimulated to further efforts.

From Goodsell's Genesee Farmer.
MAKING BUTTER IN WINTER.

MR. GOODSSELL,—I noticed in your 29th number, p. 229, some remarks on making butter in the winter season, by heating the cream. The importance of the subject, will, I think, be readily acknowledged by every one, who likes to have "his bread well buttered" in the winter as well as summer season.

The objects gained by the process described in the article to which I allude, are, an improvement in the quality of the butter, and a saving of time and labor in making it.

Now from the experience which my family have had in making butter, I am well convinced that the objects mentioned, will be more likely to be attained by the following method: Let the milk when taken from the cow, be heated very near to the boiling point, and then strained and set; the cream to be taken off and churned, as usual. I feel well assured, that all prudent house-keepers who make a fair trial of this method of treating milk, will be sure ever after in cold weather, to practise it.

If, as our Vermont friend suggests, "the secret lies in removing the froth, which rises in heating the cream," the same object is effected by heating the milk. I am convinced that there are other

objects accomplished by heating milk, which cannot be effected by heating the cream.

First, the quantity of cream from a given quantity of milk, is believed to be considerably increased.

Secondly, the cream does not acquire that bitter taste, so common with winter made butter, and which will be communicated to the cream, before the milk has stood long enough to have it all separate or rise.

Thirdly, milk so managed can be kept sweet much longer than in the ordinary way, which, when milk is scarce, is an object deserving consideration. Yours respectfully,

Springport, Feb. 10, 1834. JUSTUS GAGE.

STRAW WEAVING.

WE had the pleasure a few days since of witnessing the operation of weaving straw for the manufacture of bonnets, at the establishment in this town under the direction of Mr. J. P. Golding. There are now employed in this establishment upward of 100 females all engaged in weaving the straw into plaits or webs of about two inches in width. The variety of patterns is large, many of them very beautiful. In some the common rye straw of this country is interwoven with the Tuscan straw. The web or warp into which the straw is woven is composed of silk, doubled and twisted from the cocoons very fine, but yet sufficiently strong for the purpose. This silk is prepared as we are informed by Mr. G., by a son of his who is located in Mansfield, Conn. where for several years past a considerable quantity of silk has been produced. Mr. Golding was formerly a silk weaver in Manchester, England, and his family understood the culture of the worm, the manufacture and weaving of silk, and are said to be in the exclusive possession of this information in this country. Mr. Golding has already invented machinery and woven several patterns of silk vesting and webbing in this country, but at present this part of the business cannot be profitably carried on here. He intends, however, to prosecute the business, and has set out trees for that purpose at Dedham.

We have no doubt that the production and manufacture of silk will become a very important branch of American industry, as many millions of dollars are annually paid for the imported article. We have yet much to learn, but a few years will put the country in full possession of all the necessary information for carrying on successfully every branch of silk manufacture.

We notice by the papers that some silk handkerchiefs have been manufactured in Dayton, Ohio, under the superintendence of Daniel Roe, Esq. the product of the native mulberry. Their color is the natural color of the silk, and they appear to be a very durable article.—*Bunker-hill Aurora.*

From Goodsell's Genesee Farmer.
CANADA THISTLE.

MR. GOODSSELL,—Having seen a communication in your paper, over the signature C., dated Woodland, Dec. 16th, 1833, recommending as the most sure method of extirpating the Canada thistle from our soil, "to plough the ground, and sow it with large red clover, which he recommends to have mowed the first and second years, without feeding it, after which, the land may be ploughed, and sowed with wheat, when it will be found that the roots of the thistles are perfectly destroyed, so far as regards vegetation." Having myself practised a

method very similar, with complete success, I was forcibly struck with the propriety and accuracy of his remarks. I cannot account for the destruction of the thistle in this case, otherwise than that the clover grows earlier, and more luxuriantly than the thistle, and by overshadowing it, the thistle is kept in a dwarfish and sickly state, until the clover is mown, at which time the stalks of the thistle will be found hollow, and having a whitish, sickly appearance; and they will not immediately send up young shoots, unless the clover is fed off. It is advisable to mow them in a warm, clear day, and remove the crop immediately, that the sun may shine directly upon the emaciated stalks, which will not only retard their growth, but accelerate their destruction. I have written the above, as the result of my experience, and feel confident that any person who is troubled with Canada thistles, may adopt the course recommended by your correspondent C., without fear of disappointment, and that he will find his communication generally correct. JOSEPH EDDY.

Williamson, March 4, 1834.

NOTE. It is a well known fact, that neither plants nor animals, can enjoy good health, unless they have the advantage of light. Light is important in the elaboration of the juices of plants, which is furnished by the roots, and unless they are allowed to produce leaves, and those leaves have the action of light upon them, the juices continue thin and watery; circulation becomes languid, and the plant dies of a disorder as near dropsy, as the nature of the case will allow.—*Editor G. F.*

POPULAR SCIENCE.

WHY can white horses bear the heat of summer and the cold of winter better than those who have dark colors?

The reason is, because in summer their white covering reflects off the rays of the sun, and in winter it radiates off but comparatively little caloric from their bodies. For the same reason also a white dress is warmer in winter and cooler in summer than any other color.

The pitch of a piano-forte is lowered in a warm day and elevated in cold weather;—why?

It is in consequence of the expansion of the strings being greater in a warm day than the wooden frame work to which they are attached, and in the cold the reverse will happen.

A cask filled with liquid in the winter, will force its plug in summer or burst;—for what reason?

It is in consequence of the expansion of the liquid being much greater than that of the cask which contains it. Hence some very cunning dealers it is said, endeavor to make their purchases in very cold weather, and their sales in warm weather.—*Portsmouth Journal.*

CROUP.

FOR the benefit of all classes of our readers we give below in brief, the important part of an article on croup. Dr. Dewees is an eminent physician of Philadelphia, and is a professor in the University of Pennsylvania. From the fourth edition (1832) of his work we have made our extract:

Direction and recipe.—Rub the throat with the spirit of turpentine. Repeat this, if the first has not subdued the hoarseness, so soon as the redness occasioned by the turpentine, has nearly disappeared. The turpentine must not be used so as

to produce blisters. To aid this external application, give the doses suitable to the child, "the compound syrup of squills" or Cox's hive syrup, as an expectorant, or if necessary as an emetic.

If the hoarseness does not yield to the turpentine or to expectorant doses of the syrup, give the syrup by quickly repeating the dose, till it produce an emetic effect. Should the bowels be confined give a dose of castor oil. The diet should consist of barley water or flax-seed tea. The patient should be kept in a moderately warmed room, and not be exposed to a draught of air. The throat must be protected by a piece of flannel.

NEW MODE OF RAISING WHEAT.

In the Maine Farmer, we find a committee of the Kennebec Agricultural Society holding the following language:

"In this connexion we will call your attention for a moment to a new mode of raising winter wheat, that is pursued successfully in the state of Vermont. The ground is prepared in Autumn in the manner already pointed out, and the seed is taken late in the season, when the cold weather has arrived; and after being swelled, is boxed up, placed where it will freeze, and thus kept till spring, when as soon as the ground will permit it is sowed. The danger of winter killing is thus avoided, and we are told the crops of wheat are nearly doubled in the section where this course is pursued. The experiment is at any rate worth trying, and if it should prove successful, it may be the means of enabling us to increase very materially the amount of our crop."—*Goodsell's Genesee Farmer.*

From the Genesee Farmer.

USE OF THE ROLLER.

A very small proportion of the farmers in Western New York are provided with this valuable implement, and I am confident that very few of them would be without it, if they knew its value.

When my wheat came up in the autumn of 1832, I discovered that in one field my hired man had not sowed it evenly; but it was then, as I thought, too late to remedy it. In the spring it presented the same unpromising appearance, being so thin in many places, that I anticipated a short crop. Being disappointed in receiving my clover seed for the same field as early as I wished, I was apprehensive of a failure in that also, and to prevent it directed my son to roll the field. Witnessing the effect, in completely pulverising the crust which had formed on its surface, I was led to conclude, that the operation had not only placed the clover seed in a favorable situation to vegetate, but would benefit my wheat also; and therefore directed the residue of my wheat to be rolled. Business called me from home for several weeks, and on my return I was astonished to find that my wheat had spread so as to stand nearly as thick as I wished; and at harvest it appeared to be perfectly even and produced a fine crop. I think that I must have gained by rolling, at least one fourth. My clover seed took well.

Last spring I rolled after sowing and harrowing my oats, which came up very soon and regularly and produced a heavy crop.

The past autumn I rolled one wheat field immediately after harrowing, and I think it came up more equally and sooner for the operation. I have also rolled a part of two other fields, in order to ascertain whether rolling in autumn is beneficial to the wheat, the result of which I may hereafter

communicate. The only doubt I have as to its utility, arises from the belief that snow lying on wheat, is advantageous, and a fear that rolling the ground, will cause it to be more easily blown off. The above mentioned trial of rolling in the spring, is conclusive as to its benefits at that season. Another benefit resulting is, that the ground is left in so smooth a state, that the crop is much easier cut, and gathered with less waste.

I have also experienced great benefit from the use of the roller on green sward, ploughed in the fall, and left in a rough state through the winter. By passing the roller over it previous to harrowing, the inequalities are removed, and the operation of harrowing rendered much more effective.

I am led to believe, that in all cases where green sward is turned under for a crop, rolling must be beneficial, even when it is to be a naked fallow, closing the interstices, and the compression having the effect to produce a more equable and thorough decomposition of the sward.

The effect of a roller on mowing grounds, is to enable the mower to cut the grass closer, and to prepare the land for the use of the horse rake; an implement which, with a horse and boy, will do the work of six men.

Now is the time for every farmer not already furnished with a roller, to procure a stick of heavy white oak, two to two and a half feet diameter, and six feet long, use gudgeons made of one and a half inch iron; drive them in the centre of the stick, then raise it so that the gudgeons will rest on blocks, when there will be no difficulty in bringing it to the shape of an exact cylinder. All that remains to be done, is to make a stout frame and tongue, the latter well braced. ONTARIO.

TO LABORING MEN.

It is an admitted fact that manual labor is the employment most conducive to the happiness, and at the same time most congenial to the health of man. Still there is a fault in the habits of our laboring men to which we invite your attention. That to which we allude may not be general, but that it prevails in a degree is certain. It is the habit of laboring violently for a time until a piece of work is finished, or nearly so, and then relaxing their exertions to recover from the fatigue, and perhaps sickness, occasioned by this imprudent course of conduct. This is ruinous to health and almost fatal to business. Regular, constant labor, without violent exertion, is most profitable, not only because more is accomplished, but because it is done in a better manner. It is the best preservative from diseases, and a certain cure for that worst of all diseases, *Laziness*. The man who labors regularly every day almost invariably enjoys good health. He is not troubled with indigestion, more fashionably called *Dyspepsy*, and the many nameless complaints that afflict the occasional laborer, or him who does not labor at all. Let a lazy man once get in the habit of constant labor, and he will almost forget that he does not love it. There are many who say that they are not able to work constantly, and no doubt they think so. No doubt there are many who really are not. But let us look at the habits of some of these feeble men. They are certain they cannot work every day as some of their neighbors do, for only a few days work, as they work, merely through the planting or haying season, bringing on sickness from which they do not recover for weeks. They receive but little nourishment from their food, nor are they

much refreshed by sleep: and who can doubt that they are sick? No one. Nor do we doubt that if very many of those men were to reform their habits they would be improved, and instead of days of tedious labor, and sleepless nights of pain, they would enjoy all the blessings of health attendant on regular constant employment.

From the Cultivator.

DRAINING.

Ballston, Dec. 3d, 1833.

To the President of the N. Y. S. Agr. Society,

In reply to your letter of the 27th ult. in which you ask me to state to you the result of my experience of the utility and expense of under-draining farm lands, I have to observe that it is a subject to which I have devoted some attention for the few years during which I have had an interest in agricultural pursuits, and my opinion of its great utility is confirmed by every successive day's observation.

I have applied under-draining to twenty different fields, to the extent of more than two thousand rods, and compute the average cost at half a dollar per rod. The expense however is determined by the proximity of materials, and the economy with which the work is performed.

I am convinced the operative farmer who performs his own labor, can effect similar improvements considerably less than I have stated.

In some instances the state of my lands required an expenditure of at least twenty dollars per acre in draining. In such cases the production was coarse, unwholesome grasses, of little value, and tillage was quite out of the question. Twenty dollars per acre was the extent of the value of the land; whereas, after being effectually drained and cultivated, these lands have produced Indian corn, wheat and clover in great luxuriance, paying an income on one hundred dollars the acre.

Every practical farmer is aware of the inconvenience and disadvantage attending the cultivation of fields, the different parts of which are so various as to preclude a uniform crop and uniformity of cultivation. Draining is the remedy for this.

As the improvement here treated of, is of the most enduring nature, it would be unfair to charge the expense attending it, upon the product of a single year. My belief is, that I have been fully remunerated by the increased products of three years in all cases; and further, in nearly every field I have, at the termination of the stone drains, durable supplies of water for animals, which, in my estimation, fully compensate the whole expense incurred.

Upon the whole, I know of no subject connected with agricultural improvement, of more importance, than draining; and if these facts I have detailed at your request, should lead a single individual to experiment on this subject, I shall deem the hour occupied in the detail fully compensated.

I am, Sir, very respectfully, your obedient servant,

HENRY W. DELAVAN.

ITEMS.

Rheumatism. A strip of gum elastic applied to any joint affected with the rheumatism, has been found in all cases an infallible remedy, says the Lebanon Republican. The perscription is simple enough to warrant an experiment.—*Greenfield Mer.*

Stains by Fruits are readily removed from clothes by wetting them, and placing them near lighted brimstone; a few matches will answer the purpose.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, APRIL 9, 1834.

For the New-England Farmer.

THORN HEDGES.

Bangor, March 29, 1834.

Will you please to inform me by an early opportunity, as to the mode of culture in relation to the Hawthorn—particularly the length of time the plants should remain in the seed-beds, before planting into the nursery? I cannot find, either in the Farmer or American Gardener, or any where else, the time required, or the space between each plant in the seed bed.

I obtained about ninety thousand seeds of two kinds of thorn, which grow here spontaneously. As I am unacquainted with Botany, I cannot tell the species, and can only describe them as follows: The first bear berries in clusters, of from twenty to fifty, and the second one single. Thorns of the one, (the first) are long and slender, the latter are short and rather thicker.

An early answer, by mail if convenient, to my address, will confer a favor on a pioneer in Live Fences, down East.

I remain, with great respect and esteem,

Yours respectfully, WM. COOMLY.

BY THE EDITOR. Although our correspondent requests a private answer, perhaps it may be as well to publish what information we can give on the subject of his letter, as we may perhaps, thereby, communicate information of which others among our readers may avail themselves.

We are not sufficiently acquainted with the different kinds of thorns, to be able to say which of the above-mentioned varieties, is to be preferred. Probably either will answer. The Hon. J. Quincy, formerly eminent as a practical, as well as a scientific agriculturist, now President of Harvard University, has given a statement of his manner of making hedges of the American hawthorn, (*Crataegus cordata*), which was published in the third vol. of the *Mass. Agr. Repos.* p. 27. The seedling thorns (ten thousand) were obtained from the nursery of Thomas Main, near Georgetown, D. C. and planted in a hedge course of two hundred and fifty-five rods; so far as was necessary to fill that extent in one line, each plant being two inches apart. The residue were planted in a nursery, for the purpose of filling vacancies.

The hedge course was made in sandy land, ploughed of the width of four feet, and manured, and prepared precisely as for Indian corn; except only, that after ploughing, the centre for two feet wide, was turned over with the spade, and the hedge planted without further preparation. Mr. Quincy advises to the following course: "Plough the hedge course six feet wide. Plant the whole course one year to potatoes. This pays for the labor, as much as any other land thus planted. Set the thorns eight inches apart. This is near enough in a country like this, where hogs are not permitted to run at large, and makes a considerable saving in labor, as well as the cost of the plants. Keep both sides of the hedge planted with potatoes, during the whole six years that the hedge is coming to perfection. The potatoes will nearly pay the cost of the labor. The manure for the potatoes benefits the hedge, and while hoeing the potatoes, keeping the hedge clear of weeds is easy.

"To keep the hedge clear of weeds, and to fill up the vacancies regularly in the spring of every year, with plants of the same age with those of the

original hedge are the two essential objects of attention, after the hedge course is prepared, and the plants are set. Younger plants may answer, but whoever would make a hedge in the most speedy and perfect manner ought to procure at the time of obtaining the plants for the original hedge, a sufficient extra number to supply all deficiencies likely to occur during the whole time the hedge is forming; to be kept in a nursery, thriving if possible a little better than those in the hedge course."

With respect to the age at which plants for hedges ought to be used, Loudon says "three years old are certainly the youngest that should be transplanted, and if they are six or seven years old, so much the better; the prevailing idea that plants of that age will not thrive if transplanted, is totally unfounded." He likewise recommends assorting the plants, and setting those together which are nearly of a size: because, "when no pains have been taken in assorting the plants, and they are planted promiscuously, great and small, strong and weak, the consequence is, that the strongest plants, very soon outgrow such as are weaker, and not only overtop them, but also deprive them of that nourishment, which they so much require. As the hedge advances in age, the evil becomes greater; small stunted plants, and innumerable gaps appearing throughout the whole line of the fence, interspersed with others remarkable for their strength and luxuriance.

"This assorting of hedge-plants has another advantage; namely, that of putting it in the power of the person who plants the hedge, to put down the large, strong, healthy plants upon the poorest parts of the line of fence, and to set such as are smaller and weaker, upon the richer and more fertile parts. He has it also in his power, by a more careful preparation of the soil, and bestowing a greater proportion of manure on the places where the plants are set, to give them that nourishment and assistance which they require, and which would soon enable them to form a fence equal to that part occupied by the strongest plants."

For further information on the subject see an article, written by Dr. B. Shurdeff, N. E. Farmer, vol. ix, p. 209.

ROTATION OF CROPS.

"I cannot withhold the expression of my approbation of the article in the last number headed 'Rotation of crops.' The 'Monroe Farmer' understands his business and I hope will often favor us with the result of his experience. I should however differ from him in one respect. I have found by experience, that when a spring crop is taken off and wheat is to follow, the best method is to harrow thoroughly, immediately, which causes all the seeds of grain which may have scattered, or of weeds to vegetate. About two weeks before seeding, turn all the green stuff and stubble under the soil, there to remain and rot. If ploughed the second time, much of the stubble is brought to the surface and lost."—*Genesee Farmer*.

THE LOCUSTS ARE COMING.

ATTENTIVE observers of passing events have ascertained that immense swarms of Locusts appear in this country once in seventeen years. The last visitation was in 1817, and they will probably make their re-appearance in the month of May.—*Mer- cantile Journal*.

Scions from the same gentleman of the Hawthorndean apple, to whom was awarded the first premium for this fruit, were received and distributed. For the Committee,

B. V. FRENCH.

N. B. A special meeting of the society will be held at their room on Saturday next at 11 A. M.

The Magnolia, Glauca, or White Boy, producing fine fragrant flowers, as brought yearly from Gloucester, will be furnished by a gentleman from that place, with the roots enveloped in earth and packed each in a box, by applying at the Society's Room on or before the 15th inst.

ITEMS OF INTELLIGENCE.

Bangor Horticultural Society. Those who took note of the proceedings of the last Legislature, will recollect that such a Society as the above was incorporated. Who were its originators, or what their purpose, was but recently understood. It is now given out, that it is their intention to procure a suitable spot in this vicinity for horticultural and culinary purposes, that the Bangor Market may be supplied with whatever this climate can afford.

In connexion with this they have another equally laudable object, viz.; that of procuring some suitable site for a cemetery, on the plan of Mount Auburn in Cambridge. The details of their plans, as well as the terms upon which membership may be obtained, will be more definitely made known hereafter by the projectors.

Antigua. An act has been passed by the Legislature of Antigua, abolishing slavery in that island after the first day of August next. In November last the Governor at the request of the Legislature, addressed the British Government for information, whether unconditional abolition would be permitted, in lieu of the gradual system provided by the act of Parliament. A reply was received stating that the wishes of the Legislature were entirely in accordance with the views of the Government and the spirit of the act of Parliament. The act of total and unconditional abolition was accordingly passed by the Assembly on the 13th of February, and the Council on the 15th.

A great Yield. Mr. Daniel Griggs of Chaplin, raised the last year, on three acres of ground, one thousand and fifty pounds of clover seed, of superior quality; amounting at 12 1-2 cents per pound, to \$131 75.

Gold. It is stated in the city papers, that a Gold mine has been discovered in York county, by Calvin Mason, Esq., and Dr. John Fisher of York. A bill is now before the Legislature for the incorporation of a company to mine for gold in Lancaster, York and Adams counties, and it is said that the precious metals have been discovered in two of the counties by the company that ask to be incorporated.—*Pa. Tel*.

The bank of Maryland at Baltimore has suspended payment.

It is also stated that the Bank of Chillicothe, Ohio, has failed. It had rising of a million of the Government deposits.—*Id.*

Sheep killed by Cats. Incredible as this may sound, we have good authority for saying the deed has actually been perpetrated in this county. Several cats of the common species with their progeny, have for three or four years past made an old stone quarry in Martine township their abiding place, and in that time it would seem have relapsed to the wild state and acquired the ferocious and predatory habits natural to their tribe. A short time ago some of them were seen in pursuit of a full grown sheep belonging to the flock of Mr. Martin Herr, of that vicinity. They soon overtook it, dragged it to the ground, and before the person who witnessed the scene could reach the spot, they succeeded in so lacerating the poor animal's throat, that it bled to death in a short time. It required considerable exertion to drive them off. A dog subsequently sent in pursuit of them, caught one, but would probably have been himself worsted in the conflict that ensued, had not the owner come to his rescue. It is said that they also pursued a small boy some time ago, and followed him a considerable distance, as is now supposed with deadly intent.—*Lancaster Examiner.*

Highest Tavern in Europe. A tavern has been built on the summit of Mount Fulhorn in Switzerland: it stands at an elevation of 8140 feet above the level of the sea. As a matter of course, its guests one and all, *get high*, and are charged high for their refreshments.

People of Importance. Nobody likes to be nobody, but every body is pleased to think himself somebody; and every body is somebody, but the worst of the matter is, when any body thinks himself to be somebody, he is too much inclined to think every body else to be nobody.

BRIGHTON NURSERIES.

MESSRS. WINSHIP have received by the Morea, the following new kinds of Gooseberry Plants, in addition to those before advertised:

Reds.—Pearsons Markman, Manchester Ashton Seedling, Warrington red, Sportsman, Crown bobs, Leyfret's seedling, Rider's Old England, Achilles

White.—Hall's conqueror of England, White Smith, Duke of York.

Green.—Green Walnuts, Jolly Tar, Sovereign, Moor's Liberty.

Yellow.—Noncuch, Trafalgar, Prince of Orange, Yellow Sulphur.

Also.—Purple Beech Trees; Linden, and other varieties of Limes; Scotch Larch; Double and Scarlet Flowering Hawthorn, Moss, Sweet briar and other double flowering roses. Spireas, Clematis, Honeysuckles of various new kinds. Rhododendrons Arboreum hybridum, Catawbiense, and Ponticum, with many other new and rare plants.

Orders for the above or any other nursery productions, may be left with G. C. BARRETT, Agent, No. 52 North Market-st., Boston, or forwarded to Messrs. Winship, Brighton, Mass., by mail or otherwise. Orders will be despatched immediately, if requested.

Catalogues for gratuitous distribution, at the New England Farmer Office and Seed Store of G. C. BARRETT. m 26.

PAINT OIL.

The subscribers keep on hand a constant supply of their "Prepared Paint Oil," which is offered for sale with renewed assurances of its merit. This Oil, independent of being 25 per cent. cheaper in price, will actually cover a quarter more surface, as has been repeatedly proved and confirmed by statements of many Painters. Upwards of 200 buildings in this city and vicinity can be refitted to, many of them painted two years ago, which continue to look well, and retained their gloss through the first year, which is a clear demonstration of its strength. The Prepared Paint Oil is found to answer a valuable purpose to mix with Linseed Oil, giving it strength and durability with a more permanent gloss. It paints a very clear white, flows smooth, and is more free from milldew, and changes resulting from the sea air, than any other Oil.

Oil Factory (head Foster's Wharf.)

DOWNER & AUSTIN.

P. S. Please be particular to order Downer & Austin's "Prepared Paint Oil." m 19's.

THE ALBANY NURSERY,

Is now supplied with a large assortment of Pear trees, in addition to its general assortment of Tress and Shrubs, which embraces most of the kinds on demand. Price 37 1-2 cents. Its collection of Dahlias contains more than 300 fine double varieties, and is surpassed by none in the Union. Orders will be received by GEO. C. BARRETT, at the N. E. Farmer Office. BUEL & WILSON. Albany, March 7, 1834. 41.

SITUATION WANTED.

A young man with a family, who is well acquainted with taking charge of a Farm, wishes a situation as foreman. Good recommendations will be given. Inquire at this office.

SITUATION WANTED.

A middle aged man wants employment as a Gardener or Farmer; or will attend to them both if required, which branches he has been acquainted with for many years in England and America. He possesses the most unequalled recommendations. For particulars apply to the Rev. Mr. Neal, South Boston; No. 233 Hanover Street, Boston, opposite the Globe Hotel; or No. 165 Ann Street. m 19

TEA SPRING WHEAT.

25 BUSHELS of this valuable variety of SPRING WHEAT, of which a trial of three years has proved it to be a productive kind, not liable to blast or mildew. There was raised last year 25 bushels to the acre, and being a sure crop, making the best of flour, it is recommended as a superior variety. For sale at the New-England Seed Store, by GEO. C. BARRETT, and also to be obtained of JOHN PERRY, Sherburne, Mass. m 12.

MISCELLANY.

The following was sent to us, together with the vegetable production composing its theme. The poetry indicates that a "*Mammoth Gourd*" which figures therein was not a *creeper*, but a *climber*, and we take it will obtain as much celebrity as if it were hung to the *horns of the Moon*—or more poetically, were pendent from the Indispensable of the Goddess Diana.

FRIEND FESSENDEN! This mammoth Gourd
Is not a fruit to grace your Board;
Nor do I think 't was ever meant
A sauce for meat or condiment;
Nor was it part of my design
To form a Goblet for your Wine,
Or I had sent you ten at least
For closing bumpers at a feast.
My Neighbors send you mammoth fruit,
I had a wish to follow suit;
A Calabash of such a size
I hope and trust you'll not despise;
I only fear 't will puzzle you
To know what use to put it to.
Falstaff alive—his lips would smack
At such a Goblet full of sack;
Nor Hal object to have its mate,
Nor either think the size too great.
I have on hand at least a score,
Which I shall use as heretofore;
Shall save the seed to feed my Hens,
And mount the shells for breeding Wrens.

Your friend, ANONYMOUS.

NATURE'S WARDROBE.

DAME NATURE has but few changes of dress, but in these she makes her appearance at times so unexpectedly and so tastefully as often to surprise us into delight; but yesterday she was "clad in sober grey," to-day she appears robed in virgin white, and not only has she decked her hills and valleys in this romantic attire, but even the crested trees and shrubs sparkle with her diamond frost-work. What the fickle lady means by this display we cannot divine, unless there is to be a marriage between the seasons, Mr. Winter and Miss Spring, and this is her wedding garb.—Of late years this couple have been much together, and we strongly suspect such an union has been contemplated; but we protest against the bauns, and hope they will remain asunder.—*Bangor Courier*.

From the Art of Money Getting.

ECONOMY OF TIME.

A MAN in business of any description, ought to consider his time as valuable as his money.

We have heard something like the following anecdote, which is a capital example of a judicious course by men of professional, mercantile, or mechanical business.

A physician of my acquaintance called on a brother of the profession, living in — street. In the course of conversation, he inquired, "How is it, doctor; the world says you are growing rich, and accumulating beyond all account? How do you do it? What is your secret? For my part, with all possible management, and a practice as you know by our occasionally comparing notes fully equal to yours, I find that I can do little more than make my receipts adequate to my outgoings."

"Step into the entrance hall with me, and I will explain the matter," was the answer.

They adjourned to the place, where the doctor showed his friend the whole secret. It was his

hat and gloves lying on a table, opposite the street door.

"I understand you," said the medical friend, laughing and wishing him a good morning.

The reader, perhaps, would like an explanation. The moment a rap was heard, the first object that presented itself on opening the door was the doctor, with his hat put carelessly on, his cane under his arm, and drawing on his gloves.

"We are come to dine and take a bottle of port with you," was sometimes the salutation.

"Nothing could be more unlucky," replied the wary economist of time, "I have not yet seen half my patients, and am this moment sent for to a great consultation on a *bad liver case*, which will require considerable time and attention. Great as is the disappointment, business must be minded. Let me have the pleasure of your company another day."

With these words he moved forwards, and wished them a good morning. A repetition of almost the same story to every visiter at that hour, soon cleared his house of dinner company. He accumulated a handsome fortune, collected scarce books, and erected a handsome seat in the country.

WOMAN.

To the honor, to the eternal honor of the sex, be it said, that in the path of duty, no sacrifice is with them too high or too dear. Nothing is with them impossible, but to shrink from what love, honor, innocence, religion requires.

The voice of pleasure or power may pass by unheeded, but the voice of affliction never. The chamber of the sick, the pillow of the dying, the vigils of the dead, the altars of religion, never fail to excite the sympathies of woman. Timid though she be, and so delicate that the winds of heaven may not too roughly visit her, yet she fears no danger, and dreads no consequences. Then she displays that undaunted spirit which neither courts difficulties nor evades them; that resignation which utters neither murmurs nor regret, and the patience in suffering, which seems victorious even over death itself.—*Judge Story*.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Albheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

REDUCTION IN PRICES OF TREES, &c.

WM. PRINCE & SONS have determined in consequence of the pecuniary pressure, to reduce the prices of a great variety of Trees and Plants, where orders are sent for a considerable amount: and all persons who desire Fruit and Ornamental Trees; Flowering Shrubs and Plants; Greenhouse Trees and Plants; Splendid Dahlias; or Seeds—will on applying to them direct by mail, with a list of the articles wanted, be promptly furnished with a printed sheet explaining the reduced rates.—The Chinese Mulberry, or *Morus multicaulis* are now reduced to \$25 per 100, and \$44 per dozen.—Apple trees in great variety \$20 to \$45 per 100.—Pears \$37½ per 100, and extra large ditto 50 cents each; and 50,000 are two, three, and four years grafted.—Peaches \$20 and 25 per 100.—Large Orange Quinces \$30 per 100.—English and Spanish Filberts \$25 per 100.—Fine Red Raspberries \$6 per 100.—Large Red and Yellow Antwerp \$16 per 100.—Gooseberries, finest Lancashire varieties \$20 per 100; and Large Red White and Black English Currants \$16 per 100.—Isabella Grape, 3 years old vines \$25 per 100, and 2 years ditto \$20 per 100.—Catawba, Alexander, Winne, York Claret, York Madeira, and Scuppernon, \$25 per 100.—Herbomont's Madeira, Troy and Elsingburgh, \$30 per 100.—Norton's Virginia Seedling \$35 per 100.—The collection of choice European Grapes is unrivalled.—Chinese Ailanthus, 4 feet high, \$4½ per dozen and larger sizes in proportion.—A reduction is made on a great many kinds of Roses, Pæonies, Chrysanthemums, &c.—Double Dahlias of such fine assorted kinds as have been most increased, will be supplied at \$3, \$4½ and \$6 per dozen, according to excellence, and selected by ourselves. The roots can be sent to any distance.—The new varieties of Flemish and English Pears having been introduced by us and greatly increased, the prices of the greater part have been reduced, and the trees are mostly of fine size and three years ingrafted.—The Ornamental Trees and Shrubs of most kinds are large and thrifty, and of double or treble the value of smaller ones, which is a most decided advantage, being a gain of several years in embellishment.

N. B. Having no Agent at Boston, the Commission of 10 per cent, usually allowed for Agency, will be credited to the purchasers, and be deducted from the amount of the bills rendered. The stock of Dahlias being so very large, they will be furnished on the most favorable terms possible. Linnæan Botanic Garden and Nurseries, }
Flushing, near New-York, Feb. 10, 1834. }

APPLE TREES FOR SALE.

3600 budded Apple Trees, consisting of Baldwins, Russets, Siberian Crab, Porter, River, Rhode Island Greenings, and Blue Pearmain. The above are very thrifty Trees, and in fine order for transplanting, being four years from the bud. Inquire of JONAS WYETH, Fresh Pond Hotel, Cambridge. March 13, 1834. 81

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

1 Case wet (but not damaged) Bishops Lawn.
1 do. do. do. Book Muslin.
Also, 1 do. Superfine 6-4 Cambrie Dimities, which will be offered by the Piece at 25 per cent. less than cost of importation.
March 14, 1834.

GOOSEBERRIES.

A new importation of superior kinds, just received, of all colors, by
WM. KENRICK, Newton.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

VOL. XII.

BOSTON, WEDNESDAY EVENING, APRIL 16, 1834.

NO. 40.

ADDRESS OF J. BUEL, PRESIDENT OF THE
N. Y. STATE AGRICULTURAL SOCIETY,
Delivered at the Annual Meeting, Feb. 12, 1834.

(Concluded from page 297.)

Division of labor, although not so well adapted to farm labor, as it is to the mechanic and manufacturing arts, is nevertheless susceptible of being advantageously studied and applied by the husbandman. The process of pin making is subdivided into seven branches, to each of which is assigned a distinct set of hands. The advantages which result from this arrangement may be appreciated when I state, that were the workmen who whiten the pins to perform all the different processes, they would cost in making "three times and three quarters as much as they now do by the application of the division of labor." This principle is extensively adopted in manufactures, and is no inconsiderable cause of the reduction in price of their fabrics. It has been advantageously introduced in the farming of Great Britain. Men are kept as much as possible to the same branch of labor, because by becoming familiar with it they perform more and do it better, as a greater individual responsibility rests upon them. All light work is performed by women and children. A man who can earn six shillings should not be employed on what a boy can do equally well who is paid two shillings per day. Say a farm affords one hundred days of this kind of labor in a year—the gain to the cultivator by employing the boy instead of the man will amount to fifty dollars.

New articles of culture.—Forty years ago cotton was hardly recognised as an article of culture in the United States. In 1832 it constituted by far our greatest material of export, the quantity exceeding three hundred and twenty two millions of pounds, and the estimated value falling but a fraction short of thirty two millions of dollars. In addition to this, the home manufacture of the raw material now gives employment to half a million of our population, while the goods fabricated from it, constitute a material source of our internal commerce. Who can pretend to say what will be the great staple of our country forty years hence? Almost every discovery in science calls into existence a new art, and almost every new art furnishes a new demand for some product of the soil. It is the province of wisdom to keep pace with the knowledge of the times, that it may profit by its constant improvements. There is already an increasing demand for products of the soil, which we have the ability to supply, but which we continue to import from Europe. Madder, woad, and weld are essential to our manufactures, and the quantity which is consumed draws no inconsiderable amount annually from our country. Our soil and climate are adapted to their culture, and with a little enterprise and experience we may soon be able to supply the home demand. The madder now imported is computed to cost more than two millions of dollars per annum.

The turnip culture will yet become, as it has proved in Britain, the basis of a great improvement in our husbandry. Turnips are at the same time an ameliorating and a cleansing crop, and are admirably fitted to precede barley or wheat.

But their chief value consists in the abundant product, and the adaptation of the crop to the wants of all descriptions of farm stock, at a time when succulent food is most wanted, and when it can be but scantily supplied from other crops. The Swedish variety has a decided preference. On lands adapted to their culture, 600 bushels, or twenty tons of roots from the acre, may be stated as a moderate average crop. The greatest objection to their culture is the labor and expense of securing them for winter use; but this is far greater in imagination than in reality. On this subject I can speak from personal experience. A neighbor raised last year from five acres of land, three thousand bushels, which he has fed during the winter, and upon which he is now fattening more than one hundred wethers, besides oxen.

The raising of mulberry trees and the production of silk, is another branch of rural labor yet new among us, which bids fair to become a source of individual and national wealth, and which this Society can enlighten and promote. The experiments already made have shown that while the business abstracts very little labor from the ordinary employments of the farm, it is susceptible of yielding a handsome income to the farmer. The early attention of this Society in distributing seeds of the mulberry, has done much towards introducing and extending this branch of labor. It is computed that that seed may have produced half a million of trees, and that this number may have been doubled by individual efforts in that time. A new species of the mulberry, (*Morus multicaulis*) has been introduced from the Philippine islands through France, by M. Perrotet, which promises new advantages in the production of silk. The tree is as thrifty and as hardy, and as easily propagated as the white mulberry, while the leaves being much larger, are far more easily gathered, and are said to be better adapted to the production of fine silk, than the other species of this tree. This Asiatic mulberry was introduced into France in 1824, and in 1830 it bore seeds abundantly. I would beg leave to suggest that the corresponding secretary be instructed to procure seeds of the *Morus multicaulis*, with a view of its being distributed by this Society.

The demand for silk fabrics is already great in the United States, and is likely to increase in a far greater ratio than our population. The importations of silk in 1832 amounted to ten million dollars. As an article of export, the raw material will be in demand for the European, and the manufactured fabrics for the South American market. France imports raw silk to the value of 30 million francs, and in Great Britain the annual importation of the article exceeds 120 million dollars. Hence there is little danger of the market becoming overstocked.

The contrast in the profits of good and bad farming is worthy of a moment's notice, as few take the trouble to scan it with care. I have already alluded to the bad management of our hop crop. Had all the hops which were brought to this market the last year been equal in quality to the best, and such they probably might have been with better knowledge, and more care in

their management—some 20 or 30 thousand dollars might have been put into the pockets of the growers which they failed to obtain. Let us examine what the difference is in the corn crop. I estimate the cost of cultivating and harvesting an acre of corn at fifteen dollars, and that a farmer will ordinarily plant four acres. His expense then will be sixty dollars. If the crop yield him thirty bushels an acre—and more falls short than goes over this quantity—and he sells the product at fifty cents the bushel, he will be remunerated for his labor, but get not a cent of profit. Now, if instead of thirty, the acre was made to produce, by good management, eighty bushels, the four acres at the assumed price, would pay for the labor and afford him a net profit besides, of one hundred and thirty dollars. Here then would be a difference in one year, in the profit of four acres, of \$130, all resulting from good and bad management. I beg leave here, as affording to my hands a happy illustration of the contrast I would exhibit, to notice the practice of an individual who stands deservedly high as a practical farmer, and as a gentleman of respectability and veracity. I will show what his land did produce; and then what it does produce. "The land I now till, (he observes in his letter which will be hereunto appended,)* at first, would not produce on an average, more than 15 or 20 bushels of corn, ten or fifteen bushels of wheat, barley, or rye, and from half a ton to one ton of hay." By good management, economizing manures, and a proper rotation of crops, he adds "some of my fields now yield from 80 to 100 bushels of corn, 35 to 40 bushels of wheat, 50 to 60 of barley, and from two and a half to three and a half tons of hay per acre, and with less labor (except in harvest) than when I did not raise more than one third or one quarter as much per acre as I do now." The same intelligence and industry, that have trebled or quadrupled the profits of this farm, will produce like results whenever they are diffused and brought into exercise.

I have thus adverted gentlemen, to those defects in our husbandry, to which I proposed at this time to call your attention, and have endeavored to show their magnitude, and the importance of applying efficient remedies. I will now call your attention to some of the available means of placing our agriculture on a more respectable and productive basis. The means which I shall particularly commend to your notice, may be embraced under the following heads:

1. A school to illustrate the principles of science upon which the labors of agriculture are based, and to teach the best models of practice.
2. A more general diffusion of useful knowledge, in a cheap form, accessible to the humblest condition in life.
3. Agricultural associations; and,
4. The bestowments of pecuniary rewards, as stimulants to enterprise and industry.

I need not stop to dwell upon the advantages which learning affords to agricultural labor: Science may be defined a study of the immutable laws of the Creator, which govern and regulate mind and matter. The study of these laws and

* See letter of Earl Stimson on fifth page (317) of this No.

their application to the wants and comforts of life, have for ages constituted one of the highest and most useful employments of man; and have contributed more than any other human effort, to refine and elevate us above the grosser and degraded condition of savage life. The concentrated benefits of these labors are not proffered to our hands. The pleasures and the benefits which they impart, are held out as noble rewards to mental labor, in the same spirit that the blessings of health and competence are promised to him who "earns his bread by the sweat of the brow." Labor, mental or bodily, is the inseparable attendant of rational enjoyment. And is that knowledge to be contemned, which has done so much good to the world, and which has countless blessings yet in store for the human family? "In a *Theological view*," says a late eminent writer,* "science is nothing else than a rational inquiry into the arrangements and operations of the Almighty, in order to trace the perfections therein displayed. And what" continues our author, "are the truths which science has discovered? They may be regarded as so many rays of celestial light, descending from the great source of intelligence to illuminate the human mind in the knowledge of the Divine character and Government, and to stimulate it to a still more vigorous exertion in similar investigations, just as the truths of revelation are so many emanations from the 'Father of Lights,' to enlighten the darkness, and to counteract the disorders of the moral world."

Our state may be compared to a great family, the members of which are employed in diversified pursuits, all designed and calculated to promote the common weal—having a common as well as individual object, and all united by reciprocal ties. In this light it is considered as respects crime and want. One is punished, and the other relieved, by common consent and at the common charge. We have erected splendid and extensive establishments for the vicious and the poor. The county of Albany has been at greater expense for its poor than would be required of the State to establish and support a school of agriculture. Would it not evince both prudence and economy to endeavor to prevent, or to lessen these growing evils in society, by devoting a portion of the common means to schools, which should teach the hands useful labor and imbue the heart with the love of virtue? The adage teaches, that "an ounce of prevention is worth a pound of cure."

If ignorance be one of the chief causes of vice, and indolence the parent of want; and if knowledge be one of the main springs of virtuous conduct, and competence the sure reward of industry,—then the more knowledge is diffused, and the more industry is encouraged, the less we shall be called upon to expend upon poor-houses and penitentiaries. It no longer admits of doubt, that knowledge and industry are the great conservators of public morals, as well as the great instruments of public wealth.

It has been remarked, that the more we provide for any one class, the more it will increase. This would seem to hold good in regard to the vicious propensities of our nature, and why not in regard to habits that are commendable and praiseworthy?

To speak practically. Our agriculture is greatly defective. It is susceptible of much improve-

ment. How shall we effect this improvement? The old are *too old to learn*, or rather to unlearn what have been the habits of their lives. The young cannot learn as they ought to learn, and as the public interests require, because we have no suitable school for their instruction. We have no place where they can learn the principles upon which the *practice* of agriculture is based—none where they can be instructed in all the modern improvements of the art. It is devoutly to be hoped, that our fathers in council, justly appreciating the importance of the subject, will add another to the proud trophies which New York has already won in the noble march of improvement, by properly responding to the correct views of this subject expressed in the message of our chief magistrate.

Our periodical publications, devoted to the interests of the agricultural and mechanical classes, have proved highly beneficial, and are daily enlarging the sphere of their influence. These benefits, however, may be greatly multiplied, by a cheap work, adapted to the means of persons in humble circumstances, and to the economy of those who are able, but unwilling to expend two or three dollars a year for an agricultural paper. It is believed there are more than 200,000 farmers in the State who read little or nothing calculated to improve their knowledge in the business by which they live. With the view of bringing this subject before the Society, I have made inquiries as to the price at which a respectable publication of this character can be printed. The estimates have been predicated upon the supposition that the editorial labors will be gratuitous—that the subscriptions will uniformly be paid in advance—that arrangements will be made to give it an extensive circulation, and that an edition of at least ten thousand copies will be disposed of. The result of my inquiries is, that a monthly publication, of 16 quarto pages to each number, making 192 pages in a year, can be furnished in parcels of twenty or more, at twenty-five cents per annum. The postage to any place within the State will swell the cost to the subscriber to thirty seven and a half cents per annum. An amount so trivial, as to win indifference, and to silence the objections of avarice. I submit to you gentlemen, whether a more efficient mode of furthering one of the objects of our association,—the diffusion of useful knowledge—can be devised than the one here presented. Through the liberality of two public spirited and highly respected gentlemen, a specimen sheet of the proposed publication has been published, and has been submitted for public examination. Under the auspices of this Society the *CULTIVATOR* may be rendered a vehicle of useful knowledge, and a means of effecting great public good. I commend it to your guardian care.

In referring to agricultural associations, as a means of improvement, I think I shall be sustained by the opinion of those present, as well as by past experience, in the little I have to say. These associations tend to promote social and friendly intercourse, and an interchange of kind offices; to make our farmers emulous of excelling in their cattle, in their crops, their buildings, and in the neatness and order of their domestic arrangements; they bring them acquainted with each other's improvements and means of economizing labor; instruct them in the comparative value of breeds of animals, and the relative value of crops. They promote industry, frugality, and the love of knowledge. They tend to multiply our comforts, and

increase our wealth, by the laudable emulation they call into action, and to enlighten and embellish our country.

And yet I am sensible that these associations find but comparatively few ardent advocates among our farmers. Many are indifferent because they do not appreciate their benefits, or from an apathy common to our nature, in every measure which does not promise present gain. Some will not support them lest they should lose a day or a dollar. And others oppose them from an envious wish to deprive their neighbors of that public commendation which they are conscious they do not themselves deserve, and are not likely to obtain. The man who thinks and acts only for *self* regardless of the welfare of those around him, and who fancies that he rises because others sink, mistakes alike his interest and his duty, and is a stranger to those ennobling feelings which flow from disinterested acts of benevolence and philanthropy. If the comparison may be tolerated, I would liken the selfish man to the moon, whose sombre rays impart no vivifying influence upon terrestrial objects: and his contra to the sun, shedding abroad on every side his effulgent beams, and dispensing life, light and gladness to all around.

The remaining subject which I proposed to notice, is the awarding premiums for beneficial experiments and improvements in husbandry. I confess I am not satisfied of the utility of paying for the *largest* products, or the *fattest* animals, yet I believe there are many other subjects on which premiums may be awarded with public advantage. If my neighbors shall be induced by the expectation of a premium, to make some new application of science, or some new experiment in practical husbandry, which shall prove successful and lead to important public benefits, we become gainers, however expensive the investigation or the experiment may have been to him who obtains the premium. In this way great public improvements have accrued; and like means will produce like results. These rewards are often the exciting cause to active industry, philosophical research, and to the development of inventive genius; which like the seed, whose latent vitality is quickened into action by solar influence, grows, expands and matures into fruits of usefulness. Go to the American Institute at New York, and see the numerous productions which its premiums are eliciting from science and art. Look at Scotland, a country which is surpassed by none in recent improvements in husbandry, and where agricultural premiums have been awarded for fifty years, and see its society distributing nearly ten thousand dollars a year, as rewards for diligence and skill displayed in rural affairs. But I need not seek for illustrations abroad. They abound in every county in our state where premiums have been awarded. Upon this subject I quote again my highly respectable correspondent, who remarks in strong language—"I have no doubt that the money which was appropriated by the State to encourage agriculture, has increased the wealth of the county more than twenty per cent a year."

I have thus gone through with what I proposed to embrace in this address. I have pointed out some of the prominent defects in our husbandry, and have suggested means of remedying them at least in part. The means are partially at your command, and over them all you can exercise a salutary influence. I hope the present opportunity will not be suffered to pass without a united

* *Deck on the Improvement of Society by the diffusion of knowledge.*

and successful effort to advance the objects of public usefulness for which we have associated, and for which we have met on this occasion.

COMMUNICATIONS.

For the New England Farmer.

SOWING AND TRANSPLANTING.

MR. EDITOR, One of the principal causes of the failure of many seeds is the hardening of the surface of the ground by rains or watering, so that the young plant is unable to rise through the soil. Last spring it occurred to me that this might easily be prevented by the use of a little sand. I first covered my delicate flower seeds, &c. very slightly, or not at all, with the common earth of the garden, then strewed fine sand upon them, about an inch deep, and watered heavily and frequently upon the sand. I found it to entirely answer my expectations. Out of forty kinds of flower seeds I had lost very many every season.

Transplanting Implements. Several complicated transplanting instruments, consisting of several pieces, are described in the books, but I believe that one which I made and used last summer will be found to answer almost every purpose. It consists of a simple cylinder of tin plate equal throughout, the top edge being turned over so as not to cut the hand. They may be made of any size, but the best for ordinary purposes are about 8 or 10 inches high, and 4 or 5 in diameter. It is placed over the young plant about to be removed, and pushed down a few inches into the soil, nearly or quite to the bottom of the roots; it is then taken up, bringing the earth and plant with it. Being then carried to the place where it is wished to set the plant, and the hole being previously made to receive it, it is set in the hole, and a few strokes from the digger on the outside loosen it, and leaves the plant erect in its place, with all the earth in a circular mass about it, when the transplanter is removed. The ease and neatness with which the operation is performed is very striking. A plant may be kept in the transplanter for several days uninjured, and carried to almost any distance. I have sent to Mr. Barrett three transplanters of different sizes, which will perhaps explain themselves better than my description.

WILLIAM OAKES.

Ipswich, April 8, 1834.

BY THE EDITOR. Mr. Oakes has much obliged us, and we believe conferred a favor on practical cultivators by the above valuable communication. The Transplanters are received, and may be inspected at the Agricultural Warehouse, No. 52 North Market street.

MASS. HORTICULTURAL SOCIETY.

Saturday, April 12th, 1834.

The following letter was read to the Society.

GEN. DEARBORN, *Pres. of the Mass. Hor. Society:*

Dear Sir, More than a year since some seeds of the *Deodana*, which came to me from England were sent to the Horticultural Society, and to other persons, but as far as I have heard none of them came up. Through the kindness of Dr. Wallich I have just received others direct from Calcutta, by the Tuscany, of which Dr. W. says in a letter accompanying them "you will find perfectly fresh and good seeds of the *Deodana* or Himalayan Cedar, (*Pinus Deodana* Rex) one of the noblest trees in the world, fully equal in beauty and size to the cedar of Lebanon, and far exceeding it in the fra-

grance of its wood. I should imagine the trees would grow well in your Boston Climate." I take the liberty of sending you a few of these seeds, and have no doubt from their still fresh appearance that, if they should be committed to the care of the Society's intelligent gardener, most of them will grow.

I am respectfully your ob't servant,

JN. W. BOOTT.

At the meeting of the Society, held at their room on Saturday April 12th, 1834, the following business was transacted.

Voted. That the individuals chosen as a committee of Finance at a former meeting, shall constitute the same committee for the residue of the year.

Voted. That the thanks of this Society be presented to Captain Charles Sumner for his valuable donation of seeds.

Voted. That the thanks of the Society be presented to John W. Boott, Esq. for a donation of seeds, of the *Pinus deodana*, just received by him from Calcutta.

Voted. That the seeds be placed in the hands of the gardener at Mount Auburn.

J. T. Wheelwright elected a subscription member.—*adjourned.*

CHAS. M. HOVEY, Sec. pro tem.

FRUITS EXHIBITED.

Apples. Golden Russett, from the farm of Admiral Sir Isaac Coffin, Brighton, by the Messrs. Winships.

Pennock's Red Winter, from Mr. R. Manning, Salem.

Pome de Api or Lady Apple, from Mr. E. M. Richards, Dedham.

Malmsey Wine, made from the native grape, by Mr. J. F. Strut, Saugus, presented by Dr. S. A. Shurtleff, Boston.

Scions of the Dix Pear were presented by Mr. E. Bartlett, Roxbury, and distributed to the members.

For the Committee, B. V. FRENCH.

EXHIBITION OF FLOWERS.

By Thomas Mason, Charlestown Vineyard, *Pæonia moutan*, rosea; *Ixia crocata*; *Nerium splendens*; *Pittosporum tobira*; Tea and other roses, and fourteen varieties of *Geraniums*.

By order of the Committee,

JONA. WINSHIP, Chairman.

GRAFTING.

GRAFTING is a mode of propagating varieties of fruit of esteemed quality. Grafts may be cut at any time after the fall of the leaf in autumn, and before the buds begin to swell in spring. They should be of the preceding year's growth, are best from bearing trees and exterior limbs. They may be preserved by imbedding their larger ends in clay, a potato, or in moist earth in a cellar in winter, or in the open ground, partially or wholly covered in the spring. Grafts are annually sent across the Atlantic. The great care should be, that they are not kept too warm or too moist, so that the buds swell before they are wanted for use. The rationale of grafting will suggest the time and the manner in which it should be done. The scion and graft are to be so adjusted that the sap wood of the stock, by which the sap ascends from the roots, comes in contact with the sap wood of the scion; and a like adjustment must be observed between the inner bark of both through which the sap descends from the graft to the stock, after it has been elaborated in the leaves. With-

out the first precaution, the sap will not reach the graft, which will consequently shrivel and die. Without the last, the graft cannot knit or unite to the stock; for it is the descending sap which forms the new wood, and which indeed causes the graft to send its roots down into the earth, upon the outside of the wood, but under the bark of the stock. The union can only take place after the sap has begun to circulate in the stock which is when the buds are bursting. The clay or composition is applied to exclude the drying influence of the air, and sun, and also rain from the wound until a complete union has taken place. The graft does not become injured by being somewhat shrivelled before it is inserted; but if it appears too much so, it may be buried a few hours in moist earth before it is used. The compositions used as substitutes for clay are many. A good one is one part tallow, two parts beeswax, and four parts rosin, melted and incorporated like shoemaker's wax. If the weather is cold this will require to be softened by immersing it a time in warm water. A thin layer of this covering the end of the stock, and the slit will suffice. With the addition of a little more tallow, the composition may be spread upon linen or cotton cloth, when warm, and the cloth cut to the required size for a graft, and applied with less trouble in the form of a prepared plaster. The different processes of grafting are so generally known that we need not detail them; our object being only to throw out such suggestions as may tend to render the success of the operation more certain.—*Cultivator.*

REARING CALVES.

THE following is the general method of rearing calves in Britain, and differs not materially from that followed by Bakewell, the great cattle breeder.

"The calves sucked for a week or fortnight, according to their strength; new milk in a pail was then given a few meals; next new milk and skim-milk mixed, a few meals more; then skim-milk alone, or porridge made with milk, water, ground oats, &c. and sometimes oil cake, until cheese-making commenced, if it was a dairy farm; after which, whey porridge, or sweet whey, in the field, being careful to house them in the night, until the warm weather was confirmed. Bull calves, and high-bred heifers, however, were suffered to remain at the tile until they were six, nine, or perhaps twelve months old, letting them run with their dams, or more frequently less valuable cows or heifers."

It is to be remarked, that they have no Indian meal in Britain. This is substituted with us, for oatmeal, and even oil cake. A haudful put into skim-milk or whey, for calves, improves their condition greatly.—*Genesee Farmer.*

RATS IN JAMAICA.

IN no country is there a creature so destructive of property as the rat is in Jamaica; their ravages are inconceivable. One year with another, it is supposed that they destroy at least about a twentieth part of the sugar-canes throughout the island, amounting to little short of half a million of dollars currency per annum. The sugar-cane is their favorite food; but they also prey upon the Indian corn, on all the fruits that are accessible to them, and on many of the roots. Some idea will be formed of the immense swarms of these destructive animals that infest these islands, from the fact, that on a single plantation 38,000 were destroyed in one year.

BIRD KILLING.

The following notice to gunners and hunters, signed by nineteen individuals, appeared in a late number of the Germantown Telegraph.—*Far. & Mechan.*

"We, the subscribers, of Lower Merion township, Montgomery county, viewing with concern the astonishing increase of insects, and the immense damage done to our crops and fruit, for several years past, and believing the cause to be principally owing to the killing of birds, do most respectfully admonish all persons to abstain from shooting them or destroying their nests or eggs; and, for ourselves, we do absolutely forbid any person or persons trespassing on our places, breaking our fences, hunting or firing a gun on our respective lands, or with dogs of any species; therefore any persons entering on our premises, contrary to this notice, must expect to be dealt with according to law."

From the Genesee Farmer.

NEW MODE OF DESTROYING CATERPILLARS.

THE parent moth of the common caterpillar, lays its eggs on the small branches of our fruit trees, cementing them together with a gummy substance which preserves them from the weather. The deposit has often some resemblance to an open-ended thimble; but its form is not always regular, and sometimes it extends but little more than half round the twig. Our friend Charles Gifford of Ledyard, had observed that these are generally placed on the lower branches, and for several years, has been in the practice of picking them from his trees before the warmth of the season was sufficient to bring forth the young insects. The destruction of every deposit prevents the ravages of a nest of caterpillars. He is decidedly of opinion that it is the most expeditious and economical way of ridding an orchard of this nuisance; and we fully concur after having made a fair trial. The eye soon becomes practised in this search; and what at first seemed difficult to find, is readily detected.

This work may be done at any time previous to the opening of the buds. From an examination made on the 4th inst. with a microscope, we found the eggs already hatched, though the young animals keep in their cells; and there is no danger of their going forth till the leaves begin to expand. We estimate from a slight inspection, that the eggs will average about 300 to each deposit.

We have no recollection of having seen a nest of caterpillars in a pear. The cultivated cherry has a few; the peach suffers more, perhaps not less than the apple, or the crab; but the wild cherry is the great favorite.—We have seen the nests on one tree, united for more than ten feet in length.

It may therefore be proper to examine some trees more closely than others; and though we may care but little about the wild cherry, we must bear in mind that these insects, under the present arrangement of things, are our enemies; and that if we allow them to multiply, the more of them we shall have to war against, another year.—Some farmers who seem to believe there is no use in destroying insects, have had their orchards in a few years partially covered with nests; and we have seen some trees in the last season that had lost every leaf.

We think it is better to be up and doing. Should some of these deposits be overlooked which is not

unlikely to be the case, the orchardist may then resort to the common methods for destroying the few nests that may appear.

From the Maine Farmer.

RAISING WHEAT.

A PIECE of land lying in Dixfield village, owned and improved by Mr. C. T. Chase, after being improved as a pasture some years, was ploughed up three years ago last summer and sowed with rye, without manure and without grass seed. The crop of rye was rather small. The spring after the rye was taken off, the stumps were taken out, the land ploughed, and manured with about a dozen loads of leached ashes to one acre and one eighth of an acre. It was then sowed with wheat and clover seed. The produce was twenty-six bushels. The same fall after the wheat was taken off, the clover, which had taken well, was ploughed under, and the succeeding spring (which was the last) the land sowed with wheat, without any manure. The product of this sowing was forty and a half bushels, measured after it had been passed through the cleanser at the flour mill in the village. Mr. Chase thinks that the crop might have been injured from three to five bushels by cattle which broke in while the crop was growing. If we add three bushels, the smallest quantity mentioned, to the forty and a half bushels, we shall have forty-three and a half bushels of clean wheat from one and one-eighth acres. Deduct then from forty-three and one-half bushels, one-ninth part for the eighth of an acre, and you will have something over thirty-eight and a half bushels to the acre. Is not this doing well?

J. H. J.

Peru, March 17th, 1834.

CLOTHES CATCHING FIRE.

MANY affecting and fatal accidents have happened, and are frequently recurring, particularly to children, and females in the higher ranks of life, from their clothes catching fire, most of which might be prevented, were the two following simple facts universally known and practically applied,—that *flame has a tendency to mount upwards; and that air is essentially requisite for supporting it.* When the clothes of females take fire, as the fire generally begins at the lower parts of their dress, so long as they continue in an upright posture, the flames naturally ascending, and meeting with additional fuel as they rise, become more powerful in proportion; whereby the neck, the head, and other vital parts of the body are liable to be most injured; and, by running from one part of the room to another, or from one apartment to another, as is most frequently the case, the air, which is the fuel of fire, gains free access to every part of their apparel, and feeds the increasing flame. In such cases, the sufferer should instantly throw her clothes over her head, and roll or lie upon them, in order to prevent the ascent of the flames and the access of fresh air. When this cannot conveniently be effected, she may still avoid great agony, and save her life, by throwing herself at full length on the floor, and rolling herself thereon. Though this method may not, in every case completely extinguish the flame, it will to a certainty retard its progress, and prevent fatal injury to the vital parts. When assistance is at hand, the bystanders should immediately wrap a carpet, a hearth-rug, a great-coat, or a blanket around the head and body of the sufferer, who should be laid in a recumbent position, which will prove a cer-

tain preventive from danger. During the year 1813, the author noted down more than ten instances, recorded in the public prints, of females who were burnt to death by their clothes catching fire, all of which might have been prevented, had the simple expedients now stated been resorted to, and promptly applied.—*Dick on Diffusion of Knowledge.*

BITE OF MAD DOGS.

A NUMBER of dogs have been killed, both in town and in the country, within the last few weeks, which were believed to be in a rabid state; and on Thursday last an individual was bitten a short distance from the borough, by one supposed to be mad. As there is considerable alarm in the county, and probably some danger also, we copy the following from the *Press*—which was furnished by a physician—directing the course proper to be pursued in case of an individual being bitten, who is not able to procure the immediate attendance of a physician:

"Let the person bitten immediately tie a ligature very tight above the wound; then scarify the wound deep, after which bathe the wound with a strong solution of common table salt, very warm; suck the wound frequently with the mouth, there being no danger if it is often washed out with salt and water, or with a glass tumbler, which can be done by putting a little lighted paper in the tumbler and then applying it over the wound. After this, apply a large poultice of very hot mush, as warm as can be borne, and renew every half hour. Take off the tight ligature after the first application of sucking and bathing. Send for your Physician as soon as possible."—*Mercer Luminary.*

NEW PROCESS FOR CLEANING LINEN.

THE Society for the Encouragement of Arts and Manufactures have rewarded Mrs. Morris for a method of cleaning silk, woollen and cotton goods, without injury to the texture or color.—Take raw potatoes, and let them be well washed, and rubbed on a grater over a vessel of clean water to a fine pulp. Pass the liquid matter through a coarse sieve into another tub of clean water; let the mixture stand till the fine white particles of the potatoes are precipitated; then pour the mucilaginous liquor from the funnel, and preserve the liquor for use. The article to be cleansed should then be laid upon a linen cloth on a table, and sponged repeatedly with the potato liquor till the dirt is perfectly separated. The article should then be washed several times in clean water to remove the loose dirt, and may be afterwards smoothed and dried. The coarse pulp which does not pass the sieve is asserted to be of great use in cleansing worsted curtains, tapestry, carpets and other coarse goods. The mucilaginous liquor of the potatoes will clean silk, cotton or woollen goods of any kind, without damaging the texture of the article, or affecting the color. It is farther applicable to the removal of the dirt from oil paintings or soiled furniture; and the dirty painted wainscots may be cleansed by wetting a sponge in the liquor, then dipping it in a little fine clean sand, and rubbing the wainscot.—*London paper.*

Weight of live and dead Cattle. The proportion of live to dead weight, independent of offal is as 8 to 5.—This rule is found to be so correct that it would be far more satisfactory if cattle were sold by their live weight.—*N. Y. Farmer.*

ON THE PRESERVATION OF TREES GNAWED BY MICE.

Two years ago we had a Brown Beurre pear tree which stood in a snow-drift, and the mice gnawed off all the bark round it more than six inches in length. Some time in the Spring with a half inch chisel we cut three grooves, equidistant, extending from the bark above, downward, into the bark below, near the roots; and accurately fitted in three strips, which we took from the limb of another pear tree. All the strips grew fast at the upper ends, but only one at both ends. However it has saved the tree.

We tried a similar experiment on an apple tree many years ago which proved unsuccessful; but no grafting wax was then applied as it was in the other case. We are now satisfied however that our treatment of the pear tree might have been more skilful. The ends of the strips ought to reach within the bark both above and below, not less than an inch; and particular care should be taken that "the line of separation of the wood and the bark should in both stock and [strip] be accurately adjusted." We apprehend that owing to some neglect of this kind, the lower ends of the two strips were not united.—*Genesee Farmer.*

From the *Genesee Farmer.*
PEAS.

The farmers of Great Britain have ascertained, by many years' experience, that no other fallow crops leave the ground in a situation so favorable for a crop of wheat, as leguminous vegetables. At the head of this class may be ranked the pea. "To fallow, and at the same time, to have a shading and ameliorating mild crop growing on the fallow," is the system pursued by the best farmers of that country.

Lime in the soil is considered indispensable to produce this pulse in perfection; and where it does not exist in sufficient quantity, the application of gypsum will be found very beneficial. Nearly all our western lands contain a portion of calcareous matter, which is evidenced by the abundant crops of wheat. As far as my experience goes, no other crop so effectually subdues and pulverizes a heavy clay soil, as peas. On such soil, full ploughing is necessary. Early in the spring roll and harrow, then sow two and half to three bushels of peas per acre, and cover with the cultivator. When the crop comes off, the ground will be found remarkably mellow, and once ploughing will put it in fine condition to receive wheat.

By this management, I have raised 20 bushels per acre, and my wheat on the pea ground was the heaviest on my farm. In England it is not uncommon for a large farmer to have 50 acres of peas, and they find them the most valuable crop for several kinds of stock. Some farmers may say they cannot raise Indian corn in England, and are compelled to fatten their swine with peas. To such I would remark, that a bushel of peas is worth more than one of corn, to bring hogs forward early in the season, and is raised with half the labor. I begin to feed my hogs with peas as soon as they are too old for the table, and find that all is greedily devoured but the straw. I never had hogs to thrive so rapidly on any other kind of food. Corn is indispensable in the latter part of the season to give solidity to pork; but if we were to plant less corn, and sow more peas, we should be gainers by the change.

A celebrated writer on agriculture says, "A crop of peas is so far from exhausting the land, that it

may be considered as an excellent and ameliorating manure." Another writer says, "various crops pulverize the soil, and to a great extent prepare it for different crops. Peas for instance are peculiarly calculated for preparing the ground for wheat."

The pea bug (*Bruchus pisi*) punctures the pod when very young, and deposits an egg. Very few crops escape them, except such as are sowed after the 10th of 6 mo. (June.) It will therefore be best for every farmer to sow a part after that time for seed, or to keep a sufficient quantity over one year. The last method I have found effectual. If, however, the farmer cannot procure seed clear of bugs, let him heat water in a large kettle, and dip the basket containing the seed into the water when in a boiling state; keep them in not more than one minute, then throw them on a floor and strew on plaster.

I have sowed the small yellow pea, and the marrowfat, but if I could obtain them in sufficient quantity, I should much prefer *Bishop's new early dwarf prolific pea*, which I have found in my garden to be the most prolific variety. It seldom attains a height of more than twelve to fourteen inches, and is of fine flavor. When in blossom, they present a beautiful appearance.

ONTARIO.

From the *Proceedings of N. York State Agricultural Society.*
LETTER FROM EARL STIMSON TO J. BUEL.

Galway, 18th Dec. 1833.

Dear Sir, In reply to yours of the 23d November, requesting some information in regard to the difference between good and bad farming, I submit the following facts:

When the land was first cleared in this town, being about forty-five years since, its timber consisted principally of beech, maple, elm, ash and basswood. The soil produced good crops of all kinds; but the farmers neglecting to save and apply their manure, the consequence was that their crops decreased, and in about twenty-five years the land would not produce more than one half as much on an average as when it was first cleared, and this half cost them more labor than when they got double the quantity of grain or grass.

The land I now till, at first would not produce on an average more than fifteen or twenty bushels of corn, ten or fifteen bushels of wheat, barley or rye, and from half a ton to one ton of hay per acre. I commenced making, saving and applying my manure in the most economical way on the surface, and ploughing shallow; and in ten or twelve years I found I had brought it back to its original state of fertility. My practice has been to turn over the sod in the fall or spring, spread eight or ten tons of barn-yard manure on an acre, and then plant with corn; and to follow the corn with barley and grass seeds, putting three pounds clover and four of timothy seed on an acre; then let it lay two years to grass: then to go over with the same rotation of crops; and my third rotation was first wheat, second corn, third barley to seed down with, applying about the same quantity of manure every time I turned over the sod. In this way, in the course of twenty years, I got some of my fields to yield from eighty to one hundred bushels of corn, thirty-five to forty bushels of wheat, fifty to sixty bushels of barley, and from two and a half to three and a half tons of hay per acre, and with less labor, except in harvesting, than when I did not raise only about one-third or one-quarter as much. I know from my own ex-

perience, that it does not cost one-half, if more than one-third as much, to raise a bushel of grain by good husbandry, as it does by bad management.

The farmers have much improved their farms in this town since our State Agricultural Society was organized, and of course their crops have increased in proportion. *I have no doubt that the money which was appropriated by the State to encourage agriculture has increased the wealth of this county more than twenty per cent a year since*, yet there seems to be a want of enterprise with our farmers in promoting their true interests. The crops in this town were generally good the last season, except corn, which owing to the unusually wet and cold season, did not yield more than one-third or one-half a usual crop. I planted a field of four acres, which was in my highest state of cultivation. Occupied as a pasture I turned over the sod about the first of July, and planted it two feet eight inches apart, with eight rowed yellow corn. When the stalks were fit to cut I had the curiosity to ascertain the weight of the corn and stalks on an acre, and found that I had 33,000 lbs. and 26,000 ears of corn. This was the heaviest growth I think, that I ever raised and I have no doubt that there were 150 to 160 bushels of corn when fit to crib.

Respectfully, yours, EARL STIMSON.

TO RENDER LEATHER, &c. WATER PROOF.

TAKE 100 lbs. of the best linseed oil; add $1\frac{1}{2}$ lbs. acetate of lead, $1\frac{1}{2}$ lbs. of calcined amber, $1\frac{1}{2}$ lbs. white lead and $1\frac{1}{2}$ lbs. very fine powdered pumice stone, well ground and mixed together—must be boiled in the oil for ten hours, over a moderate fire to prevent the oil from burning. This varnish should be of such a consistence that, when mixed with a third part of its weight of pipe clay it will be as thick as treacle. It is left to settle eight days, and is then passed through a lawn sieve. The next process is to grind, in a solution of strong glue, as much pipe clay as amounts in weight to a tenth part of the oil employed, and to mix it to the consistence of ointment; adding the varnish by degrees and stirring it well with a wooden spatula or stick. This varnish must be repeatedly stirred, till it become perfectly fluid; and then the desired tint is given by adding a fourth part of the color, ground in oil.

The linen must be stretched upon a wooden frame; and the composition applied upon it with a large spatula, 3 inches broad and 9 inches long. The frame is then inverted, and the operation repeated upon the other side of the cloth: It is then left to dry for a week, and separated from the frame for use.—This cloth may be used for covers for carriages, &c.

For leather and skins, the same composition is used, but to give to the surface a smooth and brilliant appearance, the following varnish is employed. Take 5 lbs. oil of varnish, and an equal weight of well clarified resin; boil them together until the resin is dissolved; then add 2 lbs. oil of turpentine, having the color to be given to the varnish ground in it, and passed through a lawn sieve. This varnish to be applied with a brush. When the varnish is thoroughly dry, it must be rubbed even with a pumice stone and water, and then washed clean. Two or three coats being applied, and each suffered to dry two or three days, produces a brilliancy equal to that of Japan lacker.—*French paper.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, APRIL 16, 1834.

SPRING WORK.

SEE that your sheep are freed from ticks. A correspondent gives the following directions for effecting this object.

"Boil a small quantity of tobacco, perhaps what grows on one good thrifty stalk would be enough for half a dozen sheep, in so much water, as when it is sufficiently boiled, there shall be two or three gallons of the liquor; let it become sufficiently cool, then open the wool along the centre of the neck and back of the sheep, and with a bunch of tow or some other spongy substance put on the decoction until the skin becomes thoroughly moistened therewith, and in a short time the ticks will all be destroyed, and the sheep instead of pulling out and wasting their wool by fruitless exertions of self defence, will become easy and contented, and suffer their fleece to remain to be taken off by the shears.

"For many years I have taken this method with my sheep, just before the time of their lambing, and have always found it to have the desired effect. I very much dislike the foolish practices of smoking, chewing and snuffing the poisonous weed, at least when no better reason can be given for so doing than fashion or the force of habit; yet I annually raise a few plants for the benefit of my sheep, and would recommend to every one who keeps these useful animals to do the same."

We approve of the practice of our correspondent in cultivating a little tobacco for the purpose of extirpating sheep-ticks. It is likewise well to use decoctions of this plant for destroying lice on cabbage plants, insects on fruit trees, &c. It has been recommended to use the powder or dust of tobacco to save young plants from insects. While the dew is on the ground the dust of tobacco is thrown over the beds where the plants are just coming up. Likewise a liquid expressed from this plant may be obtained of tobaccoists, which is cheap, and highly destructive to animal life. Mix this liquid with from three to five times its quantity of water, and with a syringe or watering pot you may rid your premises of canker worms, caterpillars, turnip flies, and other plagues of the kind in a cheap and efficacious manner.

If you cannot conveniently obtain this essence of destruction from some neighboring tobaccoist, you may pour boiling water on the leaves or even the stems of tobacco, and when the decoction is cold apply it as aforesaid to such creeping and crawling animalcules as it may be desirable to doctor into non-entity.

Ewes and Lambs. The *Farmer's Manual* asserts that the best nursing for feeble lambs is to keep the ewes well, and recommends giving them not only potatoes and carrots but white beans in small quantities, so as not to excite fever. If your lambs are feeble they will require to be nursed with warm milk, given frequently in small quantities. Ewes milk is best, and if the ewe does not give milk enough for her lamb there is little probability that the lamb will live. Therefore, as before asserted, you should attend to the diet of the mother for the purpose of giving health to her offspring. If you are apprehensive lest foxes should take unwarrantable liberties with your lambs and geese, you will rub a little tar on their necks, and it is said neither foxes nor wolves will attack them, as those marauders cannot endure the odor of tar.

Culture of Onions. The following mode of cultivating onions is extracted from a communication for the *New England Farmer*, printed vol. 3, p. 265, and written by J. TUCKER, Esq. of Salem, Mass. We reprint the directions because they appear to us useful, differing in some respects from any others which we have observed, and will be as good as new to many of our readers.

"The land should be ploughed about four inches in depth, and harrowed so as to make it very fine; the manure which should always be a rich compost, should be ploughed in and thoroughly mixed; the land should then be rolled with a heavy roller to form a close bottom for the bulbs to form upon, and at the same time not so hard as to prevent the plant from penetrating. The best onions, and the largest crops are produced where the bulbs grow almost entirely on the top of the ground. After the ground has been rolled and before the seeds are sown, the beds should be raked with a sharp iron rake, to prepare a finely pulverised drill for the reception of the seed; and after the seeds are sown, the drill should be pressed with a board and sufficient weight to bring the earth in close contact with the seed. Care should be taken in the selection of the seed; none should be sown but what will be sure to vegetate, and it would be well if no more seed was sown than you would have plants to grow and remain in the drill. It will be superfluous to add that if you would have a good crop of onions, you must not permit a crop of weeds to grow in the same bed, they will not do well together."

The best manures for onions are said to be sea weed and charcoal dust. The sea weed should be buried with a spade or plough like any other coarse manure. The charcoal dust spread upon the top of the ground intended for onions about a half an inch thick, before the seed is sown, (the ground being previously well dug and manured) and dug in with the point of the spade, so as to mix the top soil and charcoal dust together.

Mr. Joseph Perkins of Newbury, Mass. in the year 1832 received a premium of twenty dollars from the Mass. Agricultural Society for a crop of onions, amounting to 646 1-2 bushels to the acre, reckoning 52 1-2 lbs. to the bushel. The following as stated by Mr. Perkins was the mode of culture by which this great crop was obtained.

"The quality of the soil varies from a light yellow to a dark loam, and has been cultivated with onions for several years. The 20th of November last, there were four loads of barn manure ploughed in, in ridges. The 28th of April following, the land was ploughed and harrowed, and three pounds of seed sown in drills fourteen inches apart. The first hoeing and weeding was done June 10th, which cost six days' labor. The last weeding was done July 7th, which cost six days more. They were harvested the last of October, and nine thousand and seven hundred bunches have been bunched; which estimating 15 bunches to the bushel, each bunch weighing 3 1-2 lbs. is six hundred and forty six and a half bushels."

New Mode of selecting Seed Corn. Mr. Solomon Thayer of New Braintree Mass. has left in the office of the N. E. Farmer, several ears of Indian corn, which are remarkable for a property in which common corn are often deficient. The small ends of the ear is filled completely out, quite to the extremity with sound kernels of good size, instead of an inch or two, more or less of small imperfect kernels, or barren cob, as is often the

case, in the product of our corn fields. This was effected by Mr. Thayer, by selecting for seed for several years in succession, kernels which grew at the tip of the ear; and as like not only produces its like but improves its likeness, these top end kernels being planted produced two or three more ears to a stalk, which were filled and the ends rounded off with sound corn of larger size than top end kernels usually are.

We doubt however, whether these ears are as large as if the largest kernels had been planted. Some cultivators think they have derived advantage by selecting their seed corn exclusively from the largest end of the ear. They tell us that "the nearer the seed is taken from the butt-end the larger will be the ears." Perhaps Mr. Thayer might improve on his praise-worthy experiment by selecting seed corn for two or three years from the large end of his improved ears; and then plant a while from the middle. Dr. Deane directed in shelling seed corn, to select about an inch from each end of the corn, planting the middle only. But experiments are of more weight than authority in the scale of improvement.

ANOTHER TRANSPLANTER.

We have in this day's paper, (page 315,) taken notice of Mr. Oakes' transplanters, for which he deserves well of cultivators. Since that notice we have been introduced to another implement for the same purpose, invented by a Mr. Smith, and which is for sale at the Boston Agricultural Warehouse. This machine is so fitted with a moveable slanting side that the communication between the plant and the earth in which it grew, except a portion of soil attached to the roots, is cut off at the bottom as well as the sides, by which means on withdrawing the implement, the extraction of the plant, and a quantity of attached soil in which it grew is rendered certain.

HOUSE BELLS.

Communication. I wish through the medium of the *Centinel* and *Palladium*, to notice a neat and economical improvement made by Mr. CURRIER, of this city, respecting bells for houses and hotels. Heretofore there have been separate bells for each apartment. These have been numbered to indicate the apartment where an attendant was wanted. In large establishments numerous bells are necessary, and these were costly, and sometimes not useful if the bell had ceased to sound before it was looked at. In the invention a single bell is sufficient for the largest hotel. The wire from each apartment, while it rings this common bell, communicates motion to a suspended ball over an appropriate number, and its long continued vibrations give, without fail, and without noise, the information that is desired. The expense is comparatively trifling.—*Boston Centinel*.

The above mentioned ingenious and useful contrivance may be seen at the Boston Agricultural Warehouse, No. 52 North Market street.

ITEMS OF INTELLIGENCE.

Salt. At no period since the commencement of the salt-manufacture in this county was that interest more depressed than at the present time. Salt works are unsaleable at any price much above the inconsiderable value of the materials of which they are composed for other purposes. Salt is very low. Sales have been made at 31 and 32 cents per bushel, and there is little prospect for an improvement at present.—*Barnstable Journal*.

Fraud in Packing Hay. A gentleman desires us to notice a fraud which he discovered a day or two ago, in a bundle of Northern Hay, in the centre of which he found about 20 lbs. of worthless trash. We hope the time is at hand when we shall no longer be obliged to import from such a distance, large quantities of an article which ought always to have been produced in abundance in an agricultural state like this. There have been between 500 and 1000 bundles of Northern Hay, worth about \$5 per bundle, consumed in this place within three months past.—*Fayetteville N. C. Observer.*

Something new. A letter commencing as follows, was lately published in the Washington Globe. The idea of evincing a spirit of gratitude by *getting drunk on the Sabbath*, is indeed original.—*Merc. Jour.*

"NEW YORK, 6th March, 1834.

"Dear Sir, I received your short but gratifying letter this morning stating the result of the debate on the resolutions of the Committee of Ways and Means. *Laus Deo!* I intend to get tipsy to day though it is Sunday."!!!

CHEAP DAHLIAS, CHINESE MULBERRIES, &c.

WM. PRINCE & SONS, near New York, having greatly increased about 350 of their splendid varieties of Dahlias, now offer them at the following *very reduced prices*, and they are ready to supply five thousand immediately.—

Double Dahlias, 12 distinct named varieties, comprising such sorts as have been most increased, for \$3.
Double ditto, 12 distinct varieties, comprising such sorts as are still more rare and beautiful, \$4.
Double ditto, 12 distinct varieties, comprising such kinds as are yet more rare and remarkably beautiful, \$6.

In addition to the splendid collection which the last season composed their famous *acre bed*, they have just received from Europe, every new variety of great celebrity, and the Amateurs may now have their utmost wishes gratified at reasonable prices to accord with the times. Levick's Incomparable, scarlet petals tipped with white, now offered at \$2½.

Chinese Mulberry or Morus multicaulis, on their own bottom, and not grafted, at \$25 per 100—or \$4½ per dozen.
Just imported 25 bushels New Italian Rye Grass; 50 bushels Pacey's perennial do; 1200 lbs. Finest Provence Luzerne, 100 bushels Potato Oats, weighing 4½ lbs. per bushel, and a great variety of other Seeds.

The Chinese Paeonies now reduced to following rates—Double White, or Whitley's \$1; Humei \$1; Fragrans \$1; the Tree Paeony \$2½; Papaveracea \$4, and other varieties 25 per cent discount.

200 bushels Orchard Grass at \$2½, and 80 bushels Tall Meadow Oats Grass at \$2½; 150 lbs. Trifolium incarnatum, a new very early clover, at 40 cents.

Linnaean Botanic Garden and Nurseries. 2t ap 16

GRAPE VINES, DAHLIAS, &c.

For Sale by HOVEY & CO, No 79 and 81 Cornhill, (late Market street.) Isabella, Catawba, Pond's Seedling, (a superior, new, native variety,) and choice foreign kinds of Grape vines, by the single one or hundred, well packed for transportation to any part of the country.

A fine assortment of English Gooseberry bushes, of the best kinds, including those that obtained the premium of the Mass. Hort. Society.

—ALSO—
A collection of the best double Dahlias, Bulbous Flower Roots, Greenhouse Plants, Hardy Perennial Flowering Shrubs, Honeysuckles, &c. &c. a 9

PRIZE DAHLIAS.

FOR SALE, 200 varieties of the best double Dahlias. This collection of Dahlias obtained the premium awarded by the Mass. Hort. Society the two last years.

Orders left with Messrs. HOVEY & CO. No. 79 & 81 Cornhill, Boston, or C. F. PUTNAM, Salem, will be duly attended to. apr 2

GRAPE VINES AND EARLY POTATOES.

Catawba and Isabella Grape Vines, extra large size, by the hundred or single.

Early Potatoes which obtained the premium for the last five years. For sale by SAMUEL POND. Cambridgeport, Feb. 25.

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table mats. 1st. a 16.

SWEET POTATO SLIPS.

THIS day received from New Jersey, a quantity of SWEET POTATO SLIPS in fine order, and will be sold in large or small quantities if applied for soon. GEO. C. BARRETT, New England Seed Store. ap 16

WHITE DUTCH CLOVER.

RECEIVED this week direct from Holland 1000 lbs. superior White CLOVER, warranted free from any kind of foul seed, and at least worth one third more than American. This will be found an excellent Grass for Pasture land, &c. a16 GEO. C. BARRETT, New England Seed Store.

MANGEL WURTZEL SEED.

300 lbs. Mangel Wurtzel Seed, raised from selected roots and not imported. This article cannot be too highly recommended for Stock, yielding 40 tons to the acre, and being a most profitable crop. Sow 2½ lbs. to the acre. For sale at New England Seed Store. GEO. C. BARRETT.

For Sale at the Agricultural Warehouse,
—WILLIS' Improved Cast Steel MANURE FORK, the best warranted article that has been made for the purpose. a16

For Sale at the Agricultural Warehouse,
—HARDEN'S improved SEED SOWING MACHINE. This is one of the best labor saving machines in use, calculated for sowing small seed. The saving of seed in the use of this implement is more than sufficient to pay the cost of it annually. Price \$5. ap 16

Howard's Improved Patent Cast Iron Plough.

FOR SALE at the Agricultural Warehouse 51 & 52 North Market street, a further supply of Howard's Improved Patent Cast Iron Ploughs. The very extensive sale these ploughs met with the past season, and the very general satisfaction they gave to all persons who used them, give them decidedly the preference over all ploughs now in use—a constant supply of them will now be kept for the accommodation of the public, and all orders will be supplied on the same terms as at the manufactory. a 16

GRAPE VINES AND PEAR TREES.

FOR SALE, a few Grape Vines, plants 3 years old, at the Garden of S. G. PERKINS, Brookline, viz.—

White Chasselas or Muscadine, Purple Muscat,
Red Chasselas, Red Constantine,
Black Hambourg.

Also, a few Pear Trees.—Dwarf, Duchess of Angouleme. Apply at the Garden to Mr. ROBERTS, or to Mr. PERKINS at his Office. ap 16

MACHINE FOR CUTTING FODDER.

THE simplicity of the construction of this Machine, and the small probability of its getting out of repair, together with the neat and rapid manner that it performs its work, certainly renders it a desirable article for the purposes for which it is intended. It is constructed on an entire new principle from any heretofore invented, and will cut an hundred weight of hay in ten minutes, two inches long, can also cut any length from three inches to one-fourth of an inch; it is fed by placing the fodder in a hopper that stands perpendicular, the knife playing horizontally underneath, by which means all the complicated machinery for feeding and the power necessary to drive it is avoided.

The Subscriber having become the proprietor of the right of making, &c. said machine, in and for the State of Massachusetts, solicits the public to call and examine for themselves. Said Machine is for sale at the store of PROUTY & MEARS, No. 12 Commercial street, Boston. DAVID P. KING, Who is also Agent for the States of Vermont, New Hampshire, Maine, and Rhode Island. a 2. cow6w

THIS IS TO GIVE NOTICE

THAT the Season has arrived for Transplanting FRUIT and ORNAMENTAL TREES, VINES, &c. Those wanting an excellent collection will please call at the New England Farmer Office, and leave their orders, which at one day's notice will be attended to.

GARDEN, FLOWER, and GRASS SEEDS, the best collection ever offered in this market, and orders promptly attended to. GEO. C. BARRETT.

BRIGHTON MARKET.—MONDAY, April 14th, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 312 Beef Cattle, (about 30 unsold) 26 ps working Oxen, 15 cows and calves, 140 sheep, and 960 swine.

PRICES. Beef Cattle—Sales were not so good as they were last week; would average about the same as they did 2 weeks since. We noticed quite a number taken at 5 75 all very fine, we quote prime at 5 25 a 5 50, good at 5 a 5 25, thin 4 50 a 5.

Working Oxen—Sales were effected at \$45, 60, 75, and 80. Cows and Calves—We noticed sales at \$20, 23, 27, 29, 30, and 35.

Sheep—Lots were sold at \$4, one at 5, and few very fine at 10.

Swine—Several lots were taken at 5c for sows, and 6 for barrows, and one at 5½ and 6½. Some large barrows were sold at 5c: 3 lots selected at 5c, at retail, 6 for sows and 7 for barrows.

SPRING RYE.

JUST received a quantity of Spring Rye, at New England Seed Store.

MISCELLANY.

From the Detroit Courier.

NEW ENGLAND.

THE hills of New England—
How proudly they rise,
In the wildness of grandeur
To blend with the skies!
With their far azure outline,
And tall ancient trees;—
New England, my country,
I love thee for these!

The vales of New England
That cradle her streams;
That smile in their greenness
Like land in our dreams;
All sunny with pleasure,
Embosomed in ease,—
New England, my country,
I love thee for these!

The woods of New England—
Still verdant and high,
Though rocked by the tempests
Of ages gone by:
Romance dims their arches
And speaks in the breeze,—
New England, my country,
I love thee for these!

The streams of New England,
That roar as they go;
Or seem in their stillness
But dreaming to flow:
O bright gilds the sunbeam
Their march to the seas,—
New England, my country,
I love thee for these!

The homes of New England,
Free, fortunate and fair;
O many a heart treasures
Its teraphim there!
E'en more than thy mountains
Or streamlets, they please,—
New England, my country,
I love thee for these!

God shield thee, New England,
Dear land of my birth!
And thy children that wander
Afar o'er the earth:
Thou'rt my country, wherever
My lot shall be cast,—
Take thou to thy bosom
My ashes, at last!

Williams College, Feb. 5, 1834.

IRON.

In few instances do we perceive the concern of Providence for the wants of mortals more fully exemplified, than in the abundant distribution of this substance over the face of the earth, not only in a metallic state, but also in an infinite variety of combinations: from which source are derived many articles of almost indispensable use in our arts and manufactures, as plumbago, commonly called black lead, (a combination of iron with charcoal,) Prussian blue, green vitriol, &c.; but at present we must only take into consideration the simple metal.

Iron is seldom found in a pure metallic state; but its ores are diffused throughout nature in greater abundance than those of other metals, oftentimes combined with them, and sometimes in the states of an oxide, i. e. rust. In this state occurs the Swedish iron ore, which produces such excellent metal. In order to reduce the ore into cast-iron, in some manufactories, it is broken into small pieces, and mixed with lime, or some substance capable of promoting its fusion. It is then thrown into the furnace, together with a quantity of coke or charcoal; where, after being submitted for some time to a most intense heat, the reduced metal descends through the fuel, and collects at the bottom, whence it is let out, and forms pigs of

cast-iron. In this state it is employed in the fabrications of various kinds of machinery and utensils.

Cast-iron acquires carbon from the charcoal or coke used in its reduction, and originally contains oxygen and other adventitious substances, which cause its brittleness and render it fusible, though with some difficulty. In order to deprive it of these, it is kept in a state of fusion for a considerable time, and repeatedly stirred; during which process, the carbon and oxygen uniting, pass on in the state of carbonic-acid gas or fixed air. At length, having become thick, it is taken from the furnace, and submitted to the action of the hammer, or the regular pressure of large steel rollers, by which the remaining impurities are forced out, and the metal is rendered malleable, ductile, and nearly infusible. Iron in this state is called bar or wrought iron.

Iron, by the above process, being divested of charcoal, must again absorb a small portion of pure carbon, in order to be converted into steel. This is effected by submitting good iron to an intense heat, for several hours, in conjunction with carbonaceous matter, such as charcoal, carbonate of lime, &c. Good steel contains about one part of carbon in two hundred of iron.

It may be remarked, that, of the metals in common use, (platinum excepted) iron alone possesses the property of welding. Innumerable are the advantages which we derive from this peculiar quality, by which, without fusion, merely by heating, iron is moulded into the variety of forms, in which it is every where exhibited to our view. Iron possesses likewise the property of being attracted by the magnet, and of becoming itself magnetic. To this property we are indebted for the mariner's compass—an instrument, by which man is enabled to steer his course towards any part of the globe, with the greatest accuracy and certainty.

Contrary to the prejudiced opinion of the ancients, who supposed that iron was poisonous, and that wounds, inflicted with instruments made of this metal, healed with difficulty, it seems that its effects on the animal economy are very beneficial, both in medicinal preparations, and in its state of natural solution in chalybeate waters. Indeed, of all metals, this is the most important; since there is no other, wherein are contained, at the same time, so many useful properties; none which can be applied to such a variety of uses; and, finally, none which exists in such abundance, or in so many different states, for it pervades all nature, is found in vegetables, and even in animal fluids.

It may not be improper to state here, that the article, known in commerce by the name of *tinned plate*, is not tin, as some suppose, but iron plates, which having undergone certain chemical preparations, are immersed in melted tin, which not only adheres to the surface, but even partly penetrates the plate, and gives it a very brilliant appearance.

MOOSE.

A moose is being exhibited in Portland—which was taken seven or eight months ago at the head water of the Androscoggin by an Indian when but two or three weeks old. The Portland Courier says, "he is about the size of a colt, a year old; as tame and gentle as a house dog; eats hay and potatoes like a horse; and will kneel at the bidding of his keeper to pick up his food from the floor, his legs being so long and neck so short as to render this position necessary to enable him to reach the floor."—*Berkshire Advocate*.

TO MY NOSE.

Knows he, that never took a pinch,
Nosey! the pleasure thence which flows!
Knows he the titillating joy
Which my Nose knows?

O Nose! I am as proud of thee
As any mountain of its snows!
I gaze on thee and feel that pride
A Roman knows!

REDUCTION IN PRICES OF TREES, &c.

WM. PRINCE & SONS have determined in consequence of the pecuniary pressure, to reduce the prices of a great variety of Trees and Plants, where orders are sent for a considerable amount: and all persons who desire Fruit and Ornamental Trees; Flowering Shrubs and Plants; Greenhouse Trees and Plants; Splendid Dahlias; or Seeds—will on applying to them direct by mail, with a list of the articles wanted, be promptly furnished with a printed sheet explaining the reduced rates.—The Chinese Mulberry, or Morus multicaulis are now reduced to \$25 per 100, and \$41 per dozen.—Apple trees in great variety \$20 to \$5 per 100.—Pears \$37½ per 100, and extra large ditto 50 cents each; and 50,000 are two, three, and four years grafted.—Peaches \$20 and 25 per 100.—Large Orange Quinces \$30 per 100.—English and Spanish Filberts \$25 per 100.—Fine Red Raspberries \$6 per 100.—Large Red and Yellow Antwerp \$16 per 100.—Gooseberries, finest Lancashire varieties \$30 per 100; and Large Red White and Black English Currants \$16 per 100.—Isabella Grape, 3 years old vines \$25 per 100, and 2 years ditto \$20 per 100.—Catawba, Alexander, Winne, York Claret, York Madera, and Scuppernon, \$25 per 100.—Herbmont's Madeira, Troy and Elsingburgh, \$30 per 100.—Norton's Virginia Seedling \$35 per 100.—The collection of choice European Grapes is unrivalled.—Chinese Ailanthus, 4 feet high, \$1½ per dozen and larger sizes in proportion.—A reduction is made on a great many kinds of Roses, Paeonies, Chrysanthemums, &c.—Double Dahlias of such fine assorted kinds as have been most increased, will be supplied at \$3, \$4, and \$6 per dozen, according to excellence, and selected by ourselves. The roots can be sent to any distance.—The new varieties of Flemish and English Pears having been introduced by us and greatly increased, the prices of the greater part have been reduced, and the trees are mostly of fine size and three years ingrafted.—The Ornamental Trees and Shrubs of most kinds are large and thrifty, and of double or treble the value of smaller ones, which is a most decided advantage, being a gain of several years in embellishment.

N. B. Having no Agent at Boston, the Commission of 10 per cent. usually allowed for Agency, will be credited to the purchasers, and be deducted from the amount of the bills rendered. The stock of Dahlias being so very large, they will be furnished on the most favorable terms possible. Linnæan Botanic Garden and Nurseries, {
Flushing, near New-York, Feb. 10, 1834. }

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

1 Case wet (but not damaged) Bishops Lawn.
1 do. do. Book Muslin.
Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation.
March 14, 1834.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[] No paper will be sent to a distance without payment being made in advance.

VOL. XII.

BOSTON, WEDNESDAY EVENING, APRIL 23, 1834.

NO. 41.

WE are indebted to an esteemed friend for the following address, which we are happy to give a place in our columns. We perfectly coincide in opinion with the gentleman to whom we are indebted for this valuable article that "it is a sensible well written Address by a practical and observing man."

AN ADDRESS TO THE ESSEX COUNTY AGRICULTURAL SOCIETY;

At New Rowley, September 26th, 1833, at their ANNUAL CATTLE SHOW.

BY JEREMIAH SPOFFORD.

GENTLEMEN, I consider myself happy in the class of my fellow citizens that I am this day called upon to address. The character and pursuits of a New-England farmer, have always held an honorable place in my estimation. It was among them, and in their employment, that I spent those years of happy childhood, when every thing makes its deepest impressions. My earliest ideas of property, were derived from their possessions. To me houses and farms and cattle were wealth, and their owners nature's nobility. While money and notes, stocks and merchandize, appeared fleeting and transient—there seemed something in the possession of *solid acres*, especially when these were *compact farms*, with their venerable mansions, descending from generation to generation, that elevated the possessor, and gave a dignity and character to his pursuits truly honorable and desirable.

Nor have these been merely the illusions of youth: they have followed me, and I have cherished them in my riper years.—And I view with gratitude that kind Providence, which cast my youth among that class of society. The labors of the field gave a value to my scanty library, and my few hours of study, of which, under almost any other circumstances I could have had no conception: and memory still loves to "hover o'er" those inestimable *Sabbaths*, when, after six days labor done, we found a day of *rest*, and assembled within these very walls, to enjoy it in social solemn worship; nor can any one know the value of those *Sabbaths*, unless it be those who spend the week in patient labor, and assemble on the seventh as a sacred holiday, to greet the countenances of their friends, and pay their devotions to the most high God. Here then we met few except cultivators of the soil, prepared by their labors in the field to render their tribute of gratitude to Him who gives rain from heaven, and fruitful seasons, filling their hearts with food and gladness. Venerable fathers! who then bowed in this sacred temple! may your sons as patiently cultivate the soil you then possessed, and as devoutly worship here.

You will forgive this digression, when you look around the world, and see how closely connected are Christian morality and Agricultural prosperity, —and you will as soon expect to gather grapes from thorns, or figs from thistles, as to find a well cultivated farm under the superintendence of him who neither fears God, nor regards man.

Writers in all ages have been lavish in their praises of the important pursuits of the husbandman. The flowery *fields*, the bleating *herds*, the rural *cottage*, and the domestic *fireside*, have furnished poets and orators with their brightest images. But while they have thus been lavish of

their panegyrics, few of them have descended from their elevations to cleave the sod, and nourish the plants, which produce all these beautiful images. But at the present day nothing is more common, than for men to quit our halls of legislation, our courts of justice, ships and merchandize, or the learned professions, to seek in agricultural pursuits for that tranquil enjoyment, that health of body and peace of mind, which they had sought in vain among the objects of towering ambition, the eager pursuits of wealth, and the jarring interests of a busy world. Thirty years ago Cincinnatus had many admirers, but very few imitators; but now the Cincinnati of America may be found in every part of our land, and men whose names are well known to the politicians and literati of our country, may frequently be found aiding in the labors of the field. Their plans, and their pens, and their instruments of labor, co-operate in the same wise and benevolent design—to multiply the fruits of the earth, the great mine of real wealth, and store-house of sustenance for man and beast.

That kind of fictitious consequence, which struts in ruffles and gloves, is fairly out of fashion. This may be styled the age of *utility*; and that man, as well as that machine, that is of no use, is very little valued; and the person who should in this age and nation, wear appendages or ornaments to show that he did nothing, would at the same time, in the estimation of an immense majority, be making himself ridiculous, and showing himself worth nothing. Riches to any amount now give no exemption from this universal law; but on the other hand, if a man has capital, he is considered under increased obligation to attend to business, and he is hardly excused when he provides business enough to ensure the industry of himself and household, but he is looked to for the plans and the capital which is to employ the hands, and furnish subsistence for his whole village or neighborhood.

This is among the most important improvements of the present age, and it has had a most salutary effect upon agriculture, that so many men of talent, property and education, have chosen this as the object of their pursuit, and the sphere of their industry. To the young and ambitious, the tiresome labor and the slow acquirements of the farmer, have often appeared repulsive; they have sought out some readier source of wealth, or what they might have considered a more genteel employment. They have often turned their backs upon advantageous settlements, and birthrights of inestimable value, to seek in distant lands, or foreign climes, for sources of gain and scenes of excitement and novelty. In a small proportion of instances these hopes have been realized; but in innumerable others, they have ended in sorrow, vexation and disappointment, and thousands of sighs of bitter anguish have risen from the bosom of the broad ocean, or echoed from foreign shores, when memory cast a "longing lingering look" over the pleasant hills and fruitful fields of New England.

The learned professions, merchandize, and manufactures, when selected by congenial minds, may have been wisely chosen, and in many instances have led to happy results; but how many, even of those who have succeeded well in their plans,

while enduring their tremendous responsibilities their anxious cares, and their ruinous risks, have envied the farmer, who free from those cares is tranquil by day, and finds repose and refreshment at night, in sound oblivious sleep; and who, independent of the breath of popularity, or the fortune of trade, depends for prosperity only on himself and heaven.

Agriculture at the present day, instead of being a mean, servile employment, is now justly ranked as an important science; and the studies of the learned are now often directed to the most laudable employment of multiplying the fruits of the earth, and improving the quality of the fruits produced.

Chemistry no longer examines the material world in search of fictitious wealth. Philosophers have become convinced that in transmuting the simple elements into grain and fruit, fit for the nourishment of men and animals, they perform a much more useful service than they would have done had they succeeded in transmuting iron into gold, or lead into silver.

The long sought art of transmuting metals, though it might enrich the discoverer, would now be considered of questionable utility. The art of multiplying the fruits of the earth, has already spread the most solid comfort over this and other lands: and nearly banished want and famine from the civilized world; and yet so far is that art from having reached its maximum, that even in this State, though more thickly inhabited than any other portion of this Union, no doubt can reasonably remain but that three times its present inhabitants might be sustained on our own soil.

When our soil shall be thoroughly analyzed, and every acre applied to its appropriate use, and when the increase of population, or a diminished supply from abroad, shall turn our attention to our own resources, our now naked plains will be loaded with luxuriant vegetation, and our hills shall wave with the golden harvest.

Even the vast extension of manufactures which already strains the Merrimack through flumes and wheels, and threatens even to turn Niagara to a mill seat, but furnishes a home market, and increases the necessity and the reward of agricultural industry; and the time is at hand when railroads shall traverse our mountain valleys, and every article shall be trundled with ease and velocity from the place of supply to the place of consumption.

In pursuing the subject I propose

First—to examine the advantages we enjoy, in this country, as an agricultural community: and compare them with advantages in other parts of the country.

Secondly—to notice some of the most essential circumstances which contribute to develop and improve these advantages.

As to the advantages we enjoy it is highly desirable that we form a correct estimate. Truth is always desirable, and this is peculiarly so, when it enables us to place a proper value upon our own property; and prevents our envying others the enjoyment of theirs, when perhaps our own is most valuable.

Such has been the rage for western emigration, for the last twenty years, that the soil of New Eng-

land has, in the estimation of good judges, been greatly undervalued. New lands, to be bought for a trifle, and which being *new*, would naturally produce a few large crops, have allured many a youth from advantages which he and his family will have cause to regret for many generations. We have not a soil which will yield copiously without assiduous cultivation, 'tis true; but we have a soil which as richly repays the labor and expense bestowed as in any part of the world.

It is yet to be proved whether the soils in the western States, after a hundred years of cultivation, will be better than ours; and it is further yet to be proved, whether their sand and alluvion will as well sustain the manures necessary to recover an exhausted soil, as our own granite base.

Larger crops than are here obtained, wherever the hand of the diligent applies the plough and manure with liberality, if attainable are hardly desirable. A few spots in which an improved system of agriculture has been introduced, have proved the boundless resources which our soil may supply, whenever our people shall be induced to apply their energies to this branch of industry. A hundred bushels of Indian corn, sixty bushels of oats, forty bushels of rye, three tons of hay, three hundred bushels of potatoes, have severally been raised on an acre of our soil—and when its value compared with prices in the western country, is taken into the account, it is believed that few cultivators of the soil will find a richer reward. If man could live by bread alone, it might perhaps be an object to transport ourselves to the banks of the Ohio, where grain generally bears from one-fourth to a third of the price it does here: but we are now speaking of farmers, living in decent style, who have many things to buy, and ought always to have something to sell, and to such, one bushel of grain raised here, will bring him in as much cash, or the necessities of life, as four raised in the western country.

When in former years I used to partake of the labor of "hay time," and brooded over the hardship of spending all summer in providing food to sustain the cattle over winter, I thought the farmers of the south were blessed indeed, where the cattle could find their own food on green pastures all the year, and fatten at large beneath a milder sky. But upon better information I found, that instead of raising fine cattle without labor, they could scarce raise them at all; that their beef was poor, and a Georgia cow scarcely yielded more milk than a New England goat; and that instead of green pastures, all the year, grass hardly grows, and they scarcely know what a green pasture is.

A medical friend,* who spent a summer in Georgia, observed that all appearance of green grass in fields of pastures, is entirely parched and dry by August; that the few cattle live on straw and the tops of corn, and by picking a little grass along the banks of streams and in shady places. So that our southern states, aside from the artificial curse of slavery, can hardly claim advantages over New England.

We enjoy advantages somewhat peculiar in having fertile lands along the sea-coast, so that we have a ready market, and our green hills greet the eye of the mariner as he sails along our shores. The other maritime counties of this State would suffer much on a comparison with Essex. And along our southern coast, Virginia, the Carolinas,

and Georgia, present for the most part, for eighty or one hundred miles from the sea, pine barrens, sandy plains, and swamps, abounding in noxious insects, and venomous reptiles. A single swamp lying in Georgia and Florida, is one hundred and eighty miles in circumference! and no degree of fertility, or an everlasting summer could compensate for the pestiferous exhalations, which during many months of the year load every breeze with pestilence and death. Another medical friend* who spent a summer in Charleston, South Carolina, informs me that though the city is extremely unhealthy compared with northern cities, yet the country around it is vastly more so. Very few white people live in, and as few as possible attempt to cross over the level country for sixty or seventy miles back of Charleston in summer. To go beyond the ramparts of the city, especially in the night time, is for many months almost certain death! Now what degree of fertility added to our soil would compensate for such an atmosphere!

Casting our eyes to the south west, the country along the lower Mississippi, must have been once an immense bay, or arm of the Gulf of Mexico, but the alluvial deposit, floated annually down this immense river, from the boundless west, has filled up this bay, and made most of it into swamp, and part of it into something like dry land. The immensity of waters from three thousand miles, and ten thousand hills, still kept a main channel through this wilderness of *water and mire and drift-wood*, and depositing more soil, when the thickened waters first spread from the main channel, than was carried further back, the banks of the river became much higher than the back country.

The fertility of this soil, and the advantages for commerce have allured people to settle along this river bank; and an artificial dam has been erected for one hundred and seventy miles above New Orleans, to keep the waters in the river during its annual overflow, and to defend the city of New Orleans, and the plantations which lie behind this bank from inundation! Here land more fertile than your granite hills offers its abundance of cotton, sugar, rice and corn, but among those rich plantations the malaria sweeps with the besom of destruction, and hundreds of our enterprising young men go annually to gain property, and take the fearful chance of laying their dust, where even a grave cannot be prepared, but fills with water before it receives its tenant.

A clergyman of this State,† who was seized with this spirit of emigration some years ago, and has indulged it to his heart's content, informs us that the villages on the Arkansas and Red rivers, are uninhabitable during summer, and the people leave them and build camps in the woods, and on higher grounds to escape certain death. He spent one summer in one of these encampments, battling with the mosquitoes, and resolving to improve the first moment of escape to a more northern climate.

Over all this southern region of the United States, you might search in vain for an assembly like this. An industrious yeomanry is there unknown. There the taskmaster brandishes his lash and the slaves labor beneath a burning sun, curse the race that fatten and luxuriate upon their toil,

and whet the appetite of revenge and the scythe of death for a day of future retribution.

Fathers and mothers of New England! Could all the gold of Mexico induce you to fix your domicile, and leave your children, where their only chance of safety was the prospect of holding a population of two and a half millions, and their rapidly increasing posterity in a state of perpetual bondage? with an equal chance that thirty years will turn the scale, deluge the country in blood, and give the white population only the desperate alternatives of death, slavery or exile?

Comparing the higher regions of the great valley of the Mississippi with our own State, we shall also find its advantages so nearly overbalanced by disadvantages, that a wise man will feel reconciled to the soil and climate of New England.

The immense vegetation which annually decays in a rich alluvial soil, saturated with water, is sure in a warm or new country, to render the air unhealthy, and produce bilious and other diseases. Here, if we find a few acres of swamp, too low to be drained into some running stream, we consider it a deformity, and are suspicious of its influence upon health; but in all the boundless regions of the west hitherto explored, swamps lying so low that the rivers annually overflow into them, and there leave ponds of fresh water, to stagnate and pollute the air, are a general feature of the country. Here, the waters run off from our hills, plains and meadows, into the rivers; there, over millions of acres, the waters come down the rivers, overflow their banks, and run back into the swamps. Much of this land may in process of time be made useful, by cutting canals through the river banks, that the waters may drain off when the inundation subsides, but a population of one or two to a square mile, makes slow progress in draining the unnumbered thousands of stagnant pools and "dismal swamps."

I should consider myself as criminal were I to traduce the character of a country as the character of an individual; and I would not state these facts in such an assembly, but for what appear to me justifiable motives.

Thousands of our youth have been allured from their paternal homes by accounts of the plenty and fertility of western lands, without duly considering the labors, privations and perils they must encounter, in cultivating and reaping the fruits of this fertility, in the bosom of a wilderness, on the borders of an immense desolate prairie, or in the midst of a spreading inundation.

Nor have many of these emigrants considered what they will find painfully true, that they and their generations will have passed off the stage, before their new homes possess the advantages of a New England settlement,—comfortable dwellings, fruitful orchards, good roads, social villages, schools of science, and temples of the living God.

Every mail from the west teems with the Macedonian cry, come over and help us. Hundreds of youth accustomed to spend their sabbaths in the churches of the puritans, now find by privation, the value of those privileges which perhaps once they slighted; and the question whether this floating population, brought together from the four quarters of the world, is ever to settle down into anything like the moral and religious society of New England is yet to be decided.

An intelligent gentleman with whom I lately conversed, who went from this country in 1817,

* Dr. Warren Abbot, deceased.

* Alonzo Chapin, M. D. now Missionary at the Sandwich Islands.
† Mr. Flint.

and resides in one of the principal cities on the Ohio, and who has been more successful in his pursuits than most of his fellow emigrants, says he would not advise any one to go into the western valley who is comfortably situated as to business or property here. A long life scarcely serves to wean a person of common sensibility from the faces of his friends and the tombs of his ancestors. To thousands who have gone out from among us, New England will still be their "home," and the western valley their place of exile.

It is true my friends, that you might go where you would find a deeper soil, and a milder climate, or you may command a wider extent of territory, and live with less labor—but who of you would exchange your sloping hills and your granite fences, for the vast prairies and wooden fences of the west.

Who of you would leave your warm barns and well fed flocks, that you might see your cattle picking a precarious existence through the winter, in marshes and fens, or shivering with wet and cold around an uncovered hay-stack?

Who, to avoid the drifting snow and driving sleet, would leave the land of pleasant sleigh-rides, and happy winter evenings, to breathe the sirocco which sweeps from the Gulf of Mexico for weeks together, up the boundless valley, loaded with the fetid exhalations of a thousand bayous and swamps? (To be concluded in our next.)

MASS. HORTICULTURAL SOCIETY.

Saturday, April 19, 1834.

Seeds of the Chizinoya, Kneesberry, Ciruella, and the Peruvian Squash, received from a gentleman in Lima, were presented by B. F. Hallett, Esq.

Scions of the Winter Catherine, and a fine Seedling Pear, presented by Edward S. Rand, Esq. of Newburyport, for distribution. E. Vose.

From the Genesee Farmer.

WOOD SNAPPING ON THE FIRE.

I BELIEVE we have no wood in this country, that is more worthless for fuel than the Butternut. A few cuts of this kind, however, about ten inches in diameter, had been split in two, left some weeks to dry, and then carried into my chamber. On placing one stick on the fire, it began to snap most remarkably; sometimes there were not less than fifteen or twenty sparks on the carpet at once; and the inconvenience was serious. What was to be done? I happened to recollect a paragraph in your 2d volume, taken from some eastern paper, stating that *wood snaps on the fire from the side nearest to the heart*. It was so in this case. I just turned the log over, and at once the difficulty was at an end; for though it continued to snap for some time against the back plate, yet no more sparks came into the room.

When I put on the next log, I was particular to turn the heart backwards, and I have had no trouble from snapping since. Now the knowledge of this thing is but a trifle indeed, but it may be worth knowing, for I have often seen the guests round a parlor fire, starting up to put out the sparks, when I presume nothing more was wanting than to turn over a stick. A FARMER.

Receipt for Scarlet Fever. A very simple remedy, says a correspondent, for this dreadful disorder, is now using in this city with good effect. It is merely a mixture of cayenne pepper, salt and vinegar, used as a gargle.—N. Y. Com.

HINTS TO FARMERS.

If you neglected your farming utensils last fall, bring them forward now and see if they are in good order. Apply a coat of paint to the wood; it costs but little and will preserve them from warping and decay. See if there is a peg or a nail lacking, and be sure to replace it. Look to your fences and see that they are in good order. A stone wall looks much neater than a brush fence, or a crazy, rickety rail fence, that a poor old sheep can't rest his bones against without endangering his neck. A bad fence is a fruitful source of quarrels between neighbors. Scrape up the chips about your door yard, let them decay in heaps; they make excellent manure. Don't work your boys too hard; but be sure to keep them diligent. Don't keep them a digging and driving that you may have the better chance to lean over the fence and wrangle about politics, or loiter at "the corner," about the stores or tavern. Set them an example of industry and promptitude yourself and they will be very likely to follow it. Let them pick up the stones about your farm, and pile them in heaps, to make a wall, repair the roads, or at least to be out of the way of your scythe, hoe and ploughshare. Don't let them work with great heavy implements requiring the strength of a man to wield them; if you are able, furnish them with those of a light hand make, and they will work with greater alacrity. Give them a piece of ground of their own to cultivate; it will incite them to prudence and activity. But don't neglect their education, let what will come. Employ a good teacher and be sure that your children go regularly to school. Don't keep them at home to do work you might just as well do yourself. Don't let them go a courting till they have a thorough knowledge of grammar, geography, arithmetic, and practical farming. You had better examine the first love letter they write, and if it is misspelt, don't let them "go ahead." While looking after yourself and the boys, don't forget your wife and daughters. It is hard work to scour up the floors, and the expense of a coat of yellow ochre is a mere trifle. You better put it on—it will save the girls from fretting and your wife from growing old.—Don't keep them a borrowing swift and reels, tubs and wheels: if you are a common manager you can do so easily. If they ask for a new gown or a pair of shoes don't scold, and rate them about extravagance, when perhaps those they have are as old as the hills, but buy them if you are able; if not, tell them so kindly and frankly, and if they are as reasonable as our farmers' wives and daughters generally are, they will say no more about it. Don't let them ape city dress and fashions; a plain simple attire is always more becoming than a tawdry imitation of the prevailing mode.

Girls must know something more than merely to read and write; they can't have too much arithmetic; and a knowledge of all the English branches of education will make them contented at home, prevent gadding, tattling and romping. Finally, don't borrow, but take at least one newspaper; you will find your account in the superior intelligence, capacity and capability of your family: your barn, your fields, your house and family will show it.—Portland Courier.

THE Rev. Mr. Madden of Kildenny, died in consequence of taking the *glanders* from a favorite poney he was treating for this complaint.—Genesee Farmer.

From the Genesee Farmer.

A VEGETABLE STOREHOUSE.

Mr. L. Tucker—I write not to adorn the pages of the Farmer, but to increase its usefulness; and confer a favor upon my countrymen. Last autumn I built a cellar in the following manner—by making a hole 18 feet in length, 8 feet in width, 3 feet in depth,—placing over it seven pairs of rafters, the pitch being a right angle. I then covered it with boards, straw, coarse hay and dirt. The following is an estimate of the cost:

| | | |
|--------------------------------------|------|--------|
| Boards and scantling, 400 feet, | - | \$2,00 |
| Shoveling out, 1 day, | - | 75 |
| Making roof and door-way, 1 1-2 days | 1,50 | |
| Covering 1 day, | - | 75 |
| | | \$5,00 |

Thus I have stored nearly 300 bushels of potatoes—they have kept warm and dry. I have fed of them to hogs, cows, and beef cattle every day through the season with very little trouble. For apples or cider, for turnips or any other roots, it is the best within my knowledge. In my opinion every considerable farmer should have two or more of this form, which will hold 1000 bushels each, with a shed over the door-way of one, and a steaming apparatus at the side of the door—the whole placed near the pig sty and barn. Then, my brother farmers, we could raise turnips, mangel wurtzel and carrots, feed them with our corn and rye, make more and better pork—more and equally as good beef; and solve the question about surplus grain and alcohol. It may be said that this cellar will rot down in a few years; then will I rebuild it by placing over it straw and tan bark; then cover the whole with boards and it will be as durable as most out-buildings.

Now I would ask if ice secured in the above manner would not be useful for keeping early butter, cooling cream, and tempering milk rooms, &c. through the summer? If corn meal, wet up and steamed in the form of dumplings with potatoes, would not be an improvement? I would ask also, if a crop of beets thinned out for fattening hogs in summer, fed to store hogs in winter, would not be valuable, and answer the place of peas and corn? I would inquire for a simple and useful plan for steaming vegetables, that will cook ten or fifteen bushels at one time; and last, though not least, I would ask if farmers generally cannot consume their corn and rye at home with greater profit than to sell it to the distiller at present prices?

INDELIBLE INK FOR LINEN, &c.

Put half a drachm of lunar caustic (nitrate of silver) into a small vial of water; and a piece of gum arabic of the size of a pea, and a little of the paint called sap green, to make it more legible while writing. When the whole is dissolved it is fit for use. That part of the cloth to be written on, must be previously wet with a mixture composed of a small quantity of pearlash and gum arabic dissolved in water, and pressed smooth with a hot iron. The writing should be exposed to the sun, which will cause it to dry darker than in the shade.—Mechanic's Magazine.

Wheat when cut green, shrivels more than barley, and the latter more than oats. Oats will retain their plumpness when cut quite green.—Genesee Farmer.

MIDDLESEX CATTLE-SHOW & PLOUGH- ING MATCH:—Concord, October 8, 1834.

THE SOCIETY OF MIDDLESEX HUSBANDMEN AND MANUFACTURERS

Hereby offer the following Premiums for the Encouragement of Agriculture, Manufactures and the Cultivation of Trees within the County of Middlesex:

AGRICULTURAL EXPERIMENTS.

For the greatest quantity of Hops on 600 hills, not less than 1000 lbs. - \$10
the next greatest quantity, &c. - 5

No person will be allowed to receive a second premium for the same Hop Field.

LIVE STOCK.

For the best Fat Ox, at least expense, \$8
the next best, - 5
the best Bull, not under 1 year old, 10
the next best, - 8
best Bull Calf, not over 12 nor under 6mo. 5
the next best, - 3
the best yoke of Working Oxen, 10
the next best, - 8
the next best, - 6
the next best, - 5
the next best, - 4
the next best, - 3
the best 3 year old Steers, 7
the next best, - 5
the best 2 year old, do. 6
the next best, - 4
the best yearling Steers, - 4
the next best, - 3
the best Calf Steers, - 4
the next best, - 3
the best Milch Cow, - 12
the next best, - 10
the next best, - 8
the next best, - 6
the best Milch Heifer, under 3 years old, 8
the next best, - 6
best Heifer Calf, not over 12 nor under 3 m. 5
the next best, - 3

None of the above animals, except Calves, will be entitled to premiums, unless they have been owned in the County of Middlesex, at least one year previous to the time of Exhibition. Milch Cows and Heifers will not be entitled to a premium unless the owner furnishes a certificate, showing the mode of keeping and quantity of milk given.

DOMESTIC MANUFACTURES.

For the best piece of Broadcloth, not less than 15 yards, 6 quarters wide, - \$10
the next best, - 7
the best piece of plain Cloth, not less than 15 yards, 3 quarters wide, 6
the next best piece, - 4
the best piece of Kerseymere, not less than 15 yards, - 6
the next best piece, - 4
best piece of Flannel, not less than 20 yds. 5
the next best piece, - 4
the next best, - 2
best Sole Leather, not less than 6 sides, 8
the next best, - 4
best Harness do. not less than 100 lbs. 6
the next best, - 2
the best dressed Calf Skins, not less than 12 skins, - 6
the next best, - 4
the best Neat's Leather, do. 6 sides, 8
the next best, - 4
the best Cowhide Boots, do. 3 pair, 6
the next best, - 4

the best Calf-skin Boots, do. 6 pair, 6
the next best, - 4
the next best, - 2
the best Men's Shoes, do. 6 pair, 4
the next best, - 2
the best Ladies' Shoes, do. 6 do. 4
the next best, - 2

A minute and accurate account of the expense of manufacturing said articles must be exhibited.

HOUSEHOLD MANUFACTURES.

For the best piece of Carpeting, not less than 20 yards, 1 yard wide, - \$8
the next best, - 5
the next best, - 3
the best Woollen Coverlet, - 4
the next best, - 3
the best Woollen knit half Hose, not less than 6 pair, - 3
the next best, - 2
the next best, - 1,50
the next best, - 1
the best Straw Bonnet, - 3
the next best, - 2
the best pair of Woollen Blankets, 3
the next best, - 2
the best Hearth Rug, - 4
the next best, - 3
the next best, - 2

After examination, the goods will be considered in charge of the owners, but must remain a short time for public inspection.

BUTTER.

For the best Butter, not less than 100 lbs. to be made before the 10th of July next, \$10
the next best, - 8
best new churned do. not less than 20 lbs. 5
the next best, - 3
the next best, - 2

Certificates of the manner in which it has been made and preserved will be required.

WHITE MULBERRY TREES, AND CULTURE OF SILK.

For the best Plantation of White Mulberry Trees, not less than 150 in number, which shall be in the best thriving condition in the Autumn of 1834, - \$25
the next best, - 15
the best speci. of Silk, not less than 3 lbs. 9
the next best, - 7
the next best, - 4

Certificates will be required of the manner and expense of growing the Silk, with evidence accompanying the same.

SWINE.

For the best Boar, - \$8
the next best, - 6
the best breeding Sow, - 8
the next best, - 6
the best Pigs, not less than 3 in number, from 4 to 8 months old, - 5
the next best, - 3

All unsuccessful competitors for premiums offered by the Society for Stock and Swine, shall be allowed from the funds of the Society eight cents per mile for travel from their respective places of abode to the town where the annual Show is holden.

CIDER.

For the best specimen of Cider, not less than 3 dozen bottles made in 1833 manufactured by the person who shall exhibit the same,

from apples grown on his own farm, and to be used at the annual dinner of the Society, \$8
the next best, - 5

A certificate of the manner of making the same will be required; the Cider must be pure, without the addition of Spirituous Liquors of any kind.

FOREST TREES.

For the best Plantation of White Oak Trees, not less than half an acre nor fewer than 500 trees thereon, to be raised from the acorn, and which shall be in the best thriving state in the Autumn of the year 1834, \$20
the second best, - 15
the third best, - 12
the best plantation of White Ash Trees, not less than an acre, nor fewer than 150 trees thereon, to be raised from the seed, and which shall be in the best thriving state in the Autumn of the year 1834, \$15
the second best, - 10
the third best, - 8
the best plantation of Elm Trees, not less than one quarter of an acre nor fewer than 80 trees thereon, to be raised from the seed, and which shall be in the best thriving state in the year 1834, - \$8

FRUIT TREES.

For the best Apple Orchard, not less than 75 trees, which shall have been planted or set out since the year 1826, and shall be in the best thriving state in the Autumn of 1834, \$15
the second best, - 12
the third best, - 6
the best engrafted Pear Trees, not less than 30 trees, set out since the year 1826, and in the best thriving state in the Autumn of 1834, - 10
the next best, - 5

Premiums will be awarded for the best specimens of Apples, Pears, Peaches, Grapes and other Fruits to be used at the annual dinner of the Society; Premiums will also be awarded for the best specimens of Vegetables.

FARMS.

For the best cultivated Farm, regard being had to the quantity of produce, manner and expense of cultivation, and the general appearance of the Farm, - \$25
the next best, - 20
the next best, - 15
the next best, - 10

Notice will be given in the public Newspapers of the time when the Committee on Farms will commence their examination, and any person desirous of having his Farm inspected may make application to the Secretary through the Trustee of the town where he resides, or to either of the Committee.

MACHINES AND TOOLS.

To the person who shall produce at the Show, any Agricultural Implement of his own invention, which shall deserve a reward not exceeding, \$10

Certificates are to be produced to the Committee, proving its utility.

PLOUGHING MATCH.

To the Owners of the ten Ploughs, to be drawn by oxen, which shall be judged to have done the best work with the least expense on one quarter of an acre:—

| Double Teams. | | Single Teams. | |
|----------------|------|----------------|------|
| First Plough, | \$10 | First Plough, | \$10 |
| Second Plough, | 8 | Second Plough, | 8 |
| Third Plough, | 6 | Third Plough, | 6 |
| Fourth Plough, | 4 | Fourth Plough, | 4 |
| Fifth Plough, | 3 | Fifth Plough, | 3 |

It is understood that no person who has obtained a premium at any previous Ploughing Match, can contend for the same or less premium, with the same Oxen. No person shall be a competitor at the Ploughing Match after he has obtained the Society's first premium. And no person shall contend for either of the Society's premiums unless he is the owner of the Oxen and Plough, and acts as Ploughman himself or some person who works on his Farm. Single Teams will plough without a driver.

All competitors in Ploughing, must enter their names with the Secretary, before eight o'clock, on the day of the Show.

TRIAL OF WORKING OXEN,

Will take place immediately after the services in the Meeting-house.

All Competitors in this trial must enter their names with the Secretary, before 9 o'clock on the day of the Show.

LONG TEAM OF WORKING OXEN.

Thirty Dollars will be awarded to the drivers of a Long Team of not less than one hundred yoke of Working Oxen.

It is understood, that whenever merely from want of competition, any of the claimants might be considered entitled to the premium, under a literal construction, yet if in the opinion of the judges, the object so offered is not deserving of any reward, the judges shall have a right to reject such claim. No article or animal, on which, to any owner one premium shall have been awarded, although that premium may have been the lowest, shall be considered a subject for any future premium of the Society, except it be for qualities different from those for which a premium has been awarded.—Milch Heifers will not be allowed to take a premium as Milch Cows; the same pair of Steers will be allowed to receive but two premiums. The proof of Agricultural Experiments, and the manner in which they were conducted to be offered at the Annual Meeting of the Trustees. The Society have reserved fifty dollars to be awarded to such person as shall exhibit any article of utility, for which no premium is offered above. If any competitor for any of the Society's premiums shall be discovered to have used any disingenuous measures, by which the objects of the Society have been defeated, such person shall not only forfeit the premium which may have been awarded to him, but be rendered incapable of being ever after a competitor for any of the Society's premiums. MEMBERS OF THE SOCIETY who shall have premiums awarded them, will be entitled by a vote of the Trustees to an allowance of ten per cent, in addition to the premiums mentioned in this bill.

BENJAMIN F. VARNUM, President.

JOHN STACY, Secretary.

From the Genesee Farmer.

LARGE WHEAT CROP.

At the annual meeting of the Agricultural Society of this county, (Monroe,) in October last, the Society's first premium for the best acre of Wheat, was awarded to Mr. Jirah Blackmer of Wheatland, the acre producing, according to the certificate

presented to the Society, sixty eight and 43-60ths bushels. The conditions on which the premium was granted, not requiring a statement of the manner of its culture, Mr. B. has, at our request furnished the following:

Mr. L. Tucker—Agreeable to the request which I recently observed in the Genesee Farmer, I give you an account of the culture of an acre of wheat for which the first premium was awarded by the Monroe County Agricultural Society, in October last. This acre was a part of a field containing twenty-two acres, which had lain four years in clover, and had been occupied as pasture. It had never received any barn manure, but had several times been sowed with plaster or gypsum.

The acre which I selected, lay in a basin or hollow, and the surface of the ground gradually descended towards it in every direction; and in a time of heavy rains, or the snow going off in the spring, it was generally flowed with water, which made it very rich. The natural soil is a sandy loam, with an excellent sub-soil. I had the stones and other obstructions to the plough, removed, and ditches cut to prevent the water from running into it in a wet time and flowing it. In the fore part of June, the field was ploughed deep with a good team—in August it was harrowed and cross ploughed quite deep; and the fore part of September it was again harrowed and ploughed very fine. On the 14th September it was sowed with a little less than a bushel of seed to the acre, one half white flint, and the other red chaff mixed together. It was harvested the 25th of July when it was quite green, and the kernel but just out of the milk. It stood the thickest on the ground of any wheat I ever saw, and the straw was large and very tall, yet so firm that it did not lodge—the heads were unusually long and well filled, so that nine sheaves yielded a bushel.

I would remark, that I am satisfied from experience and observation, that plaster is not only highly beneficial to grass lands, but of great service to grain crops, and I almost invariably fail of a grain crop unless I plough deep.

Yours, with respect,

JIRAH BLACKMER.

Wheatland, March 17, 1834.

ON RENDERING TIMBER MORE DURABLE.

WE copy from the Rail Road Journal another paragraph on the preservative quality of lime when applied to timber in damp places. The writer is said to be "an Engineer of great experience."

"I am induced to communicate a fact corroborative of the opinion of your correspondent G. that lime is a preserver of timber. Some fifteen years ago, a friend of mine removed a decayed mill trunk in order to replace it with a new one. The trunk had been laid under ground; and when it was covered with earth, a few scattered lumps of lime were accidentally thrown upon it. On its removal it was discovered that every part of the wood which was in contact with lime was as perfectly sound as when it was first laid, whilst every other part was more or less decayed. Indeed those parts exhibited a freshness and soundness which was truly remarkable."

It has been mentioned to us that some farmers in Bucks county, Pennsylvania, have soaked the lower parts of their posts in vats containing lime water, previous to their being set or planted; but we have no further information on the subject;

and we shall be much obliged to any person in that quarter or elsewhere who will send us a statement of such experiments.—Genesee Farmer.

WHEAT.

LAST spring we published some suggestions on the late sowing of spring wheat, as a means of saving it from the ravages of a little yellow worm which some incorrectly call the weevil. A number of our subscribers tried the experiment, and so far as we have heard with entire success. A farmer in Orange County told us that he sowed one acre of spring wheat ten days later than the rest in the same field. The first sowed was seriously injured, the last not at all. Several in other towns made similar statements.

It has been observed from the first appearance of this insect, that the earliest winter wheat was less injured by its attacks than any other. It is evident therefore, that the time of laying the egg is short. It is, probably, soon after the heads make their appearance. Before they are defended by the leaf which encloses them, and when they appear, most probably, the husk soon becomes so hard that the insect cannot pierce it to deposit her eggs upon the kernel. We have then only to ascertain the time as exactly as we can, in which the injury is done, and have our winter wheat too forward, and spring wheat not forward enough, for the operations of the insect, and the damage is avoided. At present sow your winter wheat as early as you can, and sow your spring wheat as late as you can, and give it time to ripen.

Vt. Chron.

HONEY BEES—IMPORTANT SUGGESTION.

A RESPECTABLE farmer of this neighborhood, called on us, a few days since, for the purpose of inviting us to give publicity to a practice adopted by him for preserving Bees through the winter, which he considers as one of great utility and importance to farmers who produce their own honey. Our informant states, that he has kept Bees for a number of years, and after pursuing several expedients for the preservation of his Bees through the cold weather, he last fall placed his hives upon a suitable bench in his cellar, which was perfectly dry, and from which all light was excluded. Upon bringing the hives again into the open air, a few days ago, the Bees exhibited an unusual degree of healthiness and activity, and there were but a very small number of dead ones in any of the hives. This experiment is in our informant's opinion, a very successful one, and well worthy the attention of those farmers who engage in this branch of rural economy. It is at least deserving of a repetition.—West Chester Herald.

CURIOUS CASE OF FARRIERY.

SOME time ago a valuable mare, belonging to Mr. C. Linny, of Baylin, was gored by a bull, and the entrails protruded through the wound. As there appeared no possible remedy, the animal was left in the field to die—when a neighboring man named Moran undertook to cure her. After returning the entrails and sewing up the wound, he procured a large piece of sheet-lead, placed it over the spot, and afterwards drew the skin across it and sewed it up. After an interval of some days, he again ripped the skin open and removed the lead, when the wound appeared completely healed. The skin was a second time sewed up; and in less than a month after, the animal was able to plough as well as ever.—English paper.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, APRIL 23, 1834.

VEGETABLE PHYSIOLOGY.

The following article on forming new varieties of vegetables, is not only curious but useful in a high degree. It describes the process by which we may obtain new sorts of fruits, flowers, and indeed of all useful plants, in a manner analogous to crossing the breeds of animals to introduce new and improved kinds.

The discovery of the art of improving vegetables by mixing their races, will eventually lead to improvements which the most ardent imagination can scarcely anticipate. Gen. NEWHALL will be so good as to accept our thanks for this communication, and we should be glad to often have occasion to acknowledge similar favors from the same donor.

For the New-England Farmer.

ON THE ART OF IMPROVING VEGETABLES BY CROSSING THE BREEDS.

MR. FESSENDEN—

In this age of investigation into the laws of nature, one of the most important discoveries in vegetable physiology, is the sexes of plants, and the consequent power we possess of creating new varieties of fruits, by the cross fertilization of flowers of different plants of the same variety. To this knowledge we are indebted for many of the finest fruits now in cultivation.

Although this science is of recent date, yet it is evident that Lord Bacon suspected that it was possible to cross the breeds of plants, and so procure new kinds, for we see, says that great man, in speaking of the animal world, that there are compound creatures, the offspring of different varieties, &c. and in relation to the vegetable creation, he says, "The compounding or mixture of kinds in plants is not found out; which nevertheless, if it be possible, is more at command than that of living creatures; wherefore, it were one of the most notable experiments touching plants to find it out, for so you may have great variety of new fruits, and flowers yet unknown."

Bradley, who wrote in 1718, is the first author who speaks on this subject as being accomplished; but the exact method was not then clearly understood; as he only directs it by bringing the branches of different trees together when in blossom.

In the English Monthly Review for November 1750, an account of the mixed breed of apples is noticed by Mr. Benjamin Cook, and is clearly explained by the editor's observation. It now appears to be perfectly understood; and as the season is approaching when this operation can be performed, and the foundation laid for further improvements in the interests of horticulture, I give you the process by which this object may be effected, in an extract from Phillips' Pomarium Britannicum, hoping it may be acceptable to that portion of the readers of your valuable paper, who have not the means of readily consulting the best authors on the subject.

The description and drawing is for the apple, but the same principle will apply to every other plant and flower.

"The apple-blossom contains about twenty stamina, or males, which are represented by Fig. No. 3, and generally

five pointals or females, which form the centre of the cup or cavity of the blossom, as in Fig. 4. The males stand in a circle, just within the bases of the petals, or flower leaves, and are formed of slender threads, each of which terminates in a small yellow ball or anther, as in Fig. 2. As soon as the blossoms are nearly full grown, as in Fig. 1, they must be carefully opened, and all the male stamina cut or extracted, so as not to injure the pointals or females, which will then appear as in Fig. 4. The blossoms are then closed as in Fig. 1, and suffered to remain till they open spontaneously. From the blossoms of the tree, which it is proposed to make the male parent of the future variety, must be taken a portion of their pollen or farina, when ready to fall from their mature anthers; and this pollen must be deposited upon the pointals of the blossoms of the tree, which is intended to bear the variety, which consequently will afford seed. By shaking the blossoms over a sheet of white paper, you will ascertain when the pollen is ready. It is necessary in this experiment, to cover the branches on which the prepared blossoms are, with a thin muslin or gauze, so as not to touch the flowers, or keep off the sun or air, but to prevent the bees or other insects from inoculating them with the pollen of other blossoms, which would make the experiment uncertain; and in order to obtain the fruit and the seeds of a large size, it is best to leave but a few blossoms on the tree, and, at all events, to clear the branches on which the prepared blossoms are, from all other blossoms. When the fruit is quite ripe the seeds should be sown at a proper season, and in suitable soil, and in about six or eight years fruit may be expected."

I am, sir, with high regard, yours,

Lynnfield, April 12, 1834.

J. NEWHALL.

FARMER'S ARMORY.

TRAVELLERS who have visited the armory in the Tower of London, at Malta, &c. are struck with the great variety of weapons that were used by the warriors of ancient and modern times. They inflicted death in all ways; by cutting, stabbing, blowing up, and knocking down. Many of these instruments of destruction have been transformed into instruments of husbandry, and the curious, and others, may

see them in their present various forms at the Agricultural Warehouse, North Market street, and where those "who go to see," remain to buy."

First, there is the original seed, to produce all sorts of grapes, grains, trees and ornamental plants. There are axes to cut down the trees, ploughs and harrows to prepare the soil after the woodman, machines to drop seeds, rakes to cover them, hoes to eradicate weeds, sickles, scythes, and cradles, for the harvest, mills for grinding the grain, and engines for cutting the straw. There is every thing necessary for that respectable animal, the cow. There are pails for the milk, and pans also—there are churns for the butter, presses for the cheese, bells for the neck, and tips for the horns. The gardener has as many tools as the surgeon—he has his amputating set, his saws, and his knives. It is worth while for any farmer, or reader of georgics and pastorals, to visit the establishment.—*Boston Courier.*

ITEMS OF INTELLIGENCE.

Farm School. The following gentlemen were elected on Monday, to the government of the Boston Farm School. Charles Jackson, President.—Charles C. Paine, Secretary.—George Ticknor, Treasurer.—Thomas B. Wales, John Tappan, John D. Williams, Moses Grant, Th. C. Carey, Charles Wells, Jonathan Phillips, Joseph Tuckerman, George W. Beale, Directors.—*Merc. Journal.*

Famine on these Shores. The Nova Scotian gives appalling accounts of famine and distress existing in some parts of Cape Breton. Many families have been reduced to the necessity of taking only one meal a day, consisting of potatoes of miserable quality.

The Wheels of Enterprise still roll backward. The Methuen company have given orders to their Agent, to stop so much of the works in this place, as are devoted to the manufacture of Sheetings.—*Iris.*

Strawberries were in the market at Tallahassee, Florida, in the month of March. New potatoes had also made their appearance.

Steam and Machinery. The estimated number of looms propelled by water and steam power in the United Kingdom, including those in preparation for working previous to the stagnation, and as near as any calculation can be made, is 58,000. The average produce, taking it at 32 square yards a day, makes 1,254,000, or 1,741 yards a minute; weekly, 7,524,000; monthly, 31,300,000; yearly, 376,200,000. Allowing to each person six yards for yearly consumption, will supply 62,700,000, and will cover 62,700 acres of ground, and in length would extend 213,750 miles, and reach across the Atlantic 71 times.—*Eng. paper.*

Birds. The Rev. Dr. Miller in his work entitled "A Retrospect of the Eighteenth Century," states, that there are 2,536 kinds of birds. Latham described 96 genera, and 2,046 species.

The additions made in his subsequent volume, have increased the number to 3,000.

The number of birds treated of by Linnæus, did not greatly exceed 900.

A dealer in horse flesh to the Westward, advertising the arrival of a drove of horses, recommends them to his customers, as being "uncommitted in politics, and each bearing his own certificate of qualification."

"Congress cannot take out of the hands of the Executive department, the custody of the public property or money, without an assumption of Executive power, and a subversion of the first principles of the Constitution."—*President Jackson's Protest.*

In the U. S. House of Representatives, Mr. Wise of Virginia offered the following Resolution:

Resolved, That Congress can take out of the hands of the Executive department the custody of the public property or money, without an assumption of Executive power, or subversion of the first principles of the Constitution, by repeal and enactment of such laws as may be necessary to that end.

Great Herds of Cattle. Mr. Gwin of Madison county, Ohio, keeps 1200 head of cattle for which he has ample lands and enclosures; and many of his neighbors, who are in the cattle business, have herds of from two to eight hundred, and lands in proportion. It is wonderful to those who can carry back their recollection for a few years, when the whole state was an entire wilderness, to behold Ohio now outstripping most of the old states in population and agricultural improvement.

A Pedestrian. An Englishman arrived in our city on Monday evening from the South, who has attracted a good deal of notice. He has travelled on foot throughout all the countries of Europe, without any other known motive, than the gratification of his own curiosity. The apparent insufficiency of this reason for so much fatigue, has brought upon him the suspicions of official agents, and caused him to be repeatedly arrested. He is now examining our country as he has examined Europe. He is said to be a man of property and intelligence, though his appearance indicates neither. His habiliments are mean, and all his baggage consists of a small bundle and a cage which contains the only companion of his travels—a favorite canary bird.—*N. Y. Journal of Commerce.*

Ohio Manufactures. The Scioto Gazette published at Chillicothe, Ohio, contains the following paragraph:

We were invited a few days since to examine a piece of white flannel of beautiful texture and appearance, manufactured by Mr Wm. Reister of this country. It contains about 37 yards, is about one yard wide and of a very excellent quality. Mr. Reister obtained at the Agricultural Society's fair last fall a premium for the best specimen of flannel then exhibited, and he seems to be improving in the manufacture of that article.

GRAPE VINES, DAHLIAS, &c.

For Sale by HOVEY & CO, No 79 and 81 Cornhill, (late Market street.) Isabella, Catawba, Pond's Seedling, (a superior, new, native variety,) and choice foreign kinds of Grape vines, by the single one or hundred, well packed for transportation to any part of the country.

A fine assortment of English Gooseberry bushes, of the best kinds, including those that obtained the premium of the Mass. Hort. Society.

—ALSO—
A collection of the best double Dahlias, Bulbous Flower Roots, Greenhouse Plants, Hardy Perennial Flowering Shrubs, Honeysuckles, &c. &c.

PRIZE DAHLIAS.

FOR SALE, 200 varieties of the best double Dahlias. This collection of Dahlias obtained the premium awarded by the Mass. Hort. Society the two last years.

Orders left with Messrs. HOVEY & CO. No. 79 & 81 Cornhill, Boston, or C. F. PUTNAM, Salem, will be duly attended to.

GRAPE VINES AND EARLY POTATOES.

Catawba and Isabella Grape Vines, extra large size, by the hundred or single.

Early Potatoes which obtained the premium for the last five years. For sale by SAMUEL POND, Cambridgeport, Feb. 25.

C. G. GREENE'S

IMPROVED SILK REEL—PRICE \$20—For sale at the Agricultural Warehouse, No. 52 North Market Street, and by the Patentees, Windsor, Vermont. ap 23

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table mats. a 16.

PAINT OIL.

The subscribers keep on hand a constant supply of their "Prepared Paint Oil," which is offered for sale with renewed assurances of its merit. This Oil, independent of being 25 per cent. cheaper in price, will actually cover a quarter more surface, as has been repeatedly proved and confirmed by statements of many Painters. Upwards of 200 buildings in this city and vicinity can be referred to, many of them painted two years ago, which continue to look well, and retained their gloss through the first year, which is a clear demonstration of its strength. The Prepared Paint Oil is found to answer a valuable purpose to mix with Linseed Oil, giving it strength and durability with a more permanent gloss. It paints a very clear white, flows smooth, and is more free from mildew, and changes resulting from the sea air, than any other Oil.

Oil Factory (head Foster's Wharf.)

DOWNER & AUSTIN.

P. S. Please be particular to order Downer & Austin's "Prepared Paint Oil." m 19 6pis.

BUCKTHORNS.

For Sale a quantity of very fine Buckthorns, raised upon the Farm of E. H. Derby, Esq. of Salem. Apply at GEO. C. BARRETT'S Seed Store. a 9

SWEET POTATO SLIPS.

THIS day received from New Jersey, a quantity of SWEET POTATO SLIPS in fine order, and will be sold in large or small quantities if applied for soon. GEO. C. BARRETT, ap 16 New England Seed Store.

WHITE DUTCH CLOVER.

RECEIVED this week direct from Holland 1000 lbs. superior White CLOVER, warranted free from any kind of foul seed, and at least worth one third more than American. This will be found an excellent Grass for Pasture land, &c. a 16 GEO. C. BARRETT, New England Seed Store.

MANGEL WURTZEL SEED.

300 lbs. Mangel Wurtzel Seed, raised from selected roots and not imported. This article cannot be too highly recommended for Stock, yielding 40 tons to the acre, and being a most profitable crop. Sow 2½ lbs. to the acre. For sale at New England Seed Store. GEO. C. BARRETT.

For Sale at the Agricultural Warehouse, —WILLIS' Improved Cast Steel MANURE FORK, the best warranted article that has been made for the purpose. a 16

For Sale at the Agricultural Warehouse, —HARDEN'S Improved SEED SOWING MACHINE. This is one of the best labor saving machines in use, calculated for sowing small seed. The saving of seed in the use of this implement is more than sufficient to pay the cost of it annually. Price \$5. ap 16

Howard's Improved Patent Cast Iron Plough.

FOR SALE at the Agricultural Warehouse 51 & 52 North Market street, a further supply of Howard's Improved Patent Cast Iron Ploughs. The very extensive sale these ploughs met with the past season, and the very general satisfaction they gave to all persons who used them, give them decidedly the preference over all ploughs now in use—a constant supply of them will now be kept for the accommodation of the public, and all orders will be supplied on the same terms as at the manufactory. a 16

GRAPE VINES AND PEAR TREES.

FOR SALE, a few Grape Vines, plants 3 years old, at the Garden of S. G. PERKINS, Brookline, viz.—

White Chasselas or Muscadine, Purple Muscat,
Red Chasselas, Red Constantine,
Black Hamburg.

Also, a few Pear Trees.—Dwarf, Duchess of Angouleme. Apply at the Garden to Mr. ROBERTS, or to Mr. PERKINS at his Office. ap 16

TEA SPRING WHEAT.

25 BUSHELS of this valuable variety of SPRING WHEAT, of which a trial of three years has proved it to be a productive kind, not liable to blast or mildew.
There was raised last year 25 bushels to the acre, and being a sure crop, making the best of flour, it is recommended as a superior variety. For sale at the New-England Seed Store, by GEO. C. BARRETT, and also to be obtained of JOHN PERRY, Sherburne, Mass. m 12.

BRIGHTON MARKET.—MONDAY, April 21st, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 317 Beef Cattle, (including 30 unsold last week,) 11 pairs working Oxen, 13 cows and calves, 210 sheep, and 100 swine. 30 beef cattle unsold.

PRICES. *Beef Cattle*—The market was not quite so good as last week; the quality of the cattle being better, nearly as many sales were effected at the same prices. We noticed ten or fifteen taken at 5 75, all of which were very fine, and about 25 fine cattle were taken at 5 50; we quote prime at 5 25 a 5 50, good at 5 a 5 25, thin at 4 50 a 5.

Working Oxen—Sales \$62 a 70.

Cows and Calves—We noticed sales at \$20, 23, 25, 28, and 32.

Sheep—We noticed a fine lot of ten, fed by Col. Anderson, of —, taken at \$10 each; also sales at 4 75 and 7 each.

Swine—No lots were taken; at retail 5½ for sows, and 6½ for barrows, most of which were large.

SPRING RYE.

JUST received a quantity of Spring Rye, at New England Seed Store.

MISCELLANY.

From the Buffalo Emporium.

A CONTRAST:

Awa' with your lasses pinch'd up in the middle,
Drawn rearward their shoulders, and cramp'd every rib:
With cheeks like the lily that faints in the valley,
Ashamed of the labors their grandmothers did.

But give me a fine buxom lassie o' nature,
As round as a melon, as plump as a seal;
Whose cheeks are as red as a sun-burnt potato,
Whose fingers can ply both the rake and the wheel.

Our grandmothers surely had died broken-hearted,
Could they had of the future a glance of the eye,
To see how their impious daughters had parted
With stout linsey-woolsey, exotics to buy.

And hung up their distaffs, and burnt up their treddles,
And sung to their lapdogs their best lullaby;
Politely discovering their peas in the middle,
Instead of devouring a whole pumpkin pie.

Och! we dwindle away every strange generation!
Our wives are a' sickly, I've told you the why,
There will not be a man in the whole of the nation
In fifty years more that is bigger than I!

I'll tell you my height, 'tis just three feet eleven,
I'm haunted with hypo. spasmodics and spleen,
A poor sickly dwarf inheriting evil,
Because that my mother in fashion has been.

O! had the tall Alps been the place of my model,
My mother a Moor without sweet-cake or plum.
I then might have sprouted like Alick Mc Donald,
And look'd down with pride upon little Tom Thumb.

'WITHHOLDING MORE THAN IS MEET.'

THE benevolent Matthew Carey states the following fact:

"The ladies will I hope pardon me for an observation which applies to some of them, but I hope to only a few. I have known a lady to expend a hundred dollars on a party; pay thirty or forty dollars for a bonnet, and fifty for a shawl; and yet make a hard bargain with a seamstress or washerwoman, who had to work at her needle or at the washing tub, thirteen or fourteen hours a day, to make a bare livelihood for herself and a numerous family of small children. This is a sore oppression under the sun, and ought to be eschewed by every honorable mind.

"Let it be reformed altogether."

Philadelphia, June 18, 1833.

ADVANTAGES AND PLEASURES OF OBSERVATION.

THE observations made during a single voyage across the Atlantic, by a single observer, M. Humboldt on the aspect of the Antarctic regions of the heavens—the peculiar azure of the African sky—the luminous meteors of the atmosphere—the tides—the currents, and the different colors of the ocean, and other phenomena which happened to present themselves to his view—are of more value to the scientific world, than the observations of ten thousands of other beings, who for a series of years have traversed the same regions. Yet these possessed on an average, the same sentient organs, the same intellectual powers, though somewhat differently modified and directed, the same natural capacities for observation as this distinguished philosopher which required only an impulse to be given in a certain direction, in order to accomplish the same ends.

And was Humboldt more burdened and perplex-

ed, or did he feel less comfortable and happy, than his ignorant and grovelling associates in the ship that wafted them across the ocean? No. He felt emotions of delight and intellectual enjoyments, to which they were utter strangers. While they were lolling on their hammocks, or loitering upon deck, viewing every object with a "brute unconscious gaze," and finding no enjoyment but in a glass of grog,—a train of interesting reflections having relation to the past, the present, and the future, passed through the mind of the philosopher. He felt those exquisite emotions which arise from a perception of the beautiful and the sublime; he looked forward to the advancement of natural science as the result of his observations, and beheld a display of the wisdom and grandeur of the Almighty, in the diversified scenes through which he passed. Such observations and mental employments as those to which I allude, so far from distracting the mind and unfitting it for the performance of official duties, would tend to prevent that languor and ennui, which result from mental inactivity, and would afford a source of intellectual enjoyment amid the uniformity of scene which is frequently presented in the midst of the ocean.—*Dick's Improvement of Society.*

EXPERIMENT.

A BEAUTIFUL exemplification of the principles adopted by the lamented Sir H. Davy, for the preservation of copper on ships' bottoms was observable when the water was let out of the dock, on Thursday last, in which the Boyne was placed. Our readers are generally aware that Sir H. Davy proposed a certain portion of cast iron to be secured on ships' bottoms. Knowing that, in the galvanic action which takes place between the water, copper, and the iron, the acid of sea-water has a greater affinity for iron than it has for copper, he imagined that the iron would be destroyed and the copper preserved. The experiment fully succeeded, but the remedy was as bad as the disease, for the bottoms of ships became so exceedingly foul that the plan was abandoned on account of its being detrimental to their sailing. In the case of the Boyne, most of the iron protectors were converted into a perfectly soft substance resembling plumbago, while others were literally destroyed, not a vestige of them remaining. It was very remarkable that the vicinity of the protectors (and no where else) was covered by a prodigious quantity of oysters. These were devoured with uncommon zest by the workmen. It was also worthy of remark, that whilst many other ships similarly protected, had a great variety of marine animals on their bottoms, the specimens on the copper of the Boyne were almost, if not entirely confined to oysters. Whence this difference could arise we will not attempt to say, but we are inclined to imagine that the locality of the ships in this harbor must be the occasion of it.

Portsmouth Herald.

METHOD

—Is the very hinge of business, and there is no method without punctuality. Punctuality promotes the peace and temper of a family. The calmness of mind which it produces is another advantage of punctuality. A man without punctuality is always in a hurry: he has no time to speak to you, because he is going elsewhere; and when he gets there he is too late for his business, or he must hurry away to another before he can

finish it. Punctuality gives weight to character: such a man has made an appointment, I know he will keep it: and this generates punctuality in those with whom he lives—for like other virtues it propagates itself. Servants and children must be punctual where the master is so. Appointments become debts. I have made an appointment with you; I owe you punctuality, and I have no right to throw away your time, even though I might my own.

THIS IS TO GIVE NOTICE

THAT the Season has arrived for Transplanting FRUIT and ORNAMENTAL TREES, VINES, &c. Those wanting an excellent collection will please call at the New England Farmer Office, and leave their orders, which at one day's notice will be attended to.

GARDEN, FLOWER, and GRASS SEEDS, the best collection ever offered in this market, and orders promptly attended to.

GEO. C. BARRETT.

CHEAP DAHLIAS, CHINESE MULBERRIES, &c.

WM. PRINCE & SONS, near New York, having greatly increased about 350 of their splendid varieties of Dahlias, now offer them at the following very reduced prices, and they are ready to supply five thousand immediately.—

Double Dahlias, 12 distinct named varieties, comprising such sorts as have been most increased, for \$3.

Double ditto, 12 distinct varieties, comprising such sorts as are still more rare and beautiful, \$4.

Double ditto, 12 distinct varieties, comprising such kinds as are yet more rare and remarkably beautiful, \$5.

In addition to the splendid collection which the last season composed their famous *acre bed*, they have just received from Europe, every new variety of great celebrity, and the Amateurs may now have their utmost wishes gratified at reasonable prices to accord with the times. Levick's incomparable, scarlet petals tipped with white, now offered at \$24.

Chinese Mulberry or Morus multicaulis, on their own bottom, and not grafted, at \$25 per 100—or \$4 per dozen.

Just imported 25 bushels New Italian Rye Grass; 50 bushels Pacey's perennial do; 1200 lbs. Finest Provence Luzerne, 100 bushels Potato Oats, weighing 44 lbs. per bushel, and a great variety of other Seeds.

The Chinese Peonies now reduced to following rates—Double White, or Whitley \$1; Humei \$1; Fragrans \$1; the Tree Peony \$4; Papaveracea \$4, and other varieties 25 per cent discount.

200 bushels Orchard Grass at \$24, and 80 bushels Tall Meadow Oats Grass at \$24; 150 lbs. Triplolium incarnatum, a new variety early clover, at 40 cents.

Linnean Botanic Garden and Nurseries.

VOL. XII.

BOSTON, WEDNESDAY EVENING, APRIL 30, 1834.

NO. 42.

AN ADDRESS TO THE ESSEX COUNTY AGRICULTURAL SOCIETY,

At New Rowley, September 26th, 1833, at their ANNUAL CATTLE SHOW.

BY JEREMIAH SPOFFORD.

(Concluded from page 323.)

THE cold seasons of 1812 and 1816, and the intermediate years, produced a disposition in many to abandon their native land, as though nature had changed, and the divine promise of seed time and harvest had failed; but the profusion with which the fruits of the earth have been showered around us for the last fifteen years should teach every farmer to value his soil, to be content with his climate, and never to distrust the faithfulness of Him who governs the seasons.

Alternate showers and sunshine have covered the earth with a luxuriance of fruit which has literally compelled many of you "to pull down your barns and build greater."

'Tis true your lands are not annually enriched by the alluvion of rivers three thousand miles long: nor are your fences and cattle and buildings swept away by the overflow of such rivers. Yet no part of the country is more finely diversified with rivers and streams of water than Massachusetts—than our own county of Essex. Almost every farm is supplied by its running brook—mill streams and rivers of manageable magnitude are found in almost every town; and the majestic Hudson rolls not a more beautiful sheet of water, nor presents banks more luxuriantly fringed with shrubbery, or exhibits finer river scenery than your own Merrimack. With strict truth we may here apply the lines of the poet of the Connecticut:

"No watery gleams through happier villas shine,
Nor drinks the sea a lovelier wave than thine."

From what has been said, and from many other considerations, I conclude that the sons of New England should value their birthright, and wherever their enterprise may lead them in pursuit of wealth or honor, that they have cause to prize the land of their nativity—the land of constant industry and steady habits—the land of "bibles and sabbaths"—the land of red schoolhouses and white churches—the land where slavery is unknown.

"My own green land forever.

"O! never may a son of thine,

"Where e'er his wandering steps incline,

"Forget the sky which bent above

"His childhood like a dream of love."

Although the sceptre of political power may have departed from the "cradle of liberty," and even the seat of empire be already loosening from its foundations for its removal from the Atlantic States; yet the time honored history of the past—the happy institutions and habits of the present day—and the enterprise which is inherent in the sons of the pilgrims—will ever secure New England an honorable place in her country's annals, and as the Jews from every nation under heaven, look towards Jerusalem as the land of hope and promise—so the distant wanderer o'er sea and land, shall in visions or reality return to wander over the happy haunts of his childhood, and lay his ashes on his native soil.

True these opinions would be of more weight if they came from abroad, or from one who had trav-

elled extensively; but these estimates of other parts of our country are founded on the observations of many competent witnesses; and as it is an honor to a child to highly esteem his father's house, so I consider it an honor, a duty and a privilege to do justice to my native soil.

Let us now attend to some of the means essential for the improvement and enjoyment of these advantages.

And one of the first requisites for the improvement of our advantages is—*untiring industry*.

It is often literally true that the hand of "the diligent maketh rich;" but where from any cause it fails to enable a person to gather *heaps of shining dust*, it always in this land enables the diligent to possess constantly and plentifully the necessities and comforts of life, which to every reasonable mind is true riches.

See England, by her active *industry* extending the arm of her power over every sea, and drawing her supplies from the remotest corners of the earth.*

Water and steam and muscular force, are in perpetual action. The very elements are forced to labor, and the island is one vast workshop. Her ships and seamen brave the tempests of every sea, and bring back the riches of every clime. The merchandize of both the Indies congregates in her warehouses, and her merchants are literally princes, and a hundred millions of the indolent Asiatics own their authority, and lay their unwilling tribute at their feet.*

The advantages of industry on a large scale, are also strikingly illustrated by the comfort and prosperity of New England compared with our southern States.

While New England retains habits of *industry* she will prosper under any system of policy which the general government can constitutionally pursue. And though a vacillating policy, and frequent and sudden changes, may embarrass and perplex our commerce and manufactures, yet even that can only diminish the profits of the people, but reaches not the deep laid foundation of New England prosperity.

While on the other hand our southern brethren may threaten or nullify—change the tariff or perpetrate a revolution—they will still find they have not reached the cause of their depression. The absence of voluntary vigorous *industry* is the real cause of the evils of which they complain. A white population ashamed to be "seen with implements of labor in their hands," and a black population doing as little labor as possible, is enough to "nullify" the prosperity of any country. Perhaps some may imagine that it were easy to grow rich where men possess slaves who labor without wages. But let such remember that these slaves are also men, who must eat or they cannot work—that they must be maintained, the old and the young—the sick, the lame and the lazy, with the taskmasters necessary to make them labor at

* Yet notwithstanding the political power and grasping policy of England, the nation is so convinced of the iniquity, impolicy and uselessness of personal SLAVERY, that it is not permitted on her soil, and is about (at a great expense) to be extirpated from her colonies! An example worthy to be followed by our nation, when boasting of its liberty, and proclaiming that "all men are born free and equal."

all, before any surplus can arise to support the luxury of the landlord. Now put a hundred of these laborers, as they would rise from infancy to age, under the care of some hiring taskmaster, while the owner of the whole concern is absent at a horse race, or a barbacue, and what is his chance of a clear profit, for the support of a princely retinue?

Take even a hundred poor people of New England: let the maintenance of them and their children be made sure, thus removing all the stimulus of liberty and property on the one hand, and all fear of poverty and want on the other, and who of you would become bound for their maintenance for all the surplus of their labor? You would much sooner hire the laborers, pay them their wages, and dismiss them to their own cares, when the labor was done.

You will therefore see that slavery lays the axe at the root of the tree of industry, and that indolence saps the foundation of public or private prosperity. Whatever removes the stimulus to industry, whether political, moral, or physical, it is equally ruinous to nations, states, private families, or individuals.

To no class of men does this necessity of constant industry apply more forcibly than the farmer. He turns his own wheel of fortune, more emphatically than almost any other class; those great and sudden turns of fortune which sometimes raise or depress others lay quite out of his track. With firm foothold he climbs the ascent to wealth; or with loosened energies he slides down the gradual descent to poverty.

The eyes of the master or owner must pervade the whole establishment; his mind and his hands must be equally ready to do their appropriate work; his example must be such that no idler can feel easy for an hour on his premises.

Another requisite to prosperity is the systematic plan. Men who have no enterprise to plan, will have still less if possible to execute. Few men do more than they intend to do, and there are or ought to be few who have not ambition enough to rouse all their energies to accomplish what they have once deliberately planned to do.

I would by no means encourage or excite inordinate ambition, but still a desire for property, and accommodation (call it by what name you please) is the life spring of all that is laudable and valuable in society.

The man who is the mere child of circumstance acting only as he is acted upon by his necessities, may enjoy a kind of *Indian tranquility*, but with such men only, the march of improvement must stop in its course, and society fall back into barbarism.

That man who aims at nothing, will certainly accomplish nothing; he that is content with a cabin will never possess a palace; but he that figures to himself the conveniences and elegancies of life, will make exertion to obtain them, and will enjoy at least as much in a well directed pursuit, as in the full possession.

The farmer who is content with a shabby house, wooden fences, and ten bushels of corn or five hundred of hay to the acre, will seldom find himself in a better situation, while he who plans to

possess good buildings, permanent fences, and to see his lands ornamented with fruit trees, and covered with seventy bushels of corn, and three tons of hay to the acre, with life and a common blessing, will certainly accomplish his plans.

You are perhaps most of you familiar with the history of Sir William Phipps, who raised himself from a wood coaster from the then wilderness of Maine, to be knighted by King William, and made Governor of Massachusetts.

He used to say when in his lowest state, that he should live in a brick house in Green lane, (now Brattle-street,) and command better men than he was then thought to be himself—and his own confident perseverance accomplished what he had planned. He had his brick house in Green lane, and commanded in chief the State of Massachusetts. Now all cannot be Governors, nor raise from the ocean a Spanish galleon laden with gold as he did, but all by good plans with industry, economy and health, can obtain that which is just as good, comfortable dwellings, good farms, and a competency of other appendages.

A third requisite for success to the farming interest is that the farmer's mind should be in his business. That man who is above his business, is in danger of soon finding that he has got below it; for no business will long sustain a man when his mind has got above it. That farmer who devotes his mind and his energies to his farm, till it is so far improved that it elevates him above the necessity of constant labor, is the most independent and enviable character in our country; free from the responsibility of office, and the toils and cares of a profession, he eats the fruit he has reared, with more zest than can be realized by any other class. A good farm covered with flocks and herds and fruits, is a truly enviable possession, and like Robinson Crusoe, the farmer is often "monarch of all he surveys."

Another requisite to prosperity, is the keeping of good accounts. Farmers not being under that constant necessity of using the pen which attaches to men of business, are too apt to throw it quite aside; and it is believed have often suffered by trusting to other's accounts, to memory, or to marks on their doors and wainscots.

To record in a book kept for the purpose, all their labor and experiments upon their farms, as recommended by a distinguished agriculturist in your last annual pamphlet, I have no doubt would richly compensate the labor, but it is my present purpose to urge the necessity of keeping a fair and exact account of the date and circumstance of every money or barter transaction between man and man. It would save many of those uncharitable thoughts and hard speeches which often alienate friends, and disturb the peace of neighborhoods.

If every person kept exact accounts of all his debts and credit, law suits would be very infrequent, and our friends the lawyers would be relieved from the disagreeable necessity of sending their uncharitable "Greetings," or writing "your goods and chattels are attached," or "for want thereof take the body." And as I always rejoice when the bodily health of the community is such as to relieve physicians from the care of the sick, to turn their attention to their books, their farms and their gardens; so will I rejoice when the health of the body politic is such, that our much esteemed friends the lawyers, may be entirely relieved from professional cares, to devote their distinguish-

ed talents to employments more profitable to the community.

One more requisite to prosperity you must permit me to name, and that is the disuse of ardent spirit.

I am sorry that I cannot name this subject without exciting some unpleasant feeling; but I cannot, in justice to this Society, or my profession omit to mention a cause which has so long hung like a mill-stone to weigh down the prosperity of the country. No portion of the community have paid a heavier tribute to the distillery than the farmers. Their laborious occupation and exposure to heat and cold, fostered the belief that ardent spirits were necessary to them. But this error is now nearly exploded, and I rejoice that the hour of their emancipation has arrived. Too long have you submitted to a tax which neither you nor your fathers were able to bear—a tax ten times more burdensome than Great Britain ever attempted to impose, when it was resisted by a seven year's war. But what is worst of all is, that this tax is not like the tax on tea, merely collected and carried out of the country, but it returns in another form to curse the payer and make him an idiot and a slave. Here some will object, and say they still use spirits, and have neither spent their property, nor destroyed their intellects. I allow the truth of the assertion; some can bear the expense without serious embarrassment, and regulate their appetites so that they are never drunken. But to such I would say, you incur a useless expense, and encourage by your example your neighbor, who can neither bear the expense nor regulate his appetite. Let me entreat such to change their example to the other side of the question, and lend their aid in drying those tears of heart rending anguish which flow without mixture, where a husband and a father is spending his estate, wasting his time, and converting himself into an idiot or a savage. We have all seen those that thought the same—that they knew what did them good and could govern themselves; that they were in no danger of being drunkards, and resented even the suspicion of danger. But still they are lost, their business neglected, their property spent, their farms mortgaged, their families ruined! I would that this were only imagination, but I know, and you all know, that it is the truth, and that in numerous instances.

But some say this is a land of liberty, and they scorn to be even *persuaded* not to exercise it in every particular.

What a glorious liberty it is for a man to exercise, to leave his business, travel four miles and back, under a burning sun, to vindicate his right to spend twenty cents for rum! to tickle his palate, intoxicate his brain, and burn up his liver—hiding his bottle and hanging his head like a thief when he meets those whom he owes and cannot pay.

My friends, I paint from real life; but I hope such farmers are scarce.

Now, who enjoys real liberty! He who consumes only the produce of his farm, or drinks pure water from the cooling spring, and returns to his labor sober, thriving and independent—or he whose every shilling is mortgaged to the retailer before it is earned—who is too head-strong to be persuaded, and too far gone to make a self-moved and independent resolve to be free? Were I the subject of any government, or the servant of any master on earth who exacted as heavy a tribute as I have seen paid, or as hard service as I have

seen performed, or imposed as heavy sufferings as I have seen endured by ardent spirits, I would resist at the hazard of my life. I would organize a rebellion to the extent of my influence. I would die in the last entrenchment, and ensure the extermination of my posterity, before I would submit to it.

But some farmers yet say they cannot hire laborers unless they give them ardent spirits. This does for an excuse when both the owner and the laborer are desirous to use it; but no man who is firm and unwavering, leaves his crop ungathered for want of help; but hundreds of farmers are now ready to testify that they never had their work done when spirits were used, so easy and so well. Seventy Physicians of Boston have fixed their names to the opinion that ardent spirits are *never* necessary to persons in health; and my own experience in labor and exposure, in cold and heat, by night and by day, confirms me in the opinion, that a dose of spirit is no more necessary in health than a dose of calomel or tartar emetic.

The expense of a gallon of rum a week, to a farmer is no small consideration; in twenty years if saved it would make him a handsome estate, or the want of it may make him a beggar. Whether we therefore consider it on the score of health, morality or expense, it becomes among the most important considerations in the prosperity of a farmer.

Finally, my friends I congratulate you on the prosperous condition in which this anniversary finds your Society. How the exhibition of this day may compare with preceding ones, in its details I am unprepared to state; but that the Society has exalted the standard of agriculture, called into exercise a great amount of female ingenuity, promoted harmony and useful intercourse, diffused the knowledge of useful facts, and exerted a beneficent influence I have no reason to doubt.

The formation and support of societies is among the most efficient means of improvement, in all the useful arts of the present day. It encourages and rewards a spirit of enterprise; it diffuses the knowledge of useful experiments, and introduces the use of important inventions; and tends by multiplying opportunities of social intercourse, to do away those illiberal feelings, and groundless jealousies which often exist between different sections of country, and sometimes even disturb the harmony of towns and neighborhoods.

Some have entertained doubts of the utility of this annual festival, as a useless expense of time and money. Let such remember that man is a social being, that a constant unvaried round of solitary labor is unfitted to his nature, and by no means adapted to the highest development of his intellectual and physical energies. Divines, lawyers, physicians, have their societies, in which they meet to discuss their professional operations, and brighten their minds by friendly collision. Merchants daily assemble on exchange to learn the interests and improve the facilities of trade. And shall the farmers deny themselves a day on which all who take an interest in agriculture can meet on common ground, merely because they do not handle the direct and palpable income of a day's labor? No! Their necessities do not demand it, and the place they occupy in our community forbids the slavish idea.

Societies are found the most direct means of accomplishing almost every enterprise in our growing republic; and annual or periodical festivals,

have the sanction of scripture and the remotest antiquity. The Jewish ritual enjoined a festival and offering of first fruits at the ingathering of the harvest, a day in which they should "do no servile labor." The Romans and the Greeks had their agricultural festivals, dedicated to Bacchus and Ceres, whom they honored as the gods of corn and wine: and it has also the sanction of reason, as the fruits of the autumn fall, to assemble mutually to communicate the result of their labors, and enjoy what has been emphatically called the *farmer's holiday*.

Long may this society enjoy the smiles of heaven. Long may they enjoy the character for industry, sobriety, and morality, which for two centuries has distinguished the farmers of New England. And long may they continue to reap abundant harvests,

"Till the great reaping time shall come,
"And angels shout the harvest home."

COMMUNICATIONS.

For the New-England Farmer. ON THE ACCLIMATION OF FRUITS.

MR. FESSENDEN—Sir, If you think this trifle fit for insertion in your respectable and useful publication it is at your service for that purpose; and I shall be happy to communicate the results of several other experiments progressing at present in my garden when they arrive.

Last spring, a distinguished lover and promoter of horticulture in Boston presented me with seeds of a beautiful flowering biennial plant from Georgia, *Cantua coronopifolia*, which here as well as in Europe has been treated as a tender plant, requiring the protection of glass during winter. It appeared to me from its structure, being covered with a soft down and some other indications, to be a fit plant for an experiment on acclimation;—with this view I proceeded as follows:

10 plants remained entirely exposed during the winter on a perfectly open spot—these are without exception flourishing.

1 plant placed on a grass bank facing the south and protected from the north winds—this is also flourishing, but began to vegetate rather earlier than the preceding, and is now a very fine plant. 10 plants I covered the roots 3 inches with hay, and raised a bank of turf all round 1 foot high 6 inches wide; this I covered with straw; these all died, having perished at the surface of the earth where covered with the hay, the tops still remaining green.

2 plants, I placed in pots and kept in the parlor; these were much drawn or etiolated as the botanists term it; on exposure to the winds last month one was killed, the other remains alive, but is by no means so strong as those which remained exposed, although much taller.

I do not know that physiological botanists have yet undertaken the examination of the structure of plants with a view to their different sensibilities of temperature, and it is certainly a subject rather difficult to approach—but much may be done in this way by the collection of such facts as the preceding.

Besides every addition to the number of hardy flowering plants is an addition to the pleasure of those horticulturists whose means do not place them in possession of glass structures for protecting them during the winter.

Most truly yours, J. E. TESCHEMACHER.
Dorchester, 21 April, 1834.

GRAPES.

As we have many new subscribers who have commenced with recent numbers, we again introduce the subject of Grapes for their benefit.

As it is now well established by experiments, that our climate is well calculated for the cultivation of the finest of the American species of Grapes, and well adapted to produce strong growths of most of the finer varieties of European vines, with corresponding crops of fruit, so long as they can be kept free from that parasitic plant, generally though improperly called mildew.

That the American grapes are capable of making a wine equally as pleasant, as those in common use in France and Germany, we verily believe; but since those vines are little known in this country, as our tastes, and opinions, are made up upon Madeira wines; it is impossible to say how long a prejudice will exist, as at present, in favor of that, as the only perfect wine, and the only wine that it is desirable to imitate. So long as that prejudice does exist, so long we shall either be disappointed in producing the desired article, or if we produce it we shall do it to the injury of the country.

It will be of little use for our temperance societies, to make exertions to banish Brandy from our tables, if Madeira wine is to be used as a substitute, or to prevent the use of pure alcohol and water; if we use the same quantity which only differs in having vegetable extract in it.

The French and German wines are light, and are used to prevent thirst rather than promote intoxication, and as most of them are rather astringent, they act as tonics upon the stomach rather than stimulants of the brain.

Grapes are not only useful for making wine, but are generally preferred to all other kinds of fruit for the table, and there is no good reason why our tables are not supplied with them, eight months in a year, without incurring any very material expense, as a half a dozen vines would be sufficient for that purpose.

The following are the varieties that we should recommend of both American and European varieties.

AMERICAN VARIETIES.

Catawba. Although the Isabella grape has generally been placed at the head of the lists, we put the Catawba, as we consider it superior in many respects to the Isabella. It is shorter jointed, and if possible a better bearer. It endures our winters, and the grapes keep better in jars than the Isabella. As a wine grape it is undoubtedly superior.

Isabella. Second to none unless it is the Catawba, and all its qualities taken into consideration. Grows freely, endures our winters well, is a great bearer, and a fine table fruit.

Bullet Grape. There are several varieties of this grape cultivated under different names, as Muscadine, black Scuppernong, and Muscadell, all meaning a small round grape of dark purple color, rather sour than sweet, with thin smooth leaves, destitute of down beneath, free growers and endure our winters perfectly.

Red Bland. A fine grape well flavored, but the seasons in this vicinity are not sufficiently long to perfect the fruit.

EUROPEAN VARIETIES.

White Frontignac. This is an oblong grape, of good size, large clusters, weighing from one to two pounds, fine flavored, and a great bearer, but the vines, like all other European vines, are subject to mildew: requires a slight covering in winter.

White Sweet Water, or Chasselas. A round grape

of good size, and certainly one of the most pleasant grapes for the table, a good bearer, vines require protecting during the winter. Vines subject to mildew.

Munier. This is one of the hardest of the European varieties, a good bearer, fruit small, and thick set upon the clusters, rather acid but pleasant, color dark purple.

The above mentioned is all that is needed to form the best suite of grapes for table use and making wine.—*Goodsell's Farmer*.

LIME AS A MANURE.

"LIME," observes Mr. Lambert in his excellent work on Ireland, "is peculiarly adapted to land full of weeds and roots, as it decomposes such."—"It is a better manure for wheat probably than any other crop; and the quality of wheat grown on land where it is applied is much improved, having a thinner skin, a better color, and yielding more flour."—"It may be freely applied to land devoid of much calcareous matter."

Lime should as much as possible, be kept to the surface soil: it readily sinks if ploughed in too deep. Though I have mentioned what many may think very heavy dressings of this manure, yet I have known good effects produced from a far lighter quantity: and I would say, it is safer to begin with a moderate dressing, which can always be increased if found necessary, than to over-dose at first. It is essential that the lime should be well slaked, and in a powdery state before spreading. To this end, if the weather chance to be dry, cover up the heaps with mold for a day or two, they will open as fine as if water slaked.—*Gen. Farmer*.

From the Genesee Farmer.

POSTS PLANTED TOP-END DOWNWARDS.

THE 3d volume of the memoirs of the Philadelphia Society for promoting Agriculture, contains an account of some posts *planted top-end downwards*, which were more durable than some others which were set out in the common mode; and understanding that one of our friends had successfully repeated the experiment we wrote to him for particulars. The following is his statement:

"The inverted posts were all sawed from two trees, the logs having had but little taper, and they were sawed wedge shape, consequently one-half were cut each way—that is, the top-ends of one-half were larger, and we set the larger ends in the ground. This was done in the fall of 1817 and the spring of 1818. There were about sixty panels or posts altogether, which were taken up in 1830-31-32. From my best recollection about one-third of those that stood butt-end down were in *tolerable preservation*, while of those inverted, about two thirds were in better preservation than the one-third just referred to; and a number of them, except half an inch on the outside next the earth, were quite sound, and decidedly in better condition than any of the former kind."

From the account given in the memoirs we learnt that the inverted posts were forked or knotty; and these are the most durable parts of the timber, we thought rather lightly of the discovery. The evidence which we now present to our readers however, is more pointed than anything else that we have seen on the subject; yet we do not understand why one-third of the inverted posts, and two thirds of the others, should be more decayed than the rest: and we should be better satisfied with an experiment on posts sawed from one single log or out of straight grained timber.

From the Northern Farmer.

UNFERMENTED MANURE.

In the last number of the Farmer, I noticed some remarks in relation to the subject of manures, as published by the editor of the New-York Farmer, "in which he has maintained, that the practice of applying rotted manures is better supported by science, than that of applying them in a fresh and unfermented state;" and that the practice of making use of unfermented manures is also condemned by the Edinburgh Quarterly Journal of Agriculture, as first introduced by Sir Humphrey Davy.—Now, it matters not with me, whence the doctrine originated, respecting the use of fresh or unfermented manures; so long as the superior advantages to be derived from their use, for all purposes of field cultivation, are so strikingly manifest, as I think they have been, since I commenced their use, which is not less than twelve or fourteen years.

The first, and perhaps *not the least* advantage, to be derived from the use of manure in its fresh or unfermented state, is, the saving in quantity, of at least, in my judgment, one third; and in strength and value of the manure, nearly as much more. I think I have not overrated the injury suffered by manure, when it is permitted to remain in the farm yard, and at stable windows in heaps, exposed alternately to the scorching rays of the sun, the drying winds, and drenching rains of summer, as is the practice with many farmers. Another advantage in favor of the use of unfermented manure, is, that while all crops, to which I have applied it, have ever been uniformly as good, as when I used old, rotted manure; and potato crops much better; its effects have been more durable, and succeeding crops have been more benefited by it.

Unfermented manure from the barn-yard or stable window, has generally been considered as unsuitable for the corn-hill; and, I am not prepared to say, how far it may be advantageously used for this purpose, as I have not sufficiently tried the experiment, fully to satisfy myself on this point. I have for the last five or six years, made use of unfermented manure from my hog-pen, in the corn-hill; and, have found it to be superior to the fine summer dung from my barn-yard. From these two sources, I have usually obtained sufficient manure to dress from two and a half to three acres of corn in the hill, annually, about one third part of which has been taken from the hog-pen.

From rather an accidental discovery of the value of coarse strawy manure, from the hog-pen, I shall be disposed hereafter to make it an object to increase the quantity from this source as much as possible. Last Spring [1833], I planted about three acres of corn which I manured in the hill, the largest portion of it with fine summer dung from the barn-yard, drawn to the field in the Fall and deposited in a heap. The remainder of the field, say about one third, was dressed with fresh manure from the hog-pen, and placed in the hill as soon as it was removed. About one third of this manure, which was four loads at the bottom, was composed of straw, brakes and weeds, and such other vegetable matters as could be obtained from my farm, and when taken out of the pen, was apparently as coarse and unrotted, as when put in. This, however, was all carried out and placed in the hills. The ground had been planted to corn the year before, without any manure, having been grass ground turned over late in the Fall, and no manure was applied to the crop in question, except

in the hills as before mentioned. The ground was a ridge of gravelly loam, and from the growth of the crop; the first year [1832], it appeared that the ground on the highest part of the ridge (the rows of corn running parallel with it,) was not in so good a condition to produce a crop of corn, as it was on either side, at a short distance from it. My corn-rows were again planted in the same direction; and it so happened that that portion of the coarse, unrotted materials, (for I could not as I thought at the time, call it manure), from my hog-pen, was placed in the hills of eight rows, directly along the highest elevation of the ridge, where, the year before the corn had been much the smallest of any in the field. Under these circumstances, I expected nothing more favorable from these rows, in the last, than in the former crop. I, however, covered the coarse manure in these eight rows, with four or five inches of earth, before dropping on the seed to prevent it from becoming too dry, and then covered the seed the usual depth.

The corn came up well, and stood very even over the whole field. I soon discovered, though contrary to my expectations, that the corn in these eight rows was gaining on that of any other part of the field; and at the time of weeding it was manifestly the largest of any in the field. It held on growing in the same manner, through the season; and at the time of harvest, I think there must have been nearly one fourth more corn on these eight rows, than on the same number of rows, in any other part of the field.

From these facts, I am induced to believe, that unfermented farm-yard, or stable manure, may be applied, in the hill, to the corn crop, with advantage; provided the ground be deeply furrowed, and the manure buried sufficiently deep, before dropping on the seed, to prevent the roots of the corn from reaching it too soon; or before it shall begin to ferment—after which, it will be admirably calculated to throw the corn forward, and furnish the support necessary to this crop, at the time it is filling out.

I intend trying a small piece for experiment, in this way the coming season.

Should you think the above remarks of sufficient merit to obtain a place in your valuable, and to me interesting paper, I may, perhaps, hereafter be induced to offer something further on other branches of husbandry.

MATTHEW BUELL, JR.

From the Genesee Farmer.

FARMERS' GARDENS.

My caption may startle such as have been content, the greater part of their lives, with salt pork and potatoes, with the addition now and then of a few greens from the field, or a little lettuce. If the perusal of this article shall be the means of reducing the number of this description of farmers, my end will be answered. I know of no class of citizens that would suffer by the change, except the physicians.

It is amusing to see with what avidity our settlers from the land of steady habits, will as soon as vegetation springs, search for the dandelion; and yet these men consider it lost time to devote a few hours in each week to preparing, planting and tending a garden, that would half support their families, and save many a physician's bill.

It is a duty which each farmer owes to his family, and not only so, but his interest, to provide

them with a variety of vegetables for the table. It adds not only to their health, but to their comfort, and greatly reduces the consumption of animal food! It is also a duty he owes his sons, to employ them every leisure hour in the garden, to instruct them in the cultivation of the different vegetables, and at the same time to impress on their minds the important truths, that every hour should be profitably employed; and that a man's garden is a pretty good index of his mind. When I see a garden well fenced and well cultivated, I draw the conclusion that the owner is a man of taste and of good feeling.

But some may say, "I cannot attend to a garden without neglecting my farm." I appeal to such, whether there are not many hours in the course of a week, that might be spent in the garden, without any neglect of the farm. Our teams must have time to rest and feed; and we often finish a job an hour or two before night, when it would be unprofitable to begin a new one; then say—Now boys, let us go into the garden.

Instead of hunting in the fields, on the opening of spring, for a few greens, to be able to go to the garden, and gather a mess of spinnage, asparagus or lettuce—or when the season is a little advanced, a mess of early peas, string beans, early beets, squashes, and a variety of other summer vegetables, must surely afford gratification to the farmer. But when, in addition to these, he has in autumn buried in sand in his cellar, a sufficient supply of parsnips, carrots, salsify, beets and cabbage for the consumption of his family through the winter, with a cart load of Rhode Island crooknecks secured in a dry place, he surely may take more comfort than he could with potatoes alone, even if the latter were the best kidney or pink eye.

If he have all these good things, he will not be satisfied until he has set out a long row of currant bushes, and two or three Isabella grape vines; nor till he has yielded to the solicitations of his wife and daughters, to have a piece of well prepared ground assigned them for parsley, sage, &c. with a few roses and other embellishments, suited to their delightful taste. ONTARIO.

POTATOES.

BEING something of a *Murphy*, we obtained five or six kinds of potatoes last Fall, in order to ascertain which were the best, taking the season through, and our verdict is decidedly in favor of the *Pink Eyes*. They are now neatly and white as the best Genesee flour. Perhaps no potato can be found which *keeps* better. They are not so early as the *Cheungoes* or *Philadelphias*, but they are superior in quality, nearly or quite equalling the *Butmans*, and *yielding* twice as well. Farmers who are about planting would do well to try them.—*Kennebec Journal*.

MEANS OF RENDERING THE VINE MORE PRODUCTIVE.

A FOREIGN journal of some ability, recommends four ounces of alum to be mixed with four ounces of clay, by means of a sufficient quantity of water, and the roots of the vine being uncovered on a fine day, towards the end of winter, they are to be moistened with this mixture, and the earth then changed, so that what was previously uppermost shall be undermost. Through this operation a vine produces a greater quantity of grapes.—*Goodsell's Farmer*.

*From the Genesee Farmer.***CULTURE OF MELONS.**

In the Genesee Farmer of the 18th ult. there is a communication from W. W. B., stating his want of success in the cultivation of melons. Perhaps I may be able to suggest a plan by which he will not be liable to such a total failure in future, though I should suppose that in your latitude there was not much certainty in bringing this delicious fruit to perfection. I would recommend him to select the lightest spot of ground in his garden, and at suitable distances, say eight feet apart, dig holes about thirty inches square and eighteen inches deep. In these holes put some well rotted manure, which must be well mixed with the soil, until they are nearly full. The soil should be entirely clean of grass or grass roots, and completely pulverized. A sufficient quantity of the same kind of earth should then be thrown on to raise a hill to a moderate height above the general surface of the ground. If these directions are followed, and the sub-soil be not of such tenacious quality as to retain much moisture, I think a fair crop may be reasonably calculated upon. An additional advantage would be derived from digging the holes in autumn, and letting the earth thrown out, remain until spring to be ameliorated by the frost.—This is the mode pursued by some of the gardeners who supply the Richmond market with melons, and I have found it to succeed better than any other I have tried. I will, however, mention an experiment I made last year, the result of which was favorable beyond my expectations. I raised a few plants both of the watermelon and the cantaloupe in a box, which came up very early among other plants. I transplanted them into a rich, well prepared spot of ground, that had been spaded very deep, being careful to take them up with as much dirt round the roots, and with as little injury to the fibres as possible. They grew well, were not infested by bugs, being too large to be much annoyed by them—and yielded a remarkably fine crop, both as to number, size and quality. If this operation is performed well, and the young plants kept moderately watered if the weather is dry, I incline to the opinion that this will be found to be a very eligible way of raising the melon. By this means we may also have the plants in readiness to set out so as to be greatly in advance of those planted in the open ground; for the earlier they get a start the more certain will be the crop. The seeds may be planted at once, and the transplanting done as soon as the danger from late frosts is over. T. S. P.

*Beaverdam, (Va.) 2mo. 3, 1834.**From the Newburyport Herald.***HORTICULTURAL.**

Mr. Allen—I take the liberty through your excellent paper, to inform the members of the Newburyport Horticultural Society, that Zebedee Cook, Esq. of Boston, Vice President of the Massachusetts Horticultural Society, and whose kind attendance we have several times experienced, has sent to his relation and friend Capt. Hector Coffin of Rock Farm, a number of scions of the best varieties of Pears in the neighborhood of Boston, for the use of the members of our Society. Capt. Coffin has added to them a list of scions of very fine Apples from his own farm. There are also scions of Pears from the garden of Gorham Parsons, Esq. and Mr. Winship of Brighton. The members of the Society may be supplied by calling at the store of Mr. Ths. B. White. A LOVER OF HORTICULTURE.

*From the Northampton Courier.***AGRICULTURAL.**

At the annual meeting of the Hampshire, Franklin and Hampden Agricultural Society, Joseph G. Cogswell was elected President; Messrs. Samuel Lathrop, Caleb Rice, Dr. Elisha Edwards, Roswell Hubbard and H. G. Bowers, Vice Presidents; Messrs. J. H. Butler, D. Stebbins, Secretaries; and Samuel L. Hinckley, Treasurer; Messrs. Stephen Brewer, Elias Winchell and Jonathan Hunt, Committee on Household Manufactures; Messrs. Edward Parsons, James Kent and Henry Parsons, Committee of Arrangements and Agriculture; Messrs. Henry Kent, Walter Cooley and Benjamin Ashley, Committee on Animals.

Voted, That the next annual Show and Fair be holden at West Springfield.

Due notice of the time and place for depositing Manufactures, &c. will be given hereafter.

Attest, J. R. BUTLER, R. Secretary.

SHORTENING ROOTS.

SEEDLING plants that are designed to be removed, should be taken up, either in the fall or spring, and set out preparatory to their final transplantation, in order to cut off their long deeply penetrating roots, and cause them to send out a greater number near the stem. In case it is not convenient to take them up, cut off the tap and long horizontal roots, by thrusting in the spade, without lifting the plants. If done in the fall, they can be the more safely transplanted in the spring.—*New York Farmer.*

COMPRESSION OF WATER.

MR. JACOB PERKINS has invented an apparatus, which, by hydrostatic pressure, compresses water to an extent equal to a fourteenth part of its volume. The force employed is equivalent to a pressure of 300,000 lbs. to the square inch, and is applied to other fluids. In most of our works on natural philosophy, water is treated as incompressible and non-elastic; by this apparatus the opposite of these two propositions is clearly shown.—There was a considerable difficulty in getting a vessel capable of resisting so high a pressure; and the chief feature of this instrument is the manner of constructing the cylinder, which is formed of a series of concentric tubes: thus the inner or smaller tube is first formed by welding, and is turned accurately on the outer surface; the next tube is then formed, and is accurately turned on the inner surface, and the bore of this second or outer tube is just too small to receive the first tube, but, in order that it may do so, it is heated, till, by expansion, it is capable of receiving the first tube within it, and in cooling, the second tube shrinks on the first tube and strongly embraces them together; a third tube, a fourth, and so on, are similarly put on, till a cylinder is produced capable of withstanding any pressure.—*Repertory of Inventions.*

MANUFACTURE OF SILK.

GAY & BOTTOM of Lisbon, Connecticut, have invented power looms and other machinery for the manufacture of American silk into cloths. We are happy to hear these spirited manufacturers say that they want no protection, not even that which would arise from a revenue duty on foreign fabrics. What our silk growers need is a market, and that can only be furnished to sufficient extent, by the successful manufacture of the raw material into a great variety of articles of use.—*N. Y. Jour. Com.*

WORCESTER AGRICULTURAL SOCIETY.

At the Annual Meeting of the Worcester Agricultural Society, holden at the Exchange Coffee House in Worcester, on the 17th inst. the following officers for the present year were elected:—

President, Levi Lincoln—*1st Vice President*, Anron Tufts—*2d Vice President*, Silas Holman—*Treasurer*, Theoph. Wheeler—*Corresponding Sec'y*, Oliver Fiske—*Recording Sec'y*, Wm. D. Wheeler.

Trustees—Barre, Daniel Bacon, Seth Caldwell; Bolton, Stephen P. Gardner, Amory Holman; Boylston, Nathaniel Brigham; Brookfield, Edwin B. Taintor; Charlton, Salem Towne; Dudley, George A. Tufts; Grafton, Samuel Wood, John Batcheller; Hardwick, Samuel Billing; Harvard, Jacob Haskell; Holden, Samuel Daman; Lancaster, John G. Thurston, Joel Wilder; Leicester, Isaac Southgate, Joseph D. Sargent; Leominster, David Wilder; Lunenburg, Edmund Cushing; Mendon, Benjamin Davenport, William S. Hastings; Milford, Sullivan Sumner; Millbury, Elisha Jacobs; New-Braintree, Samuel Mixer, Amory H. Bowman; Northborough, William Eager; Northbridge, Sylvanus Holbrook, Paul Whiting; North-Brookfield, Francis Carruth; Oakham, James Allen; Oxford, Jonathan Davis, Jr.; Paxton, Nathaniel Lakin, Jonathan P. Grosvenor; Petersham, Jared Weed; Princeton, Jacob W. Watson, Benjamin Harrington; Royalston, Rufus Bullock; Shrewsbury, Henry Snow, Silas Allen, jun.; Spencer, James Draper; Southbridge, Ebenezer D. Amudown; Southborough, Jonas Ball; Sterling, Moses Thomas, Stephen Hastings; Sutton, Daniel Tenney, Israel Putnam; Sturbridge, Erasmus Holbrook; Uxbridge, Joseph Thayer, Effingham L. Capron; Westborough, Charles Parkman; Worcester, John Davis, Thomas Chamberlain, Nathan Heard, John W. Lincoln, Rejoice Newton, Samuel B. Thomas, Lewis Barnard, Stephen Salisbury.

It appears by the account of the Treasurer, exhibited at this meeting, that the funds of the Society now amount to \$7,495.31, of which sum, \$3,000 is in Bank stock, and the remainder in good notes well secured. The renewal of the grant from the State for the encouragement of Agriculture enables the Society to continue their Cattle shows and exhibition of Manufactures, and a list of premiums to be awarded next autumn for the best of the products of the Farms and Workshops of the county of Worcester, will soon be published by the Trustees. Neither shall the ladies be neglected or forgotten. The Society considers itself much indebted to the fairer part of the community for the interest and embellishment of their shows—and knowing that they are never weary in well doing, the Society with confidence call upon the ladies, *not to forget us next fall.*

The Society would make an earnest appeal to all the present members, individually, to endeavor, by removing prejudices, if there are still any existing, and by the use of all proper measures, to increase their number, and thereby their means of usefulness, in the promotion of the objects of the Society. They confidently believe the Society has done much good. It is their desire to augment the number and amount of premiums. This can only be done by increasing the amount of their funds. And the Yeomanry of the county are invited to join us in our endeavors to promote the interests of agriculture, manufactures and the mechanic arts, by giving the Society their names, and their influence.

April 19, 1834. By order of the Society.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, APRIL 30, 1834.

SPRING WORK.

Ploughing. It is a good general rule to plough in the fall most of the land which you propose to till. Jack Frost, Esq. with his tiny pincers and invisible pulverizers will do more toward subduing a rough and rugged soil than can be effected by all the implements of husbandry. But in many soils, fall ploughing is not to be recommended. A light sandy land, which is naturally too loose for vigorous vegetation, is injured by late fall ploughing. The frost destroys the little adhesiveness which it ever possessed, and its most fertilizing particles are swept away by winds, or washed off by floods. Such soils should be kept coated and bound together by vegetation as much as possible. In ploughing land of any description, but more particularly a light soil, care should be taken to draw the furrows as nearly level, or horizontal as possible. Without this precaution, every furrow will become the channel of a water course, by means of which the best of your soils will be apt to take French leave of your premises. If your land is light and sandy, it will be highly important to turn the furrow quite over and leave it as flat as the narrative of a long-winded storyteller. Then complete your work by harrowing so as to fill the interstices between the furrow slices, and passing a heavy roller over it, your soil will then, probably remain with you, instead of being off by wind or water. But if the land is of a stiff, heavy and adhesive nature, the furrow slices should not be laid so flat as to prevent the air from pervading their sides and lower parts. The depth of ploughing should be regulated by the kind of crop prepared, the depth of the sod and the means of improving it. It is wrong to turn up at once a great body of hungry earth, unless you have plenty of manure with which to feed it. A soil naturally shallow should be made deeper by degrees, and no more barren earth be turned up by any one operation than you have the means of enriching by manure. Spring wheat is a very good crop with which to sow clover and other grass seeds. It is well to plough and harrow it in with your spring wheat, you will please to allow not less than about twelve pounds of good clean clover seed, and as much as a peck of herds grass, alias timothy, to an acre, you may as well sow grass seed in the spring on winter wheat or rye, and harrow it in. Although some plants of the grain may be torn up by the teeth of the harrow, the remainder will receive so much benefit that the balance will be much in favor of using the harrow.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FRUITS.

Saturday, April 26.

By Mr. Hoyt of Gilford, N. H. Russet apples from a tree raised by him from seed, a fruit of medium quality, valuable for their late keeping.

By Joseph Morton, Esq. of Milton, Tolman's Sweeting, fine and productive for the table and baking.

By D. Fosdick, Esq. of Charlestown, Sweetwater Grapes preserved in oak saw dust, they were in a good state of preservation, and the flavor equal to the imported grape.

For the Committee, ROBT MANNING.

GRAPE VINES.

LET that farmer who has not a good grape vine about his house, mount his horse and go a journey of some 10, 50, or 100 miles to obtain an Isabella, Catawba, or some other choice native vine. It should make a farmer blush, in these days to be compelled to say, he has no vine to sit under. It implies that he is slow in availing himself of the proffered blessings of Providence—that he cannot think much of adding to the comforts and pleasures of his wife and children.—*N. Y. Farmer.*

ASHES.

A correspondent informs us, that from his own experience, and the opinion of the best farmers, he is satisfied that a bushel of good ashes is worth a bushel of corn, to put on corn, flax grass or a garden: and he is surprised that any person should continue the practice of selling ashes for pot-ash, at the trifling price of 8 or 10 cents a bushel.—*Hampshire Gazette.*

BREAD.

It is not generally known that the best and finest bread must contain both alum and potatoes. To five bushels of flour there must be 28 pounds of alum and a bushel of potatoes. The alum is ground in with the wheat at the mill, and the potatoes are boiled by the baker's servants and rubbed unpeeled through a sieve. Without these ingredients the bread would neither be white or light: so that not only does a great profit induce the usage, but the improvement of the article for sale requires it. The bad taste of the alum is taken away by the fermentation of the dough. Sometimes instead of yeast which is occasionally very difficult to procure sweet the great bakers use volatile salts, with which they ferment some of the dough, and that ferments the rest without any yeast. The above mentioned quantities of flour, alum and potatoes, will make 80 quarter loaves, and the quantity of potatoes accounts for the fact that excellent bread can be got from the bakers cheaper than it can be made at home.

ITEMS.

Grass seeds. It is very probable that the farmers of this country, in confining their attention exclusively to clover and timothy, do not realize as much hay and pasture as they would from a greater variety sown in the same field. In England the quantity sown to the acre for mowing is ten pounds of red clover, two of white do., two of yellow do., and one bushel of perennial rye grass. In this country grass seed is not generally sown later than the 15th of April.—*N. Y. Farmer.*

Botts in Horses. This is the season in which these worms are injurious to horses. Horses that have their food frequently seasoned with salt are said to be less liable to injury from them. Since botts seem to be fond of sweet liquids, it may be an advisable precaution to administer molasses with their food.—*Genesee Farmer.*

The Chinese Mulberry. We should advise every farmer to obtain at least one of the *Morus multicaulis*. It will not cost more than fifty cents; and by taking cuttings or by laying, he may next spring have some ten or twenty plants.—*Genesee Farmer.*

Young Turkeys. No kind of domestic fowl sell better than fine turkeys; and yet comparatively few are raised in proportion to the numbers hatch-

ed. It is recommended to keep them from wet, and to feed them on homony and chopped onions.—*N. Y. Farmer.*

Grubbing. The manner in which I cleared a piece of ground grown up in bushes and undergrowth of various sizes from three to ten feet high was with a pair of oxen and a chain of ten to twelve feet long, with one end attached to the yoke, and forming a noose with the other around as many of the sprouts as could be encompassed by it, which when thus made fast, they drew out by the roots with great ease; it was in the spring while the ground was yet loose: it is probable the operation would not be so easy when the ground is dry and hard. Two active boys of fifteen years of age, will clear more ground in this way, than ten men will grub out in the ordinary method with mattocks.—*American Farmer.*

ITEMS OF INTELLIGENCE.

A fossil ship containing skulls and bones, both human and brute, has recently been discovered at New Romney on the coast of England. The earth has been removed so as to display her whole form, a clinker built craft, and trunnel fastened, having only one mast, being 54 feet long by 24 wide. Curiosity has been much excited by its development.

Four Banks Failed. The Bank of Washington and the Patriotic Bank, in the city of Washington, the Farmers and Mechanics Bank at Georgetown, D. C. and the Alexandria Bank, have all stopped payment within a few days. They are declared to be solvent, but unable to withstand the pressure of the times.

From the Register kept in Shelburne four miles west of this village, we learn that during the last winter, there fell in that place between Nov. 26 and Dec. 24, 50 inches of snow, a very unusual quantity. In Ashfield, Heath, and Rowe, towns lying higher and farther west, there fell from 18 to 24 inches more during the same space of time. In Shelburne, there fell from Dec. 24 to March 25, at five different times, 22 inches more, making 75 inches in all.—*Greenfield Mercury.*

A Distressing but common Circumstance. A few days since a Mrs. Robinson, wife of Mr. Barnabas Robinson, of Sheridan, in this county, left her child aged six months upon a cotton blanket on the floor, while she left the house for a few minutes, and on her return she found the blanket and child's clothes on fire, supposed to have taken by a coal snapping upon them. The child was so severely burned that it died on the third day. We might here add the usual caution against thus leaving helpless children alone where there is a fire, but it would probably have as much effect as the hundreds that have been given before.

Cure for Polypus. A writer in a foreign periodical relates that an obstinate case of polipi of the nose of long standing was cured by applying laudanum with a hair pencil to the polipi.

Mr. Isaac Edwards, of Penntownship, in the western section of Chester county, informs us that he disposed of 211 lbs. of butter, from four cows, in the space of eleven weeks in the early part of last season: besides furnishing the ordinary supplies of a family of from four to seven persons.—*Westchester Village Record.*

Last year on the opening of the canal, there was at Albany ready to be forwarded, 2975 tons of goods from New York. This year, alas! there is only seven hundred tons.—*N. Y. Star.*

The Meteoric Phenomena. Professor Olmstead of New Haven, has offered an ingenious hypothesis to the forthcoming number of Silliman's journal, on the subject of the extraordinary shower of meteors during the last fall,

Nov. 13. He considers them *nebulous* body or cluster, moving in an orbit round the sun, within that of the earth. He estimates the time of their annual revolution at 182 days. At the time when seen, some of them must have approached so near the earth as to fall within our atmosphere, which caused their combustion, and thus rendered them visible. It is a singular fact that the great meteoric phenomena in 1799, appeared Nov. 12th, and most of these sublime exhibitions in the movement of the heavenly bodies are said to have occurred in this month—*Eastern Argus*.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, $\frac{5}{8}$ miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, Moutan and Papaveraceæ—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

MACHINE FOR CUTTING FODDER.

THE simplicity of the construction of this Machine, and the small probability of its getting out of repair, together with the neat and rapid manner that it performs its work, certainly renders it a desirable article for the purposes for which it is intended. It is constructed on an entire new principle from any heretofore invented, and will cut an hundred weight of hay in ten minutes, two inches long, can also cut any length from three inches to one-fourth of an inch; it is fed by placing the fodder in a hopper that stands perpendicular, the knife playing horizontally underneath, by which means all the complicated machinery for feeding and the power necessary to drive it is avoided.

The Subscriber having become the proprietor of the right of making, &c. said machine, in and for the State of Massachusetts, solicits the public to call and examine for themselves. Said Machine is for sale at the store of PROUTY & KEARS, No. 12 Commercial street, Boston. DAVID P. KING,

Who is also Agent for the States of Vermont, New Hampshire, Maine, and Rhode Island.
a 2. eow6w

PIE PLANT; or, Rheum Rapphonticum.

This valuable vegetable is a perfectly palatable acid, and answers most of the purposes that apples or other fruit do to cook, preserve, or dry for winter use. The stems of the full grown leaves of this plant are at all times fit for use; they require no other preparation than washing and cutting into short pieces, and are then fit to make pies, tarts, dry, or preserve, the same as apples. The leaves are frequently from two to three feet wide, and four feet long. To have this plant produce in perfection, sow the seeds on a rich spot of ground; water them frequently in dry weather, while the plants are young; in the fall or spring following, prepare a spot of ground eighteen inches deep, and very rich with rotten manure, on this, set out the plants four feet apart each way. One plant well cultivated at three or four years old, will produce in one season, from thirty to forty weight or upwards, fit for use.

A few papers of the seed of this plant received and for sale at the New England Seed Store. GEO. C. BARRETT.

GARDEN AND FLOWER SEEDS.

An excellent collection of GARDEN and FLOWER Seeds of very best quality, in papers of 61 cents each, constantly on hand and for sale at New England Seed Store of

GEO. C. BARRETT.

THE IMPORTED HORSE PHOENIX.

The imported thorough bred English entire Horse Phoenix six years old last June, is offered for sale. He was sired by Antonio, dam by Conus. He has proved a sure foal getter, and his colts are very promising—and is believed to be as fine a horse as ever was offered in this market for Sale, and well worth the attention of those who feel interested in the improvement of the breed of horses. This Horse may be seen at Mr. Gilson's Stable, Hawley Street, where further particulars will be given. 2awis ap 30

SEEDS.

Just received direct from Holland, a large assortment of CABBAGE SEEDS, in small and large quantities. These are from a House upon which the utmost reliance can be placed, and the quality of Dutch Seed is found superior. a 30 GEO. C. BARRETT.

C. G. GREENE'S

IMPROVED SILK REEL.—PRICE \$20.—For sale at the Agricultural Warehouse, No. 52 North Market Street, and by the Patentees, Windsor, Vermont. ap 23

GRAPE VINES AND PEAR TREES.

FOR SALE, a few Grape Vines, plants 3 years old, at the Garden of S. G. PERKINS, Brookline, viz.—

White Chasselas or Muscadine, Purple Muscat,
Red Chasselas, Red Constantine,
Black Hamburg.

Also, a few Pear Trees.—Dwarf, Duchess of Angouleme. Apply at the Garden to Mr. ROBERTS, or to Mr. PERKINS at his Office. ap 16

SWEET POTATO SLIPS.

THIS day received from New Jersey, a quantity of SWEET POTATO SLIPS in fine order, and will be sold in large or small quantities if applied for soon. GEO. C. BARRETT, ap 6 New England Seed Store.

WHITE DUTCH CLOVER.

RECEIVED this week direct from Holland 1000 lbs. superior White CLOVER, warranted free from any kind of foul seed, and at least worth one third more than American. This will be found an excellent Grass for Pasture land, &c. a16 GEO. C. BARRETT, New England Seed Store.

PAINT OIL.

The subscribers keep on hand a constant supply of their "Prepared Paint Oil," which is offered for sale with renewed assurances of its merit. This Oil, independent of being 25 per cent. cheaper in price, will actually cover a quarter more surface, as has been repeatedly proved and confirmed by statements of many Painters. Upwards of 200 buildings in this city and vicinity can be referred to, many of them painted two years ago, which continue to look well, and retained their gloss through the first year, which is a clear demonstration of its strength. The Prepared Paint Oil is found to answer a valuable purpose to mix with Linseed Oil, giving it strength and durability with a more permanent gloss. It paints a very clear white, flows smooth, and is more free from milldew, and changes resulting from the sea air, than any other Oil. Oil Factory (head Foster's Wharf.)

DOWNER & AUSTIN.

P. S. Please be particular to order Downer & Austin's "Prepared Paint Oil." m 19 6pis.

MANGEL WURTZEL SEED.

300 lbs. Mangel Wurtzel Seed, raised from selected roots and not imported. This article cannot be too highly recommended for Stock, yielding 40 tons to the acre, and being a most profitable crop. Sow 2½ lbs. to the acre. For sale at New England Seed Store. GEO. C. BARRETT.

BRIGHTON MARKET.—MONDAY, April 28th, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 300 Beef Cattle, (including 30 unsold last week,) 10 pairs working Oxen, 12 cows and calves, and 200 sheep.

PRICES. Beef Cattle.—In consequence of the cool weather, and the limited number at market, prices were considerably advanced, particularly on some qualities. We noticed a few pair very fine taken at 5 88; we quote prime at 5 50, a 5 75, good at 5 25, thin at 5.

Working Oxen—No Sales noticed.

Cows and Calves—Sales were noticed at 23, 26, 28, 30, and 33.

Sheep—We noticed one lot taken at 5 33; one at 6, and one at 57.

Swine—None at market; a few purchasers were considerably disappointed.

SPRING RYE.

JUST received a quantity of Spring Rye, at New England Seed Store.

MISCELLANY.

From the Village Post.

LAND-BREEZE BETWEEN THE TROPICS.

"The forests of Brazil are filled with aromatic plants, whose perfumes are often wafted many leagues to sea."

To the billow-borne pilgrim
Alone on the seas,
How sweet comes the perfume
Of land, with the breeze!
'Tis the breath of a summer
Eternal in prime;
The kindest fragrance
Of sun-gladdened clime!

Those wanderings of sweetness
How welcome they are!
That tell of a country
Unseen and afar:
Like the morning, their advent
Aye ushers a smile;
And the rover's heart dances
In joyance the while.

To cheer his lone vigil
At midnight, they tell
Of meadow and mountain,
Of forest and dell—
Till his eye o'er the ocean
Forgetteth to roam,
And he walks in his slumber
The fields of his home.

Thus oft on life's billow,
With bark tempest driven,
The voyager fancies
The breathings of HEAVEN!
The past and the present
Remembering no more,
He greets in his vision
The world that's before.

C.

From the Nantucket Inquirer.

THE CREDIT SYSTEM.

THE novel, striking, and philanthropic idea advanced by our excellent Governor in his first message to the Legislature—viz. that the laws authorizing imprisonment for debt are in themselves absurd, since they exempt the poor man's tools of trade from seizure, while they sanction the incarceration of his body—as though the implements could work without hands—it is gratifying to perceive, has aroused our law makers to a sense of long-neglected duty. To their honor they have adopted that liberal policy, and those rational views, in regard to the practice of punishing poverty as a crime, for which the more enlightened and humane among the citizens of this commonwealth have for many years contended. It remains now to be proved, by experimental application of the statutes for abolishing imprisonment for debt, and for extending the jail limits, whether the great benefits promised to society by those who have advocated this change, shall be realized.

One salutary effect, that may be confidently anticipated, is the gradual substitution of a more direct as well as safer mode of transacting ordinary business between man and man, for the *credit system* hitherto so much in vogue, often so ruinous, and upheld only by the formidable image of a dugeon. The introduction and establishment of this new mode, cannot but operate advantageously on a large majority of the people—on the middle and laboring classes especially. Men will acquire the habit of paying as they go; and if men mean to be honest, they may as well pay first as last. This

habit, and this ability, will become more and more easy as the system of trading or laboring for prompt pay approaches to universality of adoption.

Moreover, it will promote frugality. People with money in hand, are generally careful in their purchases, and scrupulous to get their money's worth; while those who can be accommodated with a distant day of reckoning, are not only apt to increase their responsibilities unnecessarily, but are very often subjected to gross impositions in the first place, and ultimately immense trouble and distress. A man buying on credit in a small way, is rarely over particular in the consideration of those points which belong to a good bargain; he neither searches the market, examines the quality, nor asks the price, with that degree of prudent discretion which commonly marks the dealings of one with cash in hand. This is human nature perhaps: at all events it is a fact founded in experience.

Another good effect—of a moral character—may be expected from this improvement. Things will be oftener called by their right names. The swindler and the unfortunate will not so frequently be confounded, and thrown undistinguished into prison. A knave who deserves the pillory, is sometimes let off with the simple penalties hitherto inflicted on poor debtors. Those whose business it is to punish the rogue, contrive to satisfy their sense of justice that his doom is sufficiently severe, though it be no greater than that suffered by the defaulter whose culpability arises from no moral guilt. But truth and justice demand a different course towards these individuals relatively. If loss of personal liberty be the legal forfeiture denounced upon innocent penury, the same measure of punishment is not enough for the chastisement of fraud and imposture. The villain who cheats the widow and orphan, has too often been suffered to escape as a mere debtor; and as such has obtained that sympathy which only misfortune should claim. The welfare of society, as well as the cause of justice, requires an exposure of every crime under its proper name and character; and men should boldly hold up such examples to public detestation, rather than extenuate an actual offence against virtue and law, by softening its quality for the mere sake of obtaining individual satisfaction. Henceforth, then, by the aid of our new system, let full retribution be exacted of the knave and swindler; while the honest man, though poor and disabled, is still sheltered and protected by the arm of the law, from useless or vindictive persecution.

ITEMS.

The Ladies vs. Tobacco. The tobacco chewers of New Haven appear to be up to their ears in trouble. The ladies of the city assembled not long since, and formed themselves into a society, agreeing to hold no communion with any gentleman who indulged in the use of tobacco.

A Goose Team. A London paper relates an account of a wager won by a son of a nobleman, 14 year old, who navigated the Thames from Blackfriars to Westminster in a washing tub, drawn by six geese in harness. Whenever the geese deviated from the true course, he put them right with his stick. He won 50 guineas by his performance.

Hogreeves. By a late law, this ancient and honorable office has been abolished, and the duties transferred to the field-driver. The newly married man can no longer be chosen hog-reeve.

EFFECTS OF OPIUM IN CHINA.

OUR Indian subjects will be more likely to succeed in conquering China by the demoralizing effect of opium than we should by force of arms. The horrible scenes described by M. Guizot are most appalling. Mr. Majoribanks says the palace of the Viceroy of Canton was burned down by the opium pipe of his secretary; that the Emperor's eldest son died from excessive indulgence in the use of it; and that all persons of wealth are addicted to it. To such a pitch has the smuggling trade arrived, that one of the Viceroys recommended it should be legalized. It is said that the amount paid for this deleterious drug is nearly four millions sterling a year, mostly from Bengal. If once legalized, the poppy, like tobacco, will be universally cultivated, all ranks will become enervated and reckless, and the western mountaineers, recently and perhaps still in a state of rebellion, will once more conquer and overcome China.—*English Quar. Review.*

For Sale at the Agricultural Warehouse,

—HARDEN'S improved SEED SOWING MACHINE. This is one of the best labor saving machines in use, calculated for sowing small seed. The saving of seed in the use of this implement is more than sufficient to pay the cost of it annually. Price \$5. ap 16

Howard's Improved Patent Cast Iron Plough.

FOR SALE at the Agricultural Warehouse 51 & 52 North Market street, a further supply of Howard's Improved Patent Cast Iron Ploughs. The very extensive sale these ploughs met with the past season, and the very general satisfaction they gave to all persons who used them, give them decidedly the preference over all ploughs now in use—a constant supply of them will now be kept for the accommodation of the public, and all orders will be supplied on the same terms as at the manufactory. a 16

For Sale at the Agricultural Warehouse,

—WILLIS' Improved Cast Steel MANURE FORK, the best warranted article that has been made for the purpose. a 16

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,
1 Case wet (but not damaged) Bishops Lawn.
1 do. do. do. Book Muslin.
Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation. m 14

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table mats. istf. a 16.

COMMUNICATIONS.

For the New-England Farmer.

RECRUITING GRASS LAND, &c.

MR. FESSENDEN—Sir, For a few years past, I have been trying, with some variation, the method of Elias Phinney, Esq. of laying down land to grass, by sowing upon the inverted sward, as recommended in his communication, published in the N. E. Farmer, vol. viii, page 42—an article which is worthy a yearly republication until Farmers shall more generally avail themselves of the benefit that may be derived from it.

My first experiment was commenced in 1830, on about one acre of ground, a sandy alluvion, rather heavy, which had been in grass for perhaps fifty years, and had formerly given two crops yearly, by means of frequent top-dressings of manure.

After having been neglected for some years, in 1829 it came into my possession and gave one crop of about three-fourths of a ton of pretty good stock hay. The ground was not suitable for English grain on account of the neighborhood of barberry bushes and perhaps other causes of blight, and I wished to keep it in mowing with as little interruption as would consist with profitable management. In order to do this, the question to settle was, whether a top-dressing of manure should be applied sufficient to wake up the old sward; or the usual rotation, including not less than two hoed crops and two dressings of manure, should be adopted; or the method proposed by Mr. Phinney. With a little variation I took the latter as being more expeditious than the rotation system, and more economical than the first mentioned.

In May 1830, the sward was well turned over with a furrow of from four to six inches deep, varying with the thickness of the sod and depth of soil. It was then rolled down smooth, a light dressing of manure spread on and harrowed in, and potatoes were planted in hills. Care was taken not to disturb the sod during the process of cultivation.

In September the crop was gathered. A most abundant growth of tops was obtained, and a fair crop of potatoes, injured however by dry weather. After digging the potatoes, the tops and weeds were collected and carted to the pig-yard for manure, and the ground immediately ploughed, with a light plough and one horse, so as not to disturb the sod; after which it was harrowed and sown with herds-grass and clover seed, and again harrowed and rolled. The grass seed was sown without any grain, came up well and grew finely until winter.

In the spring of 1831, I found the clover much killed, owing probably to its being sown so late. The herds-grass and what clover remained came on well and gave two crops, estimated at about one ton each, of very good hay. From the grass being so young the quality of the first crop was very similar to that of the second crop or rowen. In 1832 the first crop made hay of the first quality, and was estimated by a man of good judgment, who assisted in cutting it, to be three tons. The second cutting gave about three fourths of a ton. In 1833 it was cut but once; the crop was not as

heavy as the first crop of 1832, but was very good. A large part of it was lodged, for some weeks before cutting. Estimated at from two to two and a half tons.

I think these results go far to prove the value of Mr. Phinney's method. With one ploughing and a light dressing of manure, I have had a fair crop of potatoes, and grass, making by estimation about eight tons of hay, from one acre of ground, in four years. This is undoubtedly a greater nett profit than was derived from the same ground, in any preceding ten years, and the land is now in better condition than it was in 1829, and the old sward which is quietly decomposing beneath the surface, will probably without further expense continue to send up good crops for some years. When turned up it will of itself form a mould sufficiently rich to give a good crop of corn or potatoes with little manure, and insure grass seed to take well again.

It will be perceived that the weight of the hay was estimated. As it was for "home consumption," I thought it not worth the while to be at the expense of driving it half a mile and weighing in order to ascertain the exact quantity, but considered an approximation to the truth in that respect sufficient for the purpose in view. If we did not very much over-estimate the quantity, I think it evidently a more economical application of labor and manure than the usual one of frequent ploughing, and as frequent exposure of the vegetable matter in the soil to the drying and dissipating influences of the sun and wind. I believe the effect of frequent ploughing is not as well observed by our farmers as it should be. So far as my observation goes, it is injurious; and I have but little doubt that our best soils might be exhausted and reduced to perfect barrenness, without a single cropping—only by frequent ploughing for several successive years. I could mention a case or two that would go far to prove this, were it necessary.

My next experiment was commenced in 1832 on a piece of about eight acres, in the same field with the other. The soil was rather lighter and more sandy, and had formerly been somewhat reduced by excessive working, but latterly had recruited by neglect. In 1831 it gave a crop of about half a ton of hay per acre, worth little more than the expense of getting.

In May 1832 it was nicely turned over with a furrow three or four inches deep; intending in no case to go below the top soil. After being rolled, about twenty or twenty-five cart-buck loads of compost manure (made by mixing one load of manure with two loads of meadow muck on good soil, and piling up in layers over winter,) were spread on each acre and harrowed in. It was then planted with corn, and cultivated with the harrow and hoe. No plough was used among it, and no hills were made. Before it was harrowed for the third hoeing, four quarts each of herds-grass and southern or June clover seed, and eight quarts of red-top seed were mingled and sown to an acre. Care was taken through the whole course not to displace the sods, and to keep the ground even, and at the last hoeing to prevent the grass seed being unequally scattered. My object in this experiment was to get in the clover early enough to have it stand the winter, and also to have the

first cutting of hay a little more substantial than I had found it in the last experiment. The seed was sown just as the corn began to tassel out, and when the young plants made their appearance, which was in a few days, the corn had become a suitable and sufficient protection from the scorching heat of the sun. The shade soon became so close and thick in most parts of the field that the grass grew very slender and seemed to make little progress until about the first of September, when the corn blades began to curl and admit by degrees sun and air; after which it grew finely, and by the time the corn was harvested, had covered the ground almost entirely.

The corn was planted about three feet distant each way, and in some places grew so stout and thick that the pumpkin vines, of which there were a few, left running on the ground and went from hill to hill in the corn, yet the clover was not smothered, as is frequently the case among oats or other small grain that grows large enough to lodge.

In the spring of 1833, after the ground had become dry, it was rolled for the purpose of crushing the corn stubs and levelling for the scythe. The clover came out finely and with the herds-grass and red top made a large growth, of each nearly equal quantities. The first crop gave twenty two loads, estimated at three fourths of a ton each, or two tons to the acre, entirely free from old stubble and weeds, and worth at least twenty-five per cent more than hay of the first year's cutting usually is. I was offered for it the highest price at which the best hay was selling in the market. The second cutting or rowen, gave an average as estimated, of one ton to the acre.

I sold a few tons of the first crop at thirteen dollars, and of the second at ten dollars per ton. If our estimate of the quantity was correct, this would give thirty-six dollars per acre as the proceeds of one year's crop. The highest price at which the land has ever been sold is, I believe, thirty dollars per acre, and before I commenced these experiments it was reputed so poor that I could find no one willing to cultivate it on shares, with the privilege of managing it his own way.

This crop was made to supersede the oat crop, with which grass seed is usually sown, and the advantages of it must be evident to any farmer without much argument. It is perhaps sufficient to say that an oat crop in addition to its exhausting the land, (which in the opinion of many farmers is no trifle) would cost quite as much as the grass crops, and setting aside its liability to blight, would not be worth half as much.

There were sundry knolls, head-lands and patches on the piece, which had seldom or never been ploughed, but had been left to run up to weeds and brush. These places had been the resort and abode of squirrels and woodchucks in numbers sufficient to contend successfully with the former occupant for at least one half of the corn, beans, and clover that grew neat them. When the rest of the piece was ploughed, these by the aid of a strong knife or coulter were ploughed also, and gave excellent crops of both corn and grass without any different management than was bestowed on the rest of the field, roots and stubs to the contrary notwithstanding.

It is a mistaken notion, I believe which is generally held, that land in a condition similar to these spots must be ploughed and cross ploughed and dragged and hoed, year after year, for several years until its strength is in fact exhausted, before it is sufficiently subdued to become productive. As well may the farmer, by hardship and abuse, break his young horse and call it *subduing*! In either case I apprehend the most effectual method is taken to defeat the object in view, which is future benefit; and one might almost as soon think of deriving profit from the labors of a broken winded, broken down horse, as from the cultivation of a field that has been through the usual exhausting process of subduing, except where manure is applied at the same time.

I regret the necessity I am under of resorting to estimates when stating an experiment; it is too indefinite, but perhaps will do better in a grass crop than most others; for all farmers know without *guessing*, that grass of the above mixture does not lodge or fall down for weeks before cutting, as was the case with a considerable part of both crops, unless it be stout.

The last experiment was first suggested to my mind and I was led to try it with a good degree of confidence, by observing a few fine large plants of clover in the fall of the previous year, in my corn field, a sward that had not been ploughed before for twenty years, where a little clover chaff had accidentally been scattered about the time the corn was planted. It was from the fine appearance of these plants among corn that had received the usual harrowing and hoeing, that I was induced to extend the experiment to another piece of four acres, which was a light sandy soil, but gave a result equally satisfactory and favorable.

The test of another fall and winter on a like quantity of ground, of different soils, sown the same way as that of 1832, tends to confirm me in the opinion, that grass seed sown among corn "catches in" better, stands the winter as well, and is much less likely to be destroyed by mice than that sown in the usual way among English grain.

Grass is, and probably ever will be, one of the most valuable products of our New England soil. A crop on which, as much and perhaps more than any other, we are to depend for our wealth. Without it, our valleys would become comparatively poor, and our hills of little or no value. Improvement in its production is desirable and undoubtedly attainable. To make "two blades of grass grow where but one grew before," may appear to others a small business, but 'tis truly an object worthy of the attention of every farmer.

Yours respectfully, WILLIAM CLARK, JR.
Northampton, April 1834.

For the New England Farmer.

CAPITAL REQUISITE IN FARMING.

MR. EDITOR, Among the many causes assigned for ill success in agricultural pursuits, of which farmers are often reminded, there is one but rarely adverted to, and I suspect by many farmers has never been considered at all. And that is the absolute necessity of a loose capital to enable a farmer to cultivate his farm to any advantage. The amount of this capital should be nearly equal to the entire annual product of his farm, after deducting his annual gain, if there be any.

Suppose the entire annual product of a farm to be \$1000

Deduct supposed annual profit, - \$150
Deduct also such portion of the milk, butter, grain, potatoes and sauce generally, as is used in the family during the same season of their production, 80—230

Leaving to be expended in living and working farm before receiving returns of produce of farm, - \$770

Now if the farmer himself is both able and willing to perform the labor of one good hired hand, it will be equal to about 200 dollars of this sum, leaving 570 dollars the least amount of loose capital that will suffice to carry him through the year, without being pinched or obliged to slight his work. The amount of wool, flax and provisions, reserved for the consumption of the family from year to year, is included in this sum.

As this is a subject of importance, and as I wish to be clearly understood, I will proceed a little further. Farmers who live so far from market as to find it impossible, or inconvenient to get the produce of their farms to market before winter (and these constitute a very large majority), it will be seen at once, must incur the entire expense of working their farms and providing for their families for the year, before they realize any thing worth naming from the produce of their farms. Their hired hands must be paid in autumn, if not sooner, and if they expect to get store goods and mechanics' work at a reasonable rate, they must pay as they go along. A farmer sells his pork, butter, cheese, grain, &c. from January to April. The cost of producing all these, was paid, (or ought to have been,) the summer and autumn before. His sheep are sheared in May, and should he be able to convert their fleeces immediately into money, (which he cannot always do,) still the whole expense of producing this wool, excepting about two months spring pasturing, was paid the year before, a considerable portion of it the August before.

It cannot be denied that a farmer can get along after a fashion, with little or no capital, because it is done by thousands every year. Some may inquire how this can be possible if the foregoing statement be correct. A farmer without capital, in the first place, will not perhaps hire more than half as much labor as his farm requires; of course all his work is slighted, and all done out of season, and half crops is the consequence. When the time arrives for paying his laborers, perhaps he will get some things out of the store for them on trust, or borrow a little money to pay them in part, and put off paying the remainder until winter or spring, to the no small injury of his credit, otherwise he must force the sale of some of his scanty produce at a reduced price, to make out the pay. In the next place he buys of the store-keeper wholly on a long credit, and pays a price accordingly, say twenty to thirty per cent. more than the cash price. His dealings with the blacksmith, shoemaker, and mechanics in general, are after the same fashion. And thus he passes his life continually pinched for the want of a little money, incessantly harassed by duns, and once in a while is appalled by a tap upon the shoulder, though gentle it may be, of the practised hand of a constable. And for this he must pay the latter and his co-worker the lawyer, a sum of money for which he has never received any equivalent. And thus he brings the year about—no, properly speaking, he never brings the year about. He is forever toiling to bring up the arrears of the last year. Time has got the start

of him by one year, and he in vain attempts to overtake it.

It is a common remark that small farms are more profitable than large ones; this in the abstract is not true. Though it is doubtless true that multitudes of farmers greatly injure themselves by enlarging their farms *without an adequate increase of capital*. How often do we see farmers who have in the course of years accumulated a little money from small farms, barely enough to enable them to cultivate their present farms to the best advantage, invest the whole of this very capital in more land. Thus making an increase of capital necessary by the very act which deprives them of the little they already possessed. Could farmers who are without a loose capital be persuaded to pursue a precisely contrary course to this, to wit, sell off so much of the land they already possess as will raise a sufficient loose capital to enable them to cultivate the remainder in a proper manner, it would increase both their profits and comfort.

If any thing will excuse a farmer for mortgaging his farm, it is the hiring of money to work that farm. Though he ought in this case to be very certain that he is possessed of so much resolution and discretion, as to be in no danger of ever appropriating money so raised to any other use; so long as it is applied to this use only it is not so very hazardous a plan. Before a mortgage can press heavily upon his farm, the money can be repaid, and at the worst he has only to return to his former method of farming by the halves and without either satisfaction or profit. I do not wish to be understood as recommending to farmers the practice of raising money on mortgage. It is better with rare exceptions, where money must be raised, to sell off a portion of the farm, and preserve the remainder free from incumbrance.

H. W.

From the *Amaranth*.

A FRAGMENT.

Who that has passed a summer in New England cannot in the beautiful language of Montgomery say, 'That a thunder storm is the eloquence of heaven.' While listening to the distant, muttering thunder, who has not felt the soul inspired?—Has not felt as though the music of the spheres struck his ear? It might have been termed music, as well as the 'eloquence' of heaven. Yes, there is music in the far off rumbling thunder, which far excels that of mortals. But as it approaches nearer and nearer, and grows louder and louder, when lightnings flash, and hail and rain tempestuous fall, then how different the feelings they may cherish! Instead of being charmed at its music, fear takes possession of their hearts when they behold—

"Struggling nature gasp for breath,
In the agony of death!"

Recollection is busy in calling to mind the soil they have seen ploughed up by the lightning's blast, the scathed trees of the forest, and steeples levelled to the dust. What a contrast! A moment since, their souls were enraptured at the sound; now every appeal adds increased terror. The rosy cheek of maiden beauty is turned to ashy paleness; the man of daring hardihood acts the part of a child; while the little prattler, burying his head in his mother's lap, now and anon lisps, "Mother, will it hurt me?"

"Now louder, deeper, thunders crash
And desolation threatens all."

The oak which has withstood the winds and blasts of many years is torn from its bed, and its towering branches prostrated. "Startled nature reels!" From solid darkness leaps the vivid flash, and dreadful rolls the echo through the sky!

No wonder man should fear, when the fierce elements thus rush forth at war! The rude laugh ceases; the laborers are still; the birds are mute in their leafy bowers; Jehovah speaks! Let man be silent! But lo, again fear subsides, gladness awakes, the sky is hushed and the bow of sunshine smiles and cheers each trembling soul.

INTERESTING PHILOSOPHICAL FACTS.

THE change of property which takes place when chemical attraction acts, is not confined to metals, but is a general result in every case when different bodies are brought into this state of combination or chemical union. Frequently we find, that the properties of each body are totally changed; and substances from being energetic and violent in their nature, become inert, harmless, and *vice versa*. For instance, that useful and agreeable substance, culinary salt, which is not only harmless but wholesome, and absolutely necessary for the well being of man, is composed of two formidable ingredients, either of which taken into the stomach, proves fatal to life; one of these is a metal, and the other an air; the former is called *sodium*, and the latter *chlorine*. When presented to each other, the violence of their nature is manifested by their immediate bursting out into flame, and instantly they are both deprived of their virulence. Can any thing be more striking than the change of properties in this case; and who could have supposed that the culinary salt is composed of a metal united to an air.

The medicine called Glauber's salts is another instance; it is composed of caustic poisons of different kinds; one called oil of vitriol and the other barilla or soda. There are also two substances known to chemists which are disgustingly bitter liquids; one is called nitrate of silver, and the other hydrosulphate of soda; when mixed they are found a compound of considerable sweetness. But the atmosphere which we breathe is the most extraordinary of all instances, to those who are acquainted with the fact, that atmospheric air indispensable as it is to life, is composed of the same ingredients as that most violent and destructive liquid called *aqua fortis*, or nitric acid. This powerful acid by being made to act upon sugar, the sweetest of all things, produces a substance intensely bitter to the taste. Charcoal is, of all known substances, the most difficult to convert into vapor, so much so indeed, that the conversion has never been yet decidedly effected, it is also a very solid substance; and a diamond which is nothing but chrystalized charcoal, is one of the hardest bodies in nature. Sulphur, in the solid state, is also a hard substance, and to hold it in vapor requires a high temperature. But when these two substances, carbon and sulphur, are made to combine chemically, so as to form the substance called bisulphuret of carbon, their properties are strikingly changed. Instead of the compound being hard, it is a thin liquid, and is not known to freeze or solidify at any degree of cold that can be produced. Instead of the compound being difficult to evaporize, it is of all liquids one of the most evaporable. Charcoal is the blackest substance with which we are acquainted, sulphur is of the

most lively yellow hue; but the compound is as colorless as water. A new smell and taste are acquired, and in a word there is not one point of resemblance with the component. These facts are strikingly illustrative of the change of properties which follows on the exertion of chemical attraction between the ultimate particles of bodies.—*Donagon's Chemistry*.

From the New York Farmer.

SUGGESTIONS RELATIVE TO FARMERS' WORK FOR APRIL.

Ploughing. Various opinions are given in respect to the depth of ploughing. As a general rule we believe the most successful farmers plough no deeper than the soil or rather the turf extends. This soil is not generally more than two to four inches; consequently if the plough runs five or six inches deep, the soil or fertilizing portion of the furrow must become so very much diffused that the plants particularly when young will not find sufficient nourishment. This being the case, it would seem that the direction so generally given to plough a sandy loam deep, should also depend on the depth of the manured portion of the soil. The best farmers of the present day direct the utmost pains to be taken to turn the sod so completely that it will all ferment. This is done most effectually by one ploughing only, and some to keep the sod from being in the least turned up by hoeing and ploughing the corn, pass a roller over and then harrow the field before planting.

Oxen. It is very common, with even good farmers, to keep their working oxen in very thin flesh. This is bad policy; they cannot perform as much nor as heavy work; are not so capable of being substitutes for horses, nor will they last as many years; are fattened for the butcher at greater expense, and in longer time. The extra expense in keeping working oxen in good condition does not probably exceed in a whole season the additional work they could thereby do in one month. And when we consider that they consume less food in fattening, and can be moderately worked all the time they are preparing for the butcher, it will be seen that there is economy in keeping a good portion of flesh always on them. Many people are under the impression that oxen in flesh cannot move as fast, nor undergo as much fatigue, as they can when they are not much more than skin and bones. This is true with oxen that are well fed and unaccustomed to labor; but not otherwise as many farmers can testify, and as correct reasoning would conclude.

Corn. In communications from farmers we find that some varieties of corn will yield five pecks of shelled, from two bushels of ears, and others but little, if any, more than four pecks. This seems to depend very much on the smallness of the cob. In planting corn, it is recommended to put six to eight kernels in a hill, and then to pull up at the first hoeing all but four of the most healthy spears.

To prevent birds and fowls from scratching up the corn, the seed is covered with tar and wood ashes; and various other methods are adopted, but none that we are acquainted with have any decided advantages.

Skinless Oats. This kind of oats begins to be considerably cultivated. As yet the seed commands a pretty high price, yet it is advisable, for every farmer who can, to procure at least a few quarts.

Flesh-colored Clover. It would be well for farm-

ers to furnish themselves with a few pounds or even ounces of this seed in order to test its merits. It may be of great benefit.

TEMPERANCE.

No man ever began to drink, for the purpose of becoming a drunkard; no man ever meant to be a drunkard. How is it then that so many are drunkards? Ardent spirit was to them what a bait in the snare is to an unwary bird. They knew not the danger they were in, when they began to be cautious drinkers. Cautious drinking is an endeavor to pull the bait out of the trap without getting caught. Let it alone. No man is safe who drinks cautiously. If you get into the habit at all, it is like the rash or ignorant mariner entering the disk of the Maelstrom, that great whirlpool on the coast of Norway. He cannot keep upon the edge. Each circumstance carries him nearer to the centre, and of course to irretrievable destruction. His only safety lies in keeping out of the current, and at a distance from it.—Some people drink to drown sorrow. Unwise! they drown themselves. They are about as reasonable as the mad commander of a vessel, who, because he had troubles on his voyage, ran his vessel into the whirlpool, that the dizziness produced by the rapidity with which he made the circumference, might cause him to forget his troubles.—*Trumpet*.

A NEW METAL.

In the month of August last, Professor Briethaupt, in Freiburg, determined a new substance, possessing very remarkable properties—solid or native iridium. Platinum has long been considered the heaviest of all metals; but Professor B. shows that native iridium is two parts heavier, viz. 23 3 to 23 6; platina being only 21 5. In the 17th and 18th Nos. of the "Annals of Chemistry and Physics," there is an article, from which we extract the following particulars relative to this discovery. Professor Briethaupt found the substance which he has determined in grains from the gold and platina works of Nischno-Tagilsk, on the Oural, which were brought to him by some young Russians who are studying at Freiburg. This substance has a shiney and perfectly metallic lustre. Externally the color is silver-white, strongly inclining to yellow; internally it is silver-bluish, inclining to platina grey—"its hardness," says Mr. B. "is from eight to nine of my scales, and therefore it immediately polishes the best files. This substance is consequently the hardest, in all probability, of all metals and metallic compounds." This metal is therefore a new species. According to the examination hitherto made by Professor B. it consists of iridium with a very little osmium. It combines with their hardness and specific gravity, in which it exceeds all metals hitherto known, two other remarkable properties. It actively resists the action of acids, and is in a high, perhaps the highest degree infusible.—*Lit. Gazette*.

AWAKENING SUDDENLY.

To awaken children from their sleep with a loud noise or in an impetuous manner, is extremely injudicious and hurtful; nor is it proper to carry them from a dark room immediately into a glaring light, against a dazzling wall; for the sudden impression of light debilitates the organs of vision, and lays the foundation of weak eyes from early infancy.

From the *Genesee Farmer*.

PUMPKINS.

I AM not much of a farmer, my own time having been occupied for many years in other business, so that I have not had those opportunities for making experiments in agriculture that are calculated to advance the interests of said science. It was nevertheless my good fortune some eight or ten years ago, to procure some seeds of the pumpkin, the culture of which has proved so peculiarly advantageous, that I am anxious to call the attention of farmers to the subject. No doubt these remarks may excite a sneer from many of your sagacious readers, who will lay by the paper in contempt, and say "who does not know all about a pumpkin?" The man from whom I procured the seed possessed rather a facetious turn, so that in his recommendation of his pumpkin seed I at first apprehended that he was indulging in that merry propensity, as he remarked that they would grow in so long a shape that a man might carry one on his shoulders with the same facility that he could a stick of wood or a rail. When my pumpkins came to maturity, I found there was too much truth in his remark to be all a joke. They will sometimes grow to the length of from 20 to 30 inches, and perhaps a foot in diameter. Their peculiar advantage over the common round pumpkin, consists not in their shape. The substance of them is thicker, of a finer texture, and very evidently sweeter than the other kind. The space containing the seeds is small in proportion to the size of the fruit, and consequently they are proportionably heavier. Some of them have weighed over sixty pounds. I have not failed a single year of raising a luxuriant crop; and a neighboring farmer who procured some of the seed from me and used it two seasons assured me that it has proved a nett gain of more than \$20. It is a true maxim, that "what is worth doing at all, is worth doing well." So, although the subject of my communication is a pumpkin, if it is worth raising it is certainly best, if there be any choice in the seed, to select the best and cultivate it in the best manner. In cultivating the pumpkin, I have usually followed the example that has been set me by neighboring farmers, and planted the seed along with that of my corn. Two years ago a circumstance occurred that has caused me to doubt if that is the most economical method. A pumpkin plant came up by accident near the door of my dwelling, and was discovered by a little boy, and mistaken by him for a plant of a watermelon, and by him transplanted among the tender vines in the garden. It so happened that the bugs or some other blight destroyed the other vines near it, so it had ample room to develop itself in all directions; the consequence of which was, a crop from this one plant that weighed 215 pounds. Now it must so be, that the luxuriant crop of vines that is produced among the hills of corn, must diminish in some degree the crop of corn. So the question would arise whether it would not be the most consistent and profitable mode to plant them in fields separate from other crops? Perhaps some of your numerous readers have tried the experiment.

C. B.

Phelps, April 18th, 1834.

INSECTS.

THOSE who are desirous of keeping their fruit trees free from insects, should wash them with soap suds before the insects have passed the win-

ter, and before the eggs which were deposited under the loose bark, and beneath limbs, &c. have hatched. By early washing trees, and vines, with strong soap suds, or with lime water, not only are innumerable eggs and insects destroyed, but the young plants and seeds of many varieties of mosses which infest or injure trees and vines are destroyed also. Trees that are annually washed, have a more healthy appearance than those that are not, when growing side by side.—*Bangor Courier*.

SILK.

—WE are impressed with the belief will, at some remote day become the staple commodity of Northampton. We are glad to see some efficient individuals in this town setting an example worthy of imitation. Immense quantities of Mulberry trees have been transplanted this spring, and experiments with the silk worm are now to be tried on a large scale. Those individuals who have entered into it extensively have found it immeasurably the most lucrative employment they could follow. It yields a certain gain, and gives occupation to the young of both sexes, four fold more profitable than the mere pittance they get from their employments at the present time. It is worthy the attention of all our farmers and at least will repay them the trouble of an investigation. The fluctuation of the principles of government or change of rulers will not enhance or diminish its value; and it might save the population of New England from emigration and death, with fever and ague in the western country. Will not our people, who now complain of hard times, awake to new sources of industry, and do something which can be done to increase their pecuniary gains.—*Northampton Courier*.

From the *Genesee Farmer*.

ASPARAGUS.

ASPARAGUS "in its native state is so dwarfish in appearance even when in flower, that none but a botanist would consider it as the same species with our cultivated plant." From this we may discover the great benefits of high culture. Some gardeners recommend the beds to be dug one foot deep; but the Edinburgh Encyclopædist, from whom we have made the above extract, says "the soil should not be less than two feet and a half deep." he adds, "it can scarcely be too well dunged."

The soil, (or subsoil) should undoubtedly be loose; and the Encyclopædist recommends a rich sandy loam. The finest Asparagus that we have ever seen however, grew in gravelly ground cultivated by the late Comfort Tyler at Montezuma. It is highly probable that the soil is impregnated with salt. The use of this mineral as a manure for this plant is well known to many gardeners; and we are satisfied of its value from our own experience. We think neither cows nor sheep require this stimulant more than Asparagus. Deane says "To a bed fifty feet by six, a bushel of salt may be safely applied before the plants start in the spring." We often apply it long after they have started.

The same Encyclopædist says "Damp ground or wet subsoil is not fit for Asparagus. Indeed the French consider wetness so prejudicial to this plant, they raise their Asparagus beds about one foot above the alleys in order to throw off the rain.

Gray, an English botanist, says, "The plants are mostly dioecious;" and Weston in "the Repository of Arts," observes that the males yield a greater number of shoots than the females. He

advises in planting out beds to select the former and to prevent mistakes says they should not be taken from the seed bed till they have flowered.

Asparagus "is found on the sea shores in many parts of Europe; and is abundant in the inland sandy plains in Russia, Turkey and Greece. It was in much esteem both among the Greeks and Romans. It was much praised by Cato and Columella; and Pliny mentions a sort which grew near Ravenna, a deep sandy country, three shoots of which would weigh a pound." Loudon's Encyc. Plants.

Many gardens in the Genesee country have been laid out on heavy loam; and for Asparagus beds we would advise the proprietors to prepare an artificial soil. We have lately seen a bed for this purpose which is two feet and a half deep.

From the *Genesee Farmer*.

FUEL.

As many farmers are in the practice of using unseasoned wood for fuel, perhaps an estimate of the actual loss sustained by it, may serve to show the importance of an attention to this subject.

It appears from direct experiment made for the purpose, that several of the harder and more common kinds of wood, when subjected in a green state to a temperature of 90 or 100 degrees Fahrenheit, lose rather more than one-third of their original weight by the evaporation of moisture; but when dried at a low temperature it amounts to a little less; so that the average may be fairly estimated at one-third of the whole weight. It has also been determined that the weight of such wood when green, if compared with that of water, is on an average about as nine is to ten. Admitting that the interstices in a cord are equal to two-fifths of its whole bulk, it follows that there are seventy seven solid feet of wood, equal in weight to sixty-nine cubic feet of water; and as one cubic foot of water weighs sixty-two and a half pounds, the weight of a cord will amount to four thousand three hundred and thirty-one pounds. A cord must consequently contain one thousand four hundred and forty three pounds of water, or one hundred and seventy four gallons nearly. This includes only such as is capable of evaporation at the mean temperature of the atmosphere. Now it is a well established fact, that the heat requisite for the evaporation of a given quantity of water, is four and a half times the amount required for heating the same quantity from the freezing to the boiling point. The heat therefore requisite for expelling this moisture, even after it has become heated to boiling is equal to what would be required for heating six thousand four hundred and ninety-three pounds, or nearly twelve and a half hogsheads from freezing to boiling; and as it passes off in a latent state, the whole of it is totally lost.

It will also be perceived that the difference between green and dried wood amounts to the weight of one cord in three. This estimate will therefore suggest when it becomes necessary to convey wood to a distance, the advantages of causing it to be previously well dried.

When wood becomes partially decayed, its capacity for moisture is increased, at the same time that its power of generating heat is diminished; and the consequent loss of using such as fuel, unless thoroughly dried, is increased to a far greater amount.

J. J. THOMAS.

Cayuga county, 2 mo. 1833.

MANURE.

On the relative advantages of applying manure to the soil in a fermented or unfermented state, a contrariety of opinions continues to exist among farmers. The following extract from the "Reports of Select Farms," contains much good sense, and will pay for a careful perusal. It forms part of the report from Kyle in Ayrshire:

"*Manure.*—Of this the only source here is the farm-yard, and considering its value and how much its value depends on its treatment, it does not yet receive all the attention it deserves. On a farm of this extent, on which there has never been in one year above three acres of turnips and four of potatoes, it is perhaps a good deal to have manured eighteen acres in a season, from the farm-yard and the servants' cottages, and yet there is no doubt a great deal more might have been accomplished, as respects both quantity and quality. If exposed to rain, the most soluble and richest parts are carried off. Observe the luxuriant vegetation wherever the dark liquor from the dunghill touches, and the loss may be estimated. If allowed to come into a strong heat, its substance may be seen passing into the air. The only part of it that requires rotting and fermentation to render it soluble and fit to become food for the roots of plants, is the woody fibre vegetables; the closer, however, and more confined the manner in which this process goes on, there will be the less loss. Some practical farmers have advocated the use of dung in its more recent state; others have said it should not be used till well rotted. But if in the process of rotting it probably undergoes waste, the place in which it must with most advantage be rotted, is under the soil of the field. There is then no loss that can be avoided. The fallacy in this controversy arises, it is suspected, from not adverting to the circumstance that equal hulks of recent and of rotted dung contain very different quantities of the food of plants. In the latter it is more concentrated, and in a state fitter to be immediately consumed by their roots. But the correct way of stating the question is this: having a given quantity of recent dung to apply to a given extent of land, is it not better to plough it down in its recent state, than previously to allow it to ferment and rot in heaps? In the first case there is no loss: the decomposition goes on as slowly as possible, and all the elements of the substances of which it is composed are retained in the soil as they are set free. In the second, the decomposition is rapid, and a much larger proportion of matter will be found to have flown off than could easily have been imagined. Any person, without the aid of knowledge of chemical principles, may satisfy himself on the point by an easy experiment. Take two acres of ground of equal quality; take twenty tons of recent dung, which apply to one of them; take twenty tons of the same dung and put it up in heaps till it becomes a black solid mass, and then apply it to the other acre; balance the produce of the one against the produce of the other, at the end of the fourth year, and if the experiment be well conducted the result ought to be satisfactory. A knowledge of chemical principles leads to the inference that dung ought to be used in its recent state, and any disappointment which in practice may have attended the adoption of this inference will be found to have arisen not from a defect in the theory but from a want of due observation of circumstances in its application. If immediate effect be absolutely requisite, as in raising turnips, then rotted

dung must be used, but care should be taken in preparing it to prevent its heat from rising high or any of it from escaping, either in a liquid or in a gaseous state. This is best accomplished by compression and by covering well up with earth."

SOWING GRASS SEED.

This is a very important operation, with farmers, during the Spring months. Much difference of opinion prevails, with regard to this, as to time, quantity of seed and manner of sowing it.

As to the time for sowing most farmers prefer sowing grass seed, when the ground is covered with snow, during the month of March. The only advantage to be derived from the circumstance of the ground being covered with snow, is, that the person sowing the seed, can see his own tracks, by which he is saved the trouble of setting stakes. The quantity of seed per acre can only be regulated by circumstances, as it is generally allowed that light poor soils require more than strong rich soils. Most farmers sow their seed without mixing it with fine dry sand. We have lately read the description of a machine for sowing grass seed which we presume was a yankee invention. This machine consisted of a small pair of wheels and axle, six or eight feet long, more or less. The axle passed through the centre of a cylinder which was punched full of holes at regular distances. The grass seed to be sown was first to be mixed with dry sand and put in that cylinder, and the carriage drawn across the field backward and forward, by which the seed would be equally distributed over the whole surface. But in whatever manner grass seed is sown it is important that the ground should be rolled after it is sown, which will render the surface more compact, and prevent young plants from becoming dried by the sun and air; it also prepares the surface for any after operation. When the surface is smooth more hay can be cut, than where it is rough, and every farmer knows that an even surface is better for ploughing than a rough one.—*Goodsell's Farmer.*

From *Goodsell's Genesee Farmer.*

CLOVER AND WHEAT.

Among all the modern improvements in Agriculture, none are of greater importance, than the substitution of a rotation of crops, in place of manure. By a proper attention to this, land may not only be prevented from becoming poor, but may be increased in fertility. For this purpose there has not as yet, been any crop discovered so generally approved of in this section as clover, or at least none that is so well calculated to improve our lands and prepare them for the leading crop, wheat, which under proper management will in all probability continue to be the staple article of western New York.

Barn yard manure has always been considered valuable by every well informed agriculturist, and there are many crops to which it can be applied to advantage. The crops to which manure from the yard or compost heap, are applied to best advantage are of small consideration when compared to our crops of wheat. Manure might also be applied to those lands intended for wheat, but where farmers sow from fifty to two hundred acres, the small quantity collected in yards and compost heaps, would do but little towards preparing or keeping farms from becoming impoverished. Even allowing that a sufficient quantity of barn yard manure could be collected by every far-

mer for his wheat fields, it could not be applied at the same expense, with which fields are now renovated by means of clover, and a proper rotation of crops.

That a rotation of crops is absolutely necessary upon most lands, every experienced farmer will readily admit. It is a well established principle, that each plant requires a particular kind of food, and by continuing the same plant upon grounds for many years that particular food becomes exhausted, but by introducing a crop which requires a different kind of food, the former, or that exhausted by other crops is allowed to accumulate, the crops requiring the same food may in some instances be allowed to succeed each other, by introducing the one less valuable and allowing that to decompose upon the soil to furnish food to the more valuable one. This is the case when clover is used to prepare the ground for wheat.

By analysis it is found that both clover and wheat contain a small quantity of lime, and of course soils which do not contain this naturally, must be supplied with it artificially, before these crops may be grown to advantage. Lime requires also to be in different conditions, in order to be taken up by different plants. Experience has demonstrated that when the sulphate of lime, or plaster of Paris is applied to soils, that it increases the growth of clover, and that when clover grown upon the soil is mixed, either by ploughing in the whole crop, or by turning under clover stubble; that it prepares such soils for producing wheat in greater perfection than when manure is applied from the yard.

It has been by pursuing this course of tillage, or rotation of crops, that many lands in western New York, which by nature were thin, light soils, and which did not when first cultivated produce more than fifteen bushels of wheat per acre, have been made to produce from thirty to forty bushels.—How long the fertility of lands thus managed will continue to increase is unknown, but thus far our fields which have been cultivated the greatest length of time, where attention has been paid to rotation produce not only the greatest quantity but the best quality of wheat.

Where fields are clear from stumps and stones so that they can be ploughed deep and regular, and where proper attention has been paid to seeding with Timothy and Clover, many prefer turning clover either in crop or stubble under, and allowing it to remain, working the soil lightly with drags and rollers. In this way it is thought the greatest advantage by the preparatory crop is realized.

ANGLO-ITALIAN FIG TREE.

Among the time-worn ruins of the ancient castle of Reculver, in the island of Thanet, which forms part of the county of Kent, an ancient fig-tree stretches forth its venerable arms to the breeze, and attracts the attention of the visiter, not more by the venerable aspect it presents, than the historical records with which it is connected. This tree, according to the traditions of the neighborhood, claims Italy for the soil of its nativity, and Roman hands for its first planters; its age consequently cannot be less than from 1345 to 1888 years, the Romans having first landed at Deal in the summer of the 55th year before the birth of our Saviour, 1888 years ago; and having finally quitted Britain in the year of our Lord 448, or 1345 years ago.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MAY 7, 1834.

WE have given in this day's paper a valuable communication from WILLIAM CLARK, Jun. on the subjects of ploughing green sward, recruiting grass lands, &c. In this, the writer refers to a communication from ELIAS PHINNEY, Esq. on the same subjects, which he thinks "worthy of a yearly republication," &c. As we entirely coincide in opinion with Mr. Clark, respecting the value of Mr. Phinney's communication to which he alludes, we have concluded to give it at length, instead of our usual variety under the editorial head.

PLOUGHING GREENSWARD.

MR. EDITOR—Your correspondent "*Dorchester*," in No. 1, vol. 8, of the N. E. Farmer, wishes for information on the subject of ploughing and managing sward land. The subject is certainly one of great importance to farmers. Considering the exhausted condition of most of our grounds, and the expense of restoring them by the application of manure, I am surprised that so little attention has been paid to this very essential part of husbandry, even by our most scientific and best practical agriculturists. By the usual method of turning up the sward, and then cross ploughing and harrowing, the sods are pushed about by the plough, and dragged by the harrow, and so exposed to the action of the sun and winds, that the nutritive matter contained in the roots and tops of the grasses is in a great measure wasted. By this practice, the vegetable matter which was before upon the surface, is brought there again, and the poorer part of the soil, which should remain at the top, whereby it would be greatly benefitted and enriched by the fertilizing properties of the atmosphere, is returned to its original position beneath. This is exactly the reverse of what it should be. Let the roots and tops of the grasses, together with all the vegetable matter on and near the surface, be buried and retained to ferment and decompose, and the poor earth be brought to and retained upon the surface, where, by culture and exposure to the atmosphere, it will soon become a body of rich mould.

If the result of my own experience will be of any use to your correspondent, or the public, I give it with pleasure. I ascertained by an accurate experiment, that on the first of May, a single foot of sward land, taken from a field that had been mown for a number of years, the soil a light loam with a gravelly bottom, and thinly set with red top and herds-grass, contained nine ounces of vegetable matter, consisting of the roots and tops of the grasses, giving at this rate over twelve and a quarter tons to the acre. I must confess I was not a little surprised on finding the quantity so much beyond what I had calculated, and it satisfied me of the necessity of adopting some plan by which this valuable treasure might be turned to good account. To make the most of this enormous quantity of vegetable matter, as well for the benefit of the immediate crops as for the eventual improvement of the soil, would seem to be an object worthy the consideration of farmers.

My first trial was upon a piece of worn out pasture land. In the month of August I turned over the sward as evenly as possible, then rolled with a heavy loaded roller. The ground was then harrowed in the same direction as the furrows, with a light horse harrow, and then sowed with buck-

wheat, with red top and herds-grass seed. The bush harrow was then drawn over it, and then rolled again. The harrowing was so light, that the sod was not disturbed. No manure was used. I had a fair crop of buckwheat. The grass seed took well, and looked so promising in the spring following, I concluded to mow it. The crop of hay greatly exceeded my expectations, and, as pasture, it has been less affected by drought, and yielded double the quantity of feed for my cattle that it gave before ploughing.

The success of this experiment induced me to try another. On the first of May, 1828, I had two acres of sward land, which had been considerably exhausted by long cropping, yielding less than a ton of red top and herds-grass to the acre, turned over; having a hand occasionally to follow the plough with a hoe, for the purpose of turning over such parts as the plough had missed. The ploughing was from four to six inches deep, varying according to the depth of the soil, taking care always to go deep enough to bring to the surface a portion of the gravelly and poorer part of the soil. After ploughing, the outside furrow, which was turned out, was taken into the cart, in convenient pieces, and placed in the vacant space which was left in the middle of the lot, whereby this space was just filled, and no ridges left on the outside; the field was then rolled with a heavy roller, and the uneven parts of the sward settled down, and the whole made smooth. It was then harrowed lengthwise the furrows thoroughly with a horse harrow, but so light as not to disturb the sod. Twenty cart loads of compost, made of loam, peat, mud, and stable dung, (a sufficient quantity of the latter having been mixed to cause the whole mass to ferment,) were then spread upon the acre. It was again harrowed as before, and, from the evenness of the surface, the field had more the appearance of having been tilled for a number of years. On the sixth of May corn was planted upon the furrows in drills parallel with them, three feet apart, and the corn six inches distant in the rows, having previously marked out the rows, three at a time, with an instrument made for the purpose, by which the work was performed by one hand in less than an hour. The ploughing between the rows and the hoeing was done without disturbing the sod; and the not only useless, but injurious practice of ridging, or hilling the corn was carefully avoided.

The corn at first did not exhibit a very promising appearance, but as soon as the roots had extended into the enriching matter below, and began to expand in the sward, which had now become open and mellow by fermentation, and the parts of soil more minutely divided than it could have been by the plough or hoe, it assumed a healthy appearance, and grew more vigorously than corn which I had planted upon a much better soil, cultivated in the usual way. When the ears were filling out, a time when the corn most requires support, the roots easily penetrated the mellow soil, and an abundance of nourishment was afforded by the decomposing of the vegetable matter. The crop was harvested about the middle of September. I did not measure the produce for the purpose of ascertaining exactly the quantity which was gathered, but some of my neighbors who are good judges saw the field before harvesting, and estimated it at from 70 to 80 bushels to the acre. My usual crop on sward land cultivated in the common way, has been from 35 to 45 bushels to the acre. As soon as

the corn was harvested the stubble was loosened up by running a light horse plough lengthwise through the rows, and then the whole smoothed down by a bush harrow drawn crosswise. All this was done without disturbing the sward. A bushel of winter rye to the acre, and a sufficient quantity of grass seed was then sowed, and the ground harrowed with a light harrow and rolled. Rye has in my neighborhood, for some years past, been a very uncertain crop,—being almost invariably subject to a blast, or mildew, which attacks it while in the milk. It has however, as is the case every where, I believe with rye, succeeded better upon a new than an old soil. This circumstance induced me to believe that the new and fresh earth, which had been turned up and kept upon the top of my sward land might favor its growth, as well as prevent the mildew. I was not disappointed: the two acres gave me between four and five tons of straw, and 69 1/2 bushels of excellent grain. I had never before gathered more than 15 bushels to the acre. The grass seed sowed with the rye took well, and the appearance at present is favorable for a great burden of grass the next season. I have then with one ploughing only taken two crops from this ground and stocked it down to grass. That there has been a saving of labor will not be doubted, and that there has been an increased produce from this mode of managing greensward, the foregoing facts sufficiently demonstrated, and that the soil is substantially improved I have no doubt.

I have this season, ploughed and planted another field in the same manner as that above described, and it promises a good crop. This I intend to sow upon the furrow with grass seed alone as soon as the corn is harvested.

In answer to some of the queries of "*Dorchester*," I will state my opinion that the depth of the ploughing should be regulated by the quality of the soil, and the quantity of manure to be applied. The soil should be gradually deepened, by turning up at each successive ploughing, some of the poorer earth, that was not disturbed by the previous ploughing, until a sufficient depth of soil is attained. If a liberal dressing of manure can be afforded, the more poor earth may be brought on the surface to mix with it.

If it be intended to sow or plant sward land in the spring, the ploughing should be at as short an interval before putting in the seed as possible.—The greater the growth of the roots and tops of grasses at the time of ploughing, the more perfect will be the fermentation, and the sward by its increased toughness will be less broken by the plough and harrow. The roller loaded as heavily as may be conveniently drawn by one yoke of oxen should follow the plough as soon as may be convenient; this will smooth any unevenness of surface. Set the furrow slices close together, and thereby prevent their being torn up by the harrow, and also prevent the escape of the gases that are thrown out by fermentation. Every farmer, who has three acres of ground to till, should have a roller. One made in two parts is much preferable to that made in the usual way. After rolling, harrow with a light harrow—the more the better, provided the sod be not disturbed. The compost should then be spread on and the ground again harrowed, when it will be ready to receive the seed, either corn or potatoes, or the small grains with or without grass seed, or grass seed alone.

The strength of team should be according to the toughness of the sward, and the depth of ploughing. One good yoke of oxen and a horse, a band to hold the plough, and another to drive, were all that I found requisite to perform my work.

Howard's Plough, with a wrought iron share and cast iron mould, I have found to be the best for turning over greensward. It is the only kind of plough that I have seen, which turns the furrow flat, without breaking it; and this circumstance is owing to the turn of the mould, and its having a share wide enough to cut just as wide a slice as the mould would completely turn over.

As to the number of lands, I would make as few as possible, as the more furrow lands a lot is divided into, the more vacant barren spaces will be left, and the more labor required to fill them. Go round the whole lot, and when finished, let the outside furrow slice be taken up, in pieces that may be conveniently handled, put into a cart or drag, and placed in the vacant space (occasioned by turning the furrows outward) in the middle and corners of the lot. This will leave the whole smooth and level, prevent ridges at the sides and ends, and save the necessity of back furrows, which would give an unevenness of surface.

GOOD NEWS AND GOOD FRUIT.

We have recently been greatly and doubly gratified by learning that our friend GORHAM PARSONS, Esq. who has been dangerously ill, is now convalescent; and to receive together with this pleasing intelligence some fine samples of fruit raised and preserved by Mr. PARSONS. The health and welfare of a gentleman, who to other good traits of character, unites zeal, intelligence, and public spirit as a Cultivator, are matters which concern the public much more than the articles which usually fill the columns of newspapers.

ITEMS OF INTELLIGENCE.

BALTIMORE, April 23. *Change of Weather.* After a succession of warm and pleasant weather, with occasional showers, there was a sudden change and severe frost on Friday night, which withered grapes, fruits and vegetables, in exposed situations; and after a cold and unpleasant day on Saturday, the night set in with high wind and rain, which was succeeded by a slight fall of snow. Great injury has, no doubt been sustained by the frost, as on yesterday morning there was considerable ice. We understand that in the vicinity of Baltimore, some of the gardeners have lost nearly all their early vegetables.

The amount of revenue that accrued to the Government of BUENOS AYRES during the year 1833 amounted to 12,240,000 dollars, of which the customs furnished 9,660,366 dollars.

PIE PLANT; or, Rheum Raphaniticum.

This valuable vegetable is a perfectly palatable acid, and answers most of the purposes that apples or other fruit do to cook, preserve, or dry for winter use. The stems of the full grown leaves of this plant are at all times fit for use; they require no other preparation than washing and cutting into short pieces, and are then fit to make pies, tarts, dry, or preserve, the same as apples. The leaves are frequently from two to three feet wide, and four feet long. To have this plant produce in perfection, sow the seeds on a rich spot of ground; water them frequently in dry weather, while the plants are young; in the fall or spring following, prepare a spot of ground eighteen inches deep, and very rich with rotten manure, on this, set out the plants four feet apart each way. One plant well cultivated at three or four years old, will produce in one season, from thirty to forty weight or upwards, fit for use.

A few papers of the seed of this plant received and for sale at the New England Seed Store. GEO. C. BARRETT.

BOX PLANTS.

From Seven Hundred to One Thousand Yards of Prime BOX in good order for Planting. To be taken up at any time when ordered. Orders may be left with GEO. C. BARRETT, New England Farmer Office, or apply to THOMAS MASON, Charlestown Vineyard. It may be had on fair terms by the Yard or Hundred. m 7

MANURE FOR SALE.

At the Boston Lime Kiln, near the Mill Dam, is from 30 to 40 cart-loads of Refuse Lime and Ashes, making a rich Manure for Potatoes, Indian corn, &c. which will be sold at the very low price of \$1 per load. Also, a small quantity of air slacked Lime. 2t p

GARDEN AND FLOWER SEEDS.

An excellent collection of GARDEN and FLOWER Seeds of very best quality, in papers of 64 cents each, constantly on hand and for sale at New England Seed Store of GEO. C. BARRETT.

THE IMPORTED HORSE PHENIX.

The imported thorough bred English entire Horse Phoenix six years old last June, is offered for sale. He was sired by Antonio, dam by Comus. He has proved a sure foal getter, and his colts are very promising—and is believed to be as fine a horse as ever was offered in this market for Sale, and well worth the attention of those who feel interested in the improvement of the breed of horses. This Horse may be seen at Mr. Gilson's Stable, Hawley Street, where further particulars will be given. 2awis ap 30

SEEDS.

Just received direct from Holland, a large assortment of CABBAGE SEEDS, in small and large quantities. These are from a House upon which the utmost reliance can be placed, and the quality of Dutch Seed is found superior. a 30 GEO. C. BARRETT.

C. G. GREENE'S

IMPROVED SILK REEL—PRICE \$20—For sale at the Agricultural Warehouse, No. 52 North Market Street, and by the Patentees, Windsor, Vermont. ap 23

WHITE DUTCH CLOVER.

RECEIVED this week direct from Holland 1000 lbs. superior White CLOVER, warranted free from any kind of foul seed, and at least worth one third more than American. This will be found an excellent Grass for Pasture land, &c. a16 GEO. C. BARRETT, New England Seed Store.

MANGEL WURTZEL SEED.

300 lbs. Mangel Wurtzel Seed, raised from selected roots and not imported. This article cannot be too highly recommended for Stock, yielding 40 tons to the acre, and being a most profitable crop. Sow 2½ lbs. to the acre. For sale at New England Seed Store. GEO. C. BARRETT.

GRAPE VINES, DAHLIAS, &c.

For Sale by HOVEY & CO, No 79 and 81 Cornhill, (late Market street,) Labella, Catawba, Pond's Seedling, (a superior, new, native variety,) and choice foreign kinds of Grape vines, by the single one or hundred, well packed for transportation to any part of the country.

A fine assortment of English Gooseberry bushes, of the best kinds, including those that obtained the premium of the Mass. Hort. Society. —ALSO—

—A collection of the best double Dahlias, Bulbous Flower Roots, Greenhouse Plants, Hardy Perennial Flowering Shrubs, Honeysuckles, &c. &c. a 9

PRIZE DAHLIAS.

FOR SALE. 200 varieties of the best double Dahlias. This collection of Dahlias obtained the premium awarded by the Mass. Hort. Society the two last years.

Orders left with Messrs. HOVEY & CO. No. 79 & 81 Cornhill, Boston, or C. F. PUTNAM, Salem, will be duly attended to. apr 2

GRAPE VINES AND EARLY POTATOES.

Catawba and Isabella Grape Vines, extra large size, by the hundred or single.

Early Potatoes which obtained the premium for the last five years. For sale by SAMUEL POND. Cambridgeport, Feb. 26.

APPLE TREES FOR SALE.

3600 budded Apple Trees, consisting of Baldwins, Russets, Siberian Crab, Porter, River, Rhode Island Greenings, and Blue Pearmain. The above are very thrifty Trees, and in fine order for transplanting, being four years from the bud. Inquire of JONAS WYETH, Fresh Pond Hotel, Cambridge. March 13, 1834. 8t

GOOSEBERRY BUSHES.

25 Varieties fine imported Gooseberry bushes, just received from Scotland. GEO. C. BARRETT. m 26.

BRIGHTON MARKET.—MONDAY, May 5th, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 210 Beef Cattle, (10 unsold) 12 pairs working Oxen, 17 cows and calves, 50 sheep, and 300 swine.

PRICES. *Beef Cattle*—The limited number at market, caused some speculation and prices advanced considerably; the quality of the cattle was much better than usual. We noticed a few yoke extraordinary fine taken at 6 12 a 6 25; we quote prime at 5 75 a 6; good at 5 33 a 5 50; thin at 5 a 5 25.

Working Oxen—Sales were effected at 52, 60, 70 and 875.

Cows and Calves—We noticed sales at 18, 22, 26, and 829.

Swine—We noticed several lots taken at 54 for sows and 64 for barrows, also lots at 5 for sows and 6 for barrows, at retail 6 for sows and 7 for barrows.

SWEET POTATO SLIPS.

THIS day received from NEW JERSEY, a quantity of SWEET POTATO SLIPS in fine order, and will be sold in large or small quantities if applied for soon. GEO. C. BARRETT, ap 16 New England Seed Store.

MISCELLANY.

INVOCATION TO SPRING.

BY MONTGOMERY.

WINTER! retire,
Thy reign is past;
Hoary sire!
Yield the sceptre of thy sway,
Sound thy trumpet in the blast,
And call thy storms away:
Winter! retire;
Wherefore do thy wheels delay?
Mount the Chariot of thine ire,
And quit the realms of day.

On thy state,
Whirlwinds wait;
And blood-shot meteors lend thee light;
Hence, to dreary arctic regions
Summon thy terrific regions;
Hence, to caves of northern night
Speed thy flight.

From halcyon seas
And purer skies,
O southern breeze
Awake, arise;
Breath of Heaven! benignly blow,
Melt the snow:
Breath of Heaven! unchain the floods,
Warm the woods,
And make the mountains flow.

Auspicious to the Muse's prayer,
The freshening gale
Embalms the vale,
And breathes enchantment through the air;
On its wing
Floats the SPRING,
With glowing eye and golden hair;
Dark before her Angel-form,
She drives the Demon of the storm,
Like Gladness chasing Care.

ASTRONOMICAL.

THE distance of the star Draconis, appears by Dr. Bradley's observations, to be at least four hundred thousand times that of the sun, and the distance of the nearest fixed star not less than forty thousand diameters of the earth's annual orbit; that is, the distance of the earth from the former, is, at least, 38,000,000,000,000 miles, and the latter not less than 7,000,000,000,000. A cannon ball supposing it could preserve the same velocity, would not reach the nearest of the fixed stars in six hundred thousand years! There is goodly work enough to upset any moderate man's notion of time and space. Had this cannon ball taken its departure in the time of Cheops, or even Cheop's grandfather, (if the imagination can roam so far back into the dense blackness of the past,) it would even now be merely at the outset of its journey. Cheop's grandfather dandles young Cheops on his knee: he in turn grows up, waxes in years: builds the everlasting—in our frail acception of the word—pyramids, lives to an antediluvian age; dies, is buried and forgotten; successive generations spring up and pass away; states rise and fall; empires expand and decay, and expand again, up to this present 1834, and yet this cannon ball that has been travelling all this time with inconceivable rapidity, is as it were but a hop, step and jump on its way towards the nearest fixed star! This way of thinking will never do. It diminishes our ideas of the sombre stateliness of the past, and makes "hoary antiquity" a thing of yesterday. The bygone glories of departed empires, glooming with added grandeur

through the indistinct and spectral past, must seem to a mind familiarized with such unconscionable notions of time and space, but as things that had existence a considerable time ago, last week or the week before.

THE FEMALE.

THE following natural and true description of the parental comfort derived from female children, is from a speech of Burrows, an eminent Irish lawyer: "The love of offspring, the most forcible of all our instincts, is even stronger towards the female, than the male child. It is wise that it should be so—it is more wanted. It is just that it should be so—it is more requited. There is no pillar, on which the head of a parent, anguished by sickness, or by sorrow, can so sweetly repose, as on the bosom of an affectionate daughter. Her attentions are unceasing. She is utterly incapable of remaining inactive. The boy may afford occasional comfort and pride to his family—they may catch glory from his celebrity, and derive support from his acquisitions—but he never communicates the solid and unceasing comforts of life, which are derived from the care and tender solicitude of the female child. She seems destined by Providence to be the perpetual solace and happiness of her parents. Even after her marriage, her filial attentions are unimpaired. She may give her hand and heart to her husband, but still she may share her cares and attentions with her parents, without a pang of jealousy, or distrust from him. He only looks on them, as the assured pledges of her fidelity and the unerring evidences of a good disposition.—*Journal of Women.*

CAFFERS OF SOUTHERN AFRICA.

THEIR color is a clear dark brown, hair black but woolly.—The most prominent trait in the character of the Caffer is that of the herdsman, rather than the warrior; for he is never so happy as when engaged in something that is calculated either to increase the numbers or improve the appearance of his cattle. Such is his daily attention to these, that one out of a thousand would be immediately missed. His perfect acquaintance with every little spot on the hide, turn of the horns, or other peculiarity, after having seen an animal once or twice, is indeed astonishing, and says much for his powers of observation.

The Caffer chiefs are in all cases both legislators and judges, whilst "the old men" and favorite courtiers form a kind of jury and council too. The parties appear personally, plead their own cause, and produce their witnesses and proofs.—In their public harangues a man is seldom interrupted, although his speech be continued for hours together; but during this time his antagonist is all attention; when he rises to reply, every argument that has been adduced is taken up in the exact order in which it was delivered, and with as much precision as if answered at the very moment. Memory is their only note book; and although apparently put, on many occasions, to the severest test, they seldom seem to labor under any material difficulty in bringing up all the details of the subject by the astonishing powers of recollection. Their language on those occasions, is generally strong and nervous, and their manner exceedingly manly and dignified. Even the children when about to reply to the most simple questions, step forward, throw back the head, and extend the arm, and give their words a full, slow, and clear enunciation.—*Kay's Travels in Caffraria.*

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 5½ miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the MORUS MULTICAULIS or New Chinese Mulberry, a beautiful fruit tree, so superior for silk worms to all others.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chesnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeyuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the Pæonies, *Montan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

GOOSEBERRIES.

A new importation of superior kinds, just received, of all colors, by WM. KENRICK, Newton.

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,
1 Case wet (but not damaged) Bishops Lawn.
1 do. do. do. Book Muslin.
Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation. m 14

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table matts, 1st. a 16.

LECTURE ON HORTICULTURE,

Delivered before the Young Men's Association of Albany, March 1834. By JESSE BUEL, Esq.

NEITHER education nor habit has qualified me to address a public assembly. But the high approbation with which I have seen your association formed, and acquire strength and respectability, and the individual and public benefits which it promises in its results, have induced me to contribute my mite towards your entertainment and improvement in useful knowledge, by addressing you some brief remarks on the business of Horticulture. This subject is commended to your notice as one which contributes largely to supply our wants and to heighten our enjoyments;—as a healthful recreation to the studious and sedentary, and as surpassing most other employments in the high gratification which it is capable of imparting to the mind.

Horticulture is another term for gardening. It embraces the management of the garden, whether intended for the production of fruit, culinary vegetables or flowers. The art is co-extensive with our race. It was the employment of our first parent in Eden. Its early history is too obscure to be traced. Suffice it to say, that in the polished ages of Rome, it was cultivated with taste and assiduity, and ranked with the fine arts; and that with these it sunk to obscurity at the downfall of that empire. All of the art that survived the shock of Vandalism, remained cloistered with the monks during the dark ages. With learning too, it revived, first in Italy and Holland; to which countries many exotics, and a taste for their cultivation, were introduced during the crusades. It was not until the reign of Henry VIII, in the beginning of the 16th century, that gardening was much cultivated in England. Previous to this time, even cabbages and pot herbs were imported from Holland for the tables of the opulent. During this reign, apricots, melons, herbs, and esculent roots, were introduced first into the royal gardens. Among the varieties of that day is mentioned "the black trees which bear no fruit, but only a pleasaunte flower." Improvement in horticulture progressed under Elizabeth, and Charles I,—during the reign of the latter, the first general book of English gardening, was published by Parkinson, a work which is yet quoted with high commendation. At this time the first mention is made of potatoes, cauliflowers, celery, &c.

About the middle of the seventeenth century, several valuable publications upon horticulture appeared in England and France; and in 1724, Philip Miller published his celebrated Gardener's Dictionary, an original work of merit, which attracted general notice, and gave a new impulse to improvement. British and other foreign works on gardening, have since been greatly multiplied; and improvement has kept pace with the increase of wealth and refinement, until horticulture has attained to a high state of perfection, both as a useful and ornamental art, in most of the civilized countries of the old continent. Horticultural Societies have done much to accelerate improvement, and to multiply the subjects of cul-

ture.* The Society of London, established a garden in 1818, and sent agents into every quarter of the world, to collect whatever could be found useful or ornamental. One of these agents, after traversing the United States and the Canadas, for this purpose, has spent four years on the Pacific coast of our continent, exploring the country from California to Columbia river, and from thence across the continent to the Hudson Bay factories, in collecting rare plants and seeds. Some idea of the extent of the Society's labors, may be formed from the fact, that in its catalogue for 1830, there are enumerated as growing in its garden, 3400 varieties of hardy edible fruits, and 58 varieties of edible nuts, exclusive of 89 varieties of the fig, 182 of the grape, 56 of the pine apple, and 131 of the melon, nearly all of which last named are cultivated in houses, with the aid of artificial heat—making an aggregate of about 4000 varieties of fruits, independent of ornamental plants. This Society has been highly useful to us, not only by awakening here a spirit of horticultural improvement, but by distributing through its corresponding members among us, many of its choice fruits and ornamental plants.

From the restricted means and economy incident to a new country, gardening has with us been limited to what has been deemed necessary, seldom aspiring to elegance. The neighborhoods of our commercial towns form but a partial exception to this remark. Indeed until within a few years, the progress of horticultural improvement has been slow among us. And even now the cultivation of fruits and esculent roots, is but imperfectly understood, or their value in promoting the health, comfort and economy of a family, not duly appreciated by the generality of our countrymen. Few of the fine varieties of fruit, and other choice productions of the garden, are seen in travelling through our country. But a better taste is gaining ground. We have effected much in the last twenty years, and have abundant reason to anticipate greater improvements in the twenty years to come.

A good fruit and vegetable garden is a source of high gratification, as it regards the reasonable indulgence of the appetite. No fruits are so delicious as those we pluck from our own trees and vines—no vegetables so grateful as those which have been cultivated by our own hands—and no productions of the garden so truly good and healthful at any time, as when fresh gathered for use. But if we add to these enjoyments the pleasurable sensations which arise from the ornamental department,—from the novelty, the fragrance, and the beauty, with which nature in summer, is ever varying her pencilings upon the flower border and in the shubbery, we shall find that a garden is intimately connected as well with the pleasures of the mind, as the wants of the body.

Few of my hearers, I apprehend, have ever reflected on the extent to which we are indebted to foreign countries for the vegetable productions which enrich our tables and regale our senses. Did our gardens contain only the plants that are indigenous to our country, the supply would in-

* We have seen in a monthly publication, accounts of exhibitions at 58 of these Societies in England alone.

deed be scanty. But we have laid almost every clime under contribution to administer to our wants and to embellish our grounds. Most of our grain, and a large portion of our esculent roots, derive their origin from other countries. The greatest part of them came to us from Great Britain and Ireland, which in turn received them from Italy, Italy from Greece, and Greece from the East. Rye and wheat are indigenous in Siberia and Little Tartary; rice is the natural produce of Ethiopia; buckwheat of Asia; kidney beans of the East Indies; the beet and onion of Spain and Portugal; peas came from the south of Europe; Jerusalem artichokes from Brazil; peppers and cucumbers from India; the egg plant from Africa; the tomato from South America; pumpions from Astracan; ruta бага from Sweden; the cauliflower from Cyprus; and asparagus from Asia. Our fruits originated in countries equally remote from each other.* Without pretending to decide upon the disputed questions, whether all the cultivated apples have originated from the wild crab, or whether any of these varieties existed here when our shores were first visited by Europeans, I can say, that we have esteemed varieties of this fruit growing among us which originated on the banks of the Po and the Danube, of the Rhine and the Oder, of the Seine and the Thames;—and on the shores of the Baltic and Caspian. The peach came from Persia; the plum from Syria; the cherry from Pontus; the quince from Austria; the almond from Barbary and China; and the pear from Europe. Our pot herbs, and medicinal cultivated plants are also mostly exotic; parsley is from Sardinia; purslain from South America; nasturtium from Peru; thyme from Spain; sage from the south of Europe; savory from France; marjorum from Sicily; rhubarb from Asia; and balm from Switzerland. So of our flowering shrubs and plants. Pinks, the narcissus and daffodil, are from Italy, the Dahlia from Mexico, the ranunculus and anemone from Cappadocia, the hydrangea, balsam, aster and camellia from China and Japan, the tulip and hyacinth from the Levant, the tuberose from Ceylon, and our finest pæonies from China. And of trees, we are indebted to the north of Asia for the ornamental horse chesnut, and to farther India for the stately ailanthus. These are but a small part of the contributions which horticulture has gathered from foreign lands for your convenience and pleasure. And every year adds to the list new varieties.

The size and style of gardens vary according to the purpose which they are intended to serve, and the expense which it is designed to bestow upon them.

The royal gardens of Europe are of great extent and magnificence. That of Kew comprises 120 acres, and is maintained at vast expense. Gardens of this description are not indigenous to our country, and I trust it will be long ere they become acclimated among us.

Botanic gardens are found attached to most of the colleges of Europe, and to some few in the United States. Many of these are of considerable extent, and abound in rare exotics as well as in indigenous plants, and embrace those that are

tender, and require protection, as well as hardy species.

There are many public gardens in Europe, laid out and embellished at great expense, which serve as promenades and pleasure grounds. These are sometimes maintained at public expense, and at other times by individuals. They are found in the environs of most of the capitals and large towns upon the continent. To show how much they may be made to contribute to the pleasure as well as the health of city life, and the influence they exert upon the manners of a community, I will here quote from the journal of a travelling horticulturist, the notice of a public garden of this kind belonging to the city of Frankfort in Germany.

"This city is surrounded, except on one side where the Maine runs, with a pleasure ground or garden, at least two miles in length, and occupying the breadth of the former ditch and ramparts, and affording great variety of shady walks and picturesque scenery, with the grand advantage of being accessible from every part of the city in a few moments. One peculiar feature of this pleasure ground is, that it is not confined to trees and shrubs, but contains a profusion of the choicest flowers and roses, dahlias, chrysanthemums, &c. together with most of the choice annuals, as balsams, China asters, &c. even geraniums and *feraria tigris*, planted in large masses of each, and intermixed with vast beds of *mignonette*, all in a high state of luxuriance and beauty. Nothing could be more brilliant than the display of this garden says the narrator, when I saw it in September when the dahlias and superb clumps of *datura arborea*, *salvia coccinea*, &c. were in flower; and as a proof of the scale on which it is managed, and the attention paid to it, I may mention that the gardeners were then preparing a bed of irregular figure wholly for pinks, about 50 feet long, and from 9 to 15 broad.

This garden affords a striking proof of the great superiority of the manners of the German lower classes over those of the English. Though merely separated from the public highway by a low hedge which may be stridden across, and at all times accessible, (there being no door or gates at any time to the entrance) to every individual of a population of 50,000 souls, and constantly frequented by servants and children of all descriptions, not a flower, nor even a leaf of any one of the plants, seems ever touched. Even the beds of *mignonette* look as untrodden and unplucked, as if in an English private garden. And yet there are no persons (that I saw) to watch; and instead of threats of heavy penalties, a printed paper is affixed on a board at each entrance, expressing in German, that the public authorities having originally formed, and annually keeping up the garden for the gratification of the citizens, its trees, shrubs and flowers, are committed to the safeguard of their individual protection. This simple appeal is here sufficient."

The public ground in this city known as the military or Washington square, might, at no great expense, be converted into a public garden of this kind, and furnish a most delightful and interesting promenade during the summer, for citizens and visitors. When once put in order, it might be kept so with the avails of season tickets, at a nominal price, or the profits of a refectory, embracing the sale of spare plants, seeds and fruits. It might be surrounded by a neat fence, side walk

and a row of ornamental trees, while the interior might be laid out with taste, enriched with the choicest fruits, and embellished with ornamental shrubbery and flowers. It would also afford pleasant facilities for the study of botany to the youth of our public schools.

One of the most splendid structures for the preservation and display of tropical plants, has been undertaken at Brighton, England; and although, owing to the misconduct of a foreman, in prematurely removing some of the supports, the building fell last August, its re-construction was immediately commenced, and it will probably be completed the ensuing summer. It is called the Brighton Atrium. It is an immense conservatory, for growing plants of great height, and is constructed wholly of iron and glass, even the sashes being of iron, and requiring of this metal between four and five hundred tons. The structure had been reared, many choice plants introduced, and the glazing about being commenced, when it fell with a tremendous crash. The dome of this building was the largest ever constructed, rising 60 feet from the base of the rafters, and exceeding that of St. Peter's, at Rome, by 8000 superficial feet, and requiring nearly two acres of glass to cover it. Among the plants purchased for this splendid conservatory, were three palms, sixty feet high, for which 1500*l.* had been paid, if my memory serves me, to the Messrs. Loddiges, nurserymen of London.

Private gardens, of great extent, and on an expensive scale, abound in most of the countries of Europe. In these, not only hardy fruits and vegetables are forced, for early use, but most of the tropical fruits are brought to a high state of perfection, by the aid of hot houses and walls. Strawberries, in this way, are produced for the table in April, melons in May, grapes and peaches in June, and pine apples at almost any season. It is affirmed, that in Britain a gentleman may derive from his own garden, with the aid of glass and fire heat, a more varied and richer dessert, throughout the year, than is to be met with on the most luxurious tables in any other country. And yet the summers of England are of so low a temperature, that the peach, grape, melon, &c. require the aid of artificial heat, or a wall, to bring them to perfection; and even our fine *Spitzenburgh* apple does not ripen well there in the open ground. Gardens of this description, though generally on a more limited scale, may be found in the neighborhoods of our commercial towns, and will doubtless be multiplied as we advance in horticultural improvement. The garden of Mr. Pratt, near Philadelphia, is distinguished for the number and variety of rare plants which it contains, and for its appendages and neat arrangement. That of Col. Perkins, in the vicinity of Boston, has a range of glass houses of nearly 700 feet in length, for rearing tender plants and forcing fruit, and exhibits a pattern of good taste and neatness. I am induced to believe, that we can only succeed in cultivating the fine varieties of foreign grapes by means of grape houses. In the open ground, this fruit does not ripen well, and is very liable to be rendered worthless by blight and mildew, for which no effectual preventive seems yet to have been discovered. A grape house of 50 or 60 feet may be constructed for about \$120, which will require no fire heat, and very little labor to manage it. It will besides serve for many half hardy plants, and other horticultural purposes.

Public Nurseries, which also belong to horticultural

ture, are highly useful to all communities in which they are located. They serve to introduce and to concentrate the vegetable productions of every country, which are likely to subserve our wants, or administer to our pleasure. The interchanges which take place between those of Europe and America are now managed with such facility, that a new fruit, or a new flowering plant, which attracts notice on our continent, in a few years becomes common in the nurseries of both. The numerous horticultural periodicals of Europe, many of which circulate in our country, bring us early acquainted with whatever is new, rare or valuable in their collections, and a single season serves to introduce the desirable plant into our grounds. In this way we have been enabled to obtain the fine new varieties of Flemish and French pears, in some instances before they have fruited in England. The splendid double *Dahlia* first attracted attention in Europe some eight or ten years ago; and it is now common in our nurseries and pleasure grounds. I was instrumental in bringing into notice, five or six years ago, a fine indigenous variety of the apple, grafts of which I forwarded to Europe. I have since noticed it in the Catalogue of the London Hort. Society, with the names of many other of our local fruits, and in catalogues from the island of Jersey and from Hamburg, in Germany. The *ailantus* was introduced six or eight years ago, by one of our consuls, from farther India, and it is now growing, I believe, in almost every state of the Union. Until within a few years public nurseries have been confined to the vicinity of New York and Philadelphia; but they are now springing up in every quarter of the Union. A very interesting establishment of this kind, and one of the oldest in the country, is located on the banks of the Schuylkill, a few miles below Philadelphia. It was planted by the elder Bartram, about ninety years ago, and contains, besides the usual variety of fruit and ornamental plants, most of the beautiful native trees and shrubs of our country, collected by that indefatigable botanist. It is now improved by Col. Carr, a descendant of the original proprietor. I saw the establishment in June, when the splendid *Magnolias*, the stately *Liriodendron*, the more humble *Rhododendrons*, *Kalmias*, &c. were displaying all their vernal beauty and fragrance. The scene afforded uncommon interest. A stately cypress, measuring thirty feet in circumference, brought from the south and planted by the founder ninety years ago, occupies the centre of the grounds, and is surrounded by the oaks, pines, and other useful and ornamental natives of our forest,—exhibiting, altogether, probably the most perfect collection of American trees and plants that is to be found in any one spot.

Villa gardens are those which are attached to the country houses of men of opulence, and are generally laid out with taste, and embellished at considerable expense. They may be considered private gardens of the second grade. They are an indication of intellectual refinement, as well as of wealth, wherever they are found to prevail.

Those are denominated cottage gardens, which belong to the common class in Europe, and are most prevalent about villages and towns. While they contribute essentially to human subsistence, they afford an agreeable relaxation from the toils of labor.

Flower gardens occupy no little attention in

many European countries, and in some parts of the United States. They are cultivated not only for the amusement of botanists and amateur florists, but, particularly in France, as a source of profit, and for supplying the market. The flower market, in the French capital, exhibits a rich display, and is almost as regularly visited by the citizens, to supply their daily wants of flowers, as is the market for the sale of provisions.

Market gardens abound in the neighborhood of all large towns, and administer largely to the health and comfort of their population. Those in the neighborhood of London cover an area of more than 5000 acres; and are not only appropriated to ordinary culture, but go largely into the forcing branches of the art. Almost every kind of fruit and esculent vegetable is forced in them by artificial heat; and the cultivator finds ample remuneration for his extra labor and expense in the high prices his products command in the market. A quotation of some of these prices, which I make from the Gardener's Magazine, will not only verify the truth of my remark, but will serve to convey some idea of the horticultural luxury indulged in by the wealthy classes of the British metropolis. Forced strawberries are quoted at 4s. sterling the ounce; peas at 2l. 2s. the quart, shelled; peaches and nectarines at the same price per dozen; grapes the same per pound; cherries at 3l. 6d. per lb.; pine apples at 24s. per lb.; beans at 5s. per 100 pods; potatoes at 3s. per lb.; asparagus at 15s. per 100; rhubarb 2s. 6d. per 100; cucumbers 24s. per brace, &c. It will be recollected that the English shilling is about 22½ cents. The market gardens of our country are on a more humble scale. Few of them employ artificial heat. But if we judge of the future by past improvement, and by the increasing taste of our citizens for the rare and finer productions of the garden, we may expect to see them ere long engaged in the forcing department on a pretty extensive scale. The first market garden from which this city was regularly supplied with vegetables, was established about the commencement of the present century, as I am informed, at Whitehall. At present some hundreds of acres are appropriated to this purpose, and the business gives employment to a large number of hands.

As having particular relation to those who depend upon these gardens for horticultural productions, for daily use, I take occasion to remark, that the quality of market garden productions depends materially on the judgment and liberality of the buyers. The object of the gardener is profit; and so long as the purchaser regards the price rather than the quality, he will continue to raise those varieties which give him the greatest product. The difference in the varieties of the same vegetables are manifestly great. This exists not only in the flavor, but in their nutritious and healthful properties: some varieties, particularly fruits, being absolutely prejudicial, while other varieties of the same species are highly conducive to health. In the potato for instance, the difference in nutritive matter amounts to nearly a half in different varieties. Some of the coarser kinds, yield but 14 and 16 per cent. of nutritive matter; while some of the finer kinds have given 28 per cent. And it is worth regarding, that good quality is almost inseparably connected with grateful flavor.

Horticulture as an employment, is highly conducive to the healthful vigor of the body, and to

an agreeable exercise of the mind. The labor it demands, is neither severe in degree, nor monotonously tiresome in kind. It affords continued change and variety. The interesting subjects of which it has cognisance,—as the germination of the seed, the development of the leaf, the growth of the stock, the expansion of the flower, the swelling, maturing, and gathering of the fruit, and the diversity in foliage, flower and fruit, of the various vegetable families under its care, present to the mind capable of appreciating and admiring the beauties of the vegetable kingdom, a succession of the most agreeable sensations.

As a recreation, horticulture offers all the pleasures I have enumerated, without the fatigues, which accompany its manual operations. What more grateful pleasure to the sedentary and studious, or to him who is habitually involved in the mercenary cares of business, than the relaxation afforded by a well kept garden, which exhibits to the senses, the fragrance, the beauty, the order, and harmony, which Providence has imparted to the vegetable kingdom. Here is nothing to awaken jealousy, to excite distrust, to beget envy—or to inflame any of his grosser passions; but every object is calculated to tranquilize the mind, to soften down the asperities of his nature, and to beget towards his fellow beings, feelings of kindness, philanthropy, and love.

As a science, horticulture is rich in stores of intellectual wealth and usefulness. It embraces glossology, which teaches us the names of the parts of plants; phytophory, or the nomenclature and description of plants; taxonomy or their classification; vegetable organology, or the external structure of plants; vegetable anatomy, or their internal structure; vegetable chemistry, or primary principles of plants; vegetable pathology, or the diseases and casualties of vegetable life; vegetable geography and history, or the distribution of vegetables relatively to the earth and to man; and the origin of culture, derived from the study of vegetables. It also embraces the study of the natural agents of vegetable growth and culture—as earths, soils, and manures; the agency of heat, light, electricity and water, in vegetable culture, and of the atmosphere in vegetable development.

Whether we regard horticulture as an art or a science;—whether we consider it as administering to our wants, convenience, and pleasures, or as promotive of useful knowledge,—it has high claims to our notice and regard.

In passing the threshold of manhood, young gentlemen, with high hopes, and ardent desires, for fame and fortune, let me counsel you to cultivate a taste for this humble pursuit. Without abstracting you from business, let it at least interest you as a useful and elegant recreation. The passions in which you now indulge—the pleasures which you now pursue,—are to have in all probability, a controlling influence over your future characters and happiness. Select then those which will wear well, and set comely and comfortable in riper years. Let horticulture be embraced in the selection. Implant but the seeds, ere the soil becomes foul with weeds, and they will germinate and grow. And when the dreams and visions of youth shall have faded into sober realities; and the mind tired with the bustle and turmoil of life shrinks back upon its own resources for repose and enjoyment, then will horticulture be found capable of imparting rational and substan-

tial pleasures, and of increasing in interest with the increase of years—for of all employments a taste for this is least apt to lose its enjoyments in the wane of life.

From Goodsell's Farmer.

CANADA THISTLE.

HAVING seen a communication in your paper, over the signature of C. dated Woodland, Dec. 16, 1833, recommending as the most sure method of extirpating the Canada thistle from our soil, "to plough the ground and sow it with large red clover, which he recommends to have mowed the first and second years without seeding it, after which the land may be ploughed, and sowed with wheat, when it will be found that the roots of the thistle are perfectly destroyed, so far as regards vegetation." Having myself practised a method very similar with complete success, I was forcibly struck with the propriety and accuracy of his remarks. I cannot account for the destruction of the thistle in this case, otherwise than that the clover grows earlier and more luxuriantly than the thistle, and by overshadowing it, the thistle is kept in a dwarfish and sickly state, until the clover is mown, at which time the stalks of the thistle will be found hollow, and having a whitish, sickly appearance; and they will not immediately send up young shoots unless the clover is fed off. It is advisable to mow them in a warm clear day, and remove the crop immediately, that the sun may shine directly upon the emaciated stalks, which will not only retard their growth, but accelerate their destruction. I have written the above as the result of my own experience, and feel confident that any person who is troubled with Canada thistles, may adopt the course recommended by your correspondent C. without fear of disappointment, and that he will find his communication generally correct.

JOSEPH EDDY.

Williamson, March 4, 1834.

Note. It is a well known fact, that neither plants nor animals can enjoy good health, unless they have the advantages of light. Light is important in the elaboration of the juices of plants which is furnished by the roots, and unless they are allowed to produce leaves, and those leaves have the action of light upon them, the juices continue thin and watery; circulation becomes languid, and the plant dies of a disease as near dropsy as the nature of the case will allow.—Ed. G. F.

ITEMS.

Potatoes. Try it—Those who are fond of baked or roasted potatoes, will be gratified by trying the following method:

Place them clean in the bottom of a bake-pan or kettle, dispensing with the cover—hang them over the fire and shovel the coals on them. It will be as quick and as cheap as any other method of cooking them; and they are not so soggy as when baked under the cover, nor burnt as they commonly are when roasted on the hearth—and the flavor will be excellent.—Maine Farmer.

Ink spots. It is perhaps not generally known that a piece of blotting paper, crumbled together to make it firm, and just wetted, will take ink out of mahogany. Rub the spot hard with the wetted paper; when it instantly disappears; and the white mark from the operation may be immediately removed by rubbing the table with a cloth.

FORMATION OF KITCHEN GARDENS.

If there is one department of gardening more useful than others, it is that, the special object of which is the production and cultivation of those vegetables which contribute so largely to the support of man. The poor as well as the rich, the prince and the peasant, are alike indebted to this branch of horticulture for the larger and more wholesome portion of their substance; to all, a garden is possessed of a certain degree of importance, and all have an interest in giving to it as high a degree of cultivation as possible, in order the better to supply their wants. The culinary garden is of importance to the public, particularly in large cities; and where a proper spirit of improvement has been abroad, we will find their environs occupied chiefly by market gardens, which independently of their furnishing the tables of the inhabitants with most wholesome food, afford an honest occupation and the means of support to a large class of the population; they are thus doubly beneficial.

Important as the formation of gardens is to those "who dwell in cities," it is not less so to the farmer. Every farm-house, every cottage should have a garden (larger or smaller according to the means of the owner) attached to it. The necessity of a garden, is not, I believe, generally disputed. I am aware that almost every farm-house has a garden of some sort; but there lies the difficulty;—it is in reality a garden of *some sort*, and unfortunately, not always of the right sort. The farmer generally appears to think a garden beneath his notice; he leaves the care of it "to the women"—an arrangement which would answer admirably well, if he would only provide the 'woman' with the means of attending properly to the duty thus delegated to her. This negligence is prejudicial to the farmer's interests as well as to his comforts and enjoyments. The necessity of having a garden acknowledged, the choice rests between having a good one or a bad one. A garden will always well repay the attention and labor bestowed upon it, provided that attention be properly directed and the labor rightly applied.

In the hope of being useful in spreading the practice of gardening on just and true principles, I will offer some hints on the formation of culinary gardens, which I hope will be found useful, not only to market gardeners and others, but to farmers and farmers' wives in the country.

As a preliminary, I beg leave to observe, that "whatever is worth doing at all is worth doing well." It requires but little more outlay either of money or labor, in the beginning, to make a good garden than to make a bad one, and will cost less in the end. If there be any thing in figures, or truth in arithmetic, an article which will cost \$5, and last twelve months, is cheaper than one which costs but \$3 and will last but four or at most six months. So it is with a garden: make it right at first,—spare no labor nor expense to make it well, and it will endure; but if you begin wrong, or do the work negligently, you lose both your time, your money and labor, and will at length be obliged to begin all over again.

The first point is to make choice of a situation—provided always that a choice is to be had; for sometimes the situation of the house or some other circumstances, will take away that choice, and it will be necessary to 'locate' the garden to suit such circumstances. But where a choice is to be had, it is of great importance to fix upon a favora-

ble situation; for on that depends the prospect of luxuriant and profitable crops. It is even of more importance than choosing a rich soil; for if the soil be poor and the situation good, the former inconvenience may be remedied, but if the situation be bad, the defect is irremediable. The kitchen garden should be placed at the back of the dwelling house: but it should not be cooped up among buildings and out houses of every kind, as is too often the case. Farmers generally will find it best to have their gardens adjoining their houses as these are for the most part plain and simple: but in the country seats of the wealthy, where the principal dwelling has many offices, &c. attached, it will be an advantage to have the culinary garden situated at some distance from the mansion house; it will not then interfere with the arrangements of the pleasure ground, which the proprietor will be more at liberty to dispose in such a manner as his tastes and circumstances will suggest without neglecting or disparaging the most useful department.

In choosing a situation, due regard should be had to *shelter*; a certain degree of which is necessary; it renders the garden warmer and protects it from cutting winds, which are productive of much injury. Should the spot where the garden is to be placed be exposed to inclement winds from any quarter, no time should be lost in planting trees, which may afford a shelter from these troublesome visitors. Of course, as the object is to procure shelter as soon as possible, trees of rapid growth are obviously preferable. Care must be taken, however, not to run into an extreme, and overshadow the ground by lofty trees: in planting the trees for shelter, therefore, it will be best to plant them at some distance from the boundary of the garden. Wherever a situation can be had, already protected by nature, it must not be neglected; for a natural shelter is always better than an artificial one: such natural shelter may be caused by the form or situation of the ground. But if recourse must be had to an artificial one, let it be attended to soon. The earth should be well trenched and trees planted immediately. The Sycamore or Buttonwood may answer very well, as it grows freely; poplars are of yet more rapid growth, but they are objectionable on account of their long straggling roots: if used at all, care should be taken that these voracious appendages do not interfere with the borders. To these may be added trees of slower growth and greater durability, as oaks and elms; the chestnut may also be introduced advantageously, as it would under such treatment attain a large size, and produce fruit of superior quality; which is certainly an object, when it often sells from \$3 to \$6 per bushel. It should be borne in mind, that the best shelter for winter is formed by evergreen trees, as they retain their leaves: a large proportion of them should therefore be distributed amongst the other trees, and when they have attained a proper size, some of the deciduous trees may be cut out, and if a few only of the finest of the latter be left at judicious intervals, the effect will be highly ornamental.

The distance from the line of the garden at which these trees should be planted, must be regulated by circumstances; at the south and east they should be as far removed as possible, to keep their shadows out of the garden during the winter.

One word more as regards these plantations; be sure, in choosing your trees, to give the preference to those plants which have been grown from seed, before those which have been raised from

cuttings or layers, and above all, from suckers; the latter having always a tendency, (less or greater, according to circumstances,) to an irregular growth; whilst the former are more likely to assume the form of handsome trees.

This is a general rule; but it applies in a special manner to evergreens. It is well known that if a cedar or a cypress lose its central terminal branch, it will never become a handsome tree, unless the cultivator can find a branch so situated as to take the place of the regular one; a matter sufficiently difficult. A plant raised from the seed, is a distinct individual, has its own proper centre and will grow accordingly, whereas all plants raised from cuttings, layers or suckers, are merely extensions of some pre-existing individual, and consequently their growth is more or less modified.

I find I have rather overstepped my limits, and shall therefore, reserve the continuation of this subject for another paper, where I shall treat of situation in regard to altitude, aspects and soil, and probably also of the formation and laying out of the garden.—*Magazine of Gardening and Botany.*

From Goodsell's Farmer.

NOTHING MADE IN VAIN.

WE have this week received the following communication, accompanied with a quantity of seeds, as referred to, for which we return the donor our thanks. From the date, we have no doubt but they were intended to have reached us earlier. The discovery of this way of procuring Maple seeds, is not only a matter of curiosity, but of economy; as we venture to say that it would have required the labor of one man, at least one week, to have taken the shells from a quantity of seeds equal to those sent to us. We shall endeavor to have them planted, and will hereafter give the result.

Cultivation of the Sugar Maple and Manner of Procuring the Seed.

Mr. Goodsell—Every one is delighted to see our native forests thickly planted by the hand of nature with this valuable, and beautiful tree; valuable because for cabinet work some varieties of this wood is superior to that brought from distant climes;—first rate for fire wood, and as good for the manufacture of Sugar as the cane plant. And who does not regret the destruction of the axe-man amongst them. Occupying the best soil, they are usually the first victims. But he who destroys should endeavor to produce anew. No native tree can be more easily cultivated than this, the seed being abundant and easily procured. It grows rapidly from the seed in open cultivated grounds, attaining the height of six feet in three years, and in twelve years the stems will measure from six to nine inches diameter. I send you a quantity of seed as a specimen, they are ready prepared for sowing, and are divested of the shell, and wings; in their natural state being connected together in pairs, they are usually called Maple keys. About a peck is sufficient for seeding three acres of ground. Nature would seem to dictate the fall of the year to be the proper time for sowing the seed in their natural form, as the effect of the Frost would be to soften the shell. At this season they are scattered abroad by the winds in infinite profusion. But divested of the shell and sown in the spring, they will grow as surely as peas, and make their appearance at the time the forest trees put forth. They should be sown, or rather scattered

upon the furrows of dry land, and harrowed in, and grass seed should be sown for future pasture. Hogs, calves, sheep, horses, &c., may be pastured among them, but no cattle, till they are out of danger. The third year, either fall or spring, they should be taken up where too thick, and transplanted in vacancies. One thousand may commence growing upon an acre. In twelve years an enterprising farmer, who wishes for the future prosperity of our country, as well as to enhance the present value of his lands, would walk five miles barefooted before sunrise in the month of June, to view this "Sugar Bush" of our climate, in full foliage, situated near the residence of the owner, sheltering his fruit trees and habitation from storms, and the resort of the songsters of the air. The leaves of this grove might be collected for the barn yard. At the age of twenty-five years, the trees might be tapped. I was bred upon a farm, in a deep valley of the mountains, on the eastern border of this state, and have witnessed the growth of the Sugar Maple in groves from the seed, and also standing singly in fields, where they have stood for more than half a century, presenting a more beautiful appearance than the trees of any land, or clime. My occupation now, is farming. As to the manner of procuring the seed:—I send you about one fourth part of the winter store of a buck or woodland mouse, which was deposited in a living hollow beech tree, 15 inches diameter; the whole of his store, being about one bushel, one half beech nuts, with a few other seeds, all shelled, and neatly put up for winter provision, and a nest within, lined with down, the residence of the family. A boy found another store house the same day, which was 25th of December last, containing half a bushel of Maple seeds with others. Boys are skilful in such kind of hunting. In this way seed stores might be furnished with them, from the Maple forests of the west, in quantities sufficient to plant out Territories, and Kingdoms. The buck mouse, enters his habitation, through a smooth hole an inch or less in diameter, into the hollow of the tree, sometimes nearer, and sometimes further from the ground. At the commencement of cold weather, and snow, the red squirrel visits the place daily, and endeavors with much chattering to gnaw through, to rob the mouse of his store. By this recent gnawing around the hole, and by tracking in the snow, the habitation of the mouse may be discovered. This little animal also deposits vast quantities of elm seeds, in hollows of the branches, and trunks, of that stately tree. In the night season when all his enemies sleep, except the owl, he is busily employed during the full months, in running up and down the tree, and laying up his winter store. The habitation of the mouse, is frequently occupied afterwards, by the honey bee. Whenever the Maple bears seed, the mouse, in Maple forests, is sure to have a proportion of them for his food. S. H.

Clarendon, Jan. 25th, 1834.

From Goodsell's Farmer.

MORUS MULTICAULIS.

THE high encomiums which have been passed upon the Chinese Mulberry, by many of the nursery men in this country, within a few years past, induces us to notice it for several reasons.

First—It has already been satisfactorily ascertained, that our climate and soil are favorable to the growth of the white Italian Mulberry, and the rearing of worms for the production of silk; and

that the business can be followed with a profit, corresponding to other agricultural and manufacturing pursuits in this country, with our present knowledge of it. This being admitted, it is important that before we leave this certainty for an uncertainty, we should ascertain—Secondly; Whether the Chinese Mulberry will succeed with us, as well as the white Italian, and if so, whether it is any better for feeding silk worms.

With regard to its capability of enduring our climate, we have only to add, that a friend of ours a few days since informed us that all his Chinese Mulberries were killed to the ground, notwithstanding our winter has been uncommonly mild, more so perhaps than has been known for the last ten years.

We have examined ours, and find them killed also, which induces us to believe they will not withstand our winters without more or less injury; and, allowing that they should send up many sprouts from the roots, as their name indicates, it is doubtful whether the leaves from them will be found preferable for feeding worms, to those of the common White Mulberry, since their greatest recommendation was their size, which now is not considered so important, as it is found to be the better way, to cut off small limbs and place upon the table, than to separate the leaves from the branches.

MANAGEMENT OF SEED BEDS.

WATER occasionally the seed-beds of all kinds of trees and shrubs, in dry weather; but this must be practised both before and after the plants begin to appear.

Observe at all times to water these beds with moderation; a little and often must be the rule. Likewise be very careful not to apply the water over hastily at any time, for that would be apt to wash the earth away from the seed, and also from the young plants now beginning to come up; being particularly careful of the more tender and delicate sorts:—generally let the refreshments of water be repeated moderately once every two or three days in warm dry weather; for this will be of great service to all such kinds of seedling plants.

Shade will also prove very beneficial in the middle of hot sunny days, to many of the choice kinds of seedling trees and shrubs, about the time of their first appearing, and for some time after.

These young plants may be shaded from the sun occasionally, by fixing hoops across the beds; then let mats be drawn over the hoops as often as occasion requires.

Where there are boxes, pots, or tubs of seedling plants, let them be placed in a shady situation, about the middle, or towards the latter end of this month, where they may have the morning sun only.

All beds of seedling trees and shrubs, whatever, must be kept perfectly clean from weeds.

This should be carefully attended to, for the weeds are much quicker of growth than the young seedling plants of trees and shrubs, and would soon get the start of them if permitted to stand, and would do much damage. Therefore let the weeds, as soon as they appear in the beds, be cleared out, before they get to any great head, performing it by very careful hand-weeding.

Care of new-planted Articles. Water new plantations of the tenderer kinds of young evergreens and flowering shrubs, &c. but in particular those

which were lately planted out from the seed beds; these must not be forgotten in dry weather.

Once a week will be often enough to water any new plantations, even in the driest season, and to those that are but lately planted: but such as have been planted in autumn or early in the spring, will require but very little watering.

Cuttings, either of fruit or forest-trees, flowering-shrubs, or evergreens, which were planted last autumn or this spring, must also be watered now and then in dry weather.

Transplanting.—Evergreens, of most sorts, both seedlings and others, remaining in too close growth, may yet be transplanted; but this should be forwarded as much as possible in the beginning of this month, or wholly completed by the middle, in all the requisite principal plantings.—*Gardener's Calendar.*

BOYS ASYLUM.

THE Annual Meeting of the Boys Asylum was holden on Monday, at 4 P. M. at the Institution in Salem street. We learn that in consequence of a notification sent to each contributor, the meeting was numerous, and the subject of a union with the 'Farm School' was very fully discussed. In order to ascertain the opinion of the Meeting respecting the proposed Union, the question was taken, and passed nearly unanimously. This is not, however, definitive, as the subject was deemed too important to be settled without due deliberation. A committee of six was appointed to report on the bye-laws, terms of union, &c. at an adjourned meeting, to be holden at the Institution, on Monday next, at 4 o'clock.

We understand that the Farm School is located at Thompson's Island, but a short distance from the city, containing 140 acres of excellent land.

The Farm School Government last year erected a commodious wharf, and a large barn, and commenced a spacious building, capable of accommodating more than one hundred boys—which will be completed early the ensuing fall, and we hope the union will take place, because we believe the public good will be promoted, and a larger number of boys than could possibly be accommodated in the city proper, will be thus provided for, and at no increase of expense to the community.

The following gentlemen were elected as the Government for the present year:

His Honor, Samuel T. Armstrong, *President*—Rev. Francis Parkman, Thomas B. Curtis, Simon Greene, Arthur French, George Darracot, Samuel Terrey, Samuel Lawrence, Moses Grant, William Gray, *Vice Presidents*—Win. Hale, *Treasurer*—E. S. Raud, *Secretary*.

THE RAILROAD FROM SOUTH AMBOY TO BORDENTOWN.

—MAY be considered one of the most important and perfect works of the kind in this country, not excepting that from Baltimore to Fredericktown. The former being now the great thoroughfare and connecting link between the two metropolitan cities of the Union, which it has brought as it were into the same neighborhood, and within a few hours ride of each other, has doubled the amount of travelling between the two cities, and will always be enabled to sustain itself profitably from this source even after it shall have been prolonged completely to Camden, opposite Philadelphia. The Messrs. Stevens deserve the lasting gratitude of their countrymen for this spirited enterprise.—*N. Y. Star.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MAY 14, 1834.

FARMERS' AND GARDENERS' WORK.

BONE MANURE. There is no part of farm management of more intrinsic importance than that of procuring, saving, and making the most of every substance, which will serve either for the stimulus or the food of plants. This subject has, indeed, been very much discussed, but still we believe it possible to suggest some ideas in relation to it, which may be in some measure new and useful to some of our readers.

The value of bones for manure is not so well understood as could be wished. A writer for the *Gardener's Magazine* is of opinion that bone-dust is the best of all possible manures. He says, "I make use of all the bones I can by any means (robbing church-yards excepted) collect, for the use of my vine and other fruit borders, also for asparagus beds. For such purposes they answer the most sanguine expectations. There is much difference in the quality of bones."

The *Worcester Herald*, an English paper, has the following paragraph: "The use of ground bones as manure, particularly for turnips, is now becoming general in the counties of Angus and Perth in Scotland. Mr. Watson of Kieler farm, near Cupar Angus, says: 'The bone manure has been a great blessing to the breeders and feeders of cattle in this district, and, in some instances, saved the industrious tenant from ruin. The severe drought of 1825 did not prevent a crop of turnips with bones, while all other manures failed; and it was thus the means of bringing through that disastrous winter herds of cattle, which must have otherwise perished for want of fodder.'"

Willich's Domestic Encyclopædia states that "A. St. Leger, Esq. had once laid down to grass a large piece of very indifferent limestone land, with a crop of corn; and from this uniformly well-dressed piece he selected three rods of equal quality with the rest, and manured them with bones broken very small, at the rate of sixty bushels per acre. Upon the land thus managed the crop was infinitely superior to the rest. The next year's grass was also more luxuriant, and has continued to preserve the same superiority for at least eight years, inasmuch that in Spring it is green three weeks before the rest of the field. He also dressed two acres with bones, in two different fields, prepared for turnips, at sixty bushels to the acre, and found the crops incomparably more productive than the others managed in the common way. Upon grass-lands he observed that this kind of manure exerts its influence more powerfully the second year than the first. For whatever soil it be intended the bones should be well broken, before they can be equally spread upon the land. No pieces should exceed the size of small marbles. To perform this necessary operation, he recommends the bones to be sufficiently bruised, by putting them under a circular stone, which being moved round upon its edge by means of a horse, in the manner tanners grind their bark, will very expeditiously effect the purpose. Although bones of all kinds may be used to advantage, yet those of fat cattle are undoubtedly the best. A. St. Leger has also found it very beneficial to mix ashes with the bones; a cart-load of the former being put to thirty or forty bushels of the latter, and heated for twenty-four hours (which may be known by the smoking of the heap,) when

the whole should be turned. After lying ten days longer, this excellent manure will be fit for use."

A writer for the *Gardener's Magazine* says, "A good way for gardeners to collect bones for vine borders, and other purposes, is to make known in the neighborhood, that they will give so much per hundred weight for all that is brought to them. As they are received they should be broken by hammers into small or large pieces, as the effect is intended to be immediate and powerful, or gradual and prolonged. For distant effect, a number of bones should be buried whole; on the same principle that opium enters envelope pills in paper, to retard their dissolution in the stomach."

The *New England Farmer*, vol. ix, p. 245, contains a letter from the Hon. J. LOWELL to Hon. THOMAS L. WINTHROP, in which the writer makes observations on an experiment he had made, proving the utility of bone manure for wet meadows. The following are extracts from that valuable communication:

"A few years since, the Hon. William Ellis of Dedham recommended to me the use of the head and feet bones of oxen as a highly valuable manure on meadow lands. He said that he had observed in passing that I had grounds remarkably well adapted for this manure. I however neglected this hint, though I constantly kept it in mind, until the last year, when seeing an immense load of the heads of oxen passing by, I inquired of the owner for what purpose he was carting those materials, and he answered me to the following facts, viz. That he came down a distance of eight miles, with an empty team, and was carrying back a load which cost him two dollars, to put on his meadow land. I found it was no new experiment with him, and that he came often for that purpose.

"Here then I had facts. I knew the habitual economy of our citizens, that they were not remarkably prone to idle experiments, or to wanton expenditure.

"I entered with my very intelligent informer into many particulars as to the process and effects, but I own that I was more impressed with the simple fact that he would devote his team and labor for a day, and pay two dollars for his materials besides, than with all his other assertions. * *

"I made the experiment. Its success surpassed all his descriptions. The manure brought in new grasses, it encouraged and invigorated the old. * *

"The mode of application is to break them up with a sledge, or with the back of an axe, and then to press them below the surface with a rammer or beetle."

For the *New England Farmer*.

NEW MODE OF CULTIVATING MELONS.

MR. FESSENDEN—I noticed in the *N. E. Farmer* some remarks on the Culture of Melons, from a T. S. P. of Beaverdam, Virginia, which, coming from a warmer climate than ours, may not command the attention which perhaps they deserve from our New England cultivators.

The most successful cultivator of Watermelons in this town with whom I am acquainted, Mr. William Goodale, plants them on the southern side of loose gravelly knolls, diluvial hillocks, consisting almost entirely of small pebbles and sand mixed with a very little vegetable mould. On this most barren of soils he digs holes, uses well rotted manure mixed with the soil, and seldom fails of obtaining a good crop. He says, in the hottest and

dryest weather, the vines never wilt, and that all the heat which accumulates in these warmest spots of earth in New England is necessary to bring the melons to perfection. DANVERS.

Dear Sir, The foregoing remarks, made by a practical observer of things, may suggest an useful idea to some of your readers; and I know of no better disposition to make of them than to forward them for your paper.

Your obt. servt. J. W. PROCTOR.
May 3d, 1834.

ITEMS OF INTELLIGENCE.

The *Baltimore American Farmer* is discontinued, and a new paper entitled "*The Farmer and Gardener, and Live Stock Breeder and Manager*" was commenced on the 9th inst. as successor to that "ancient and honorable" publication. We are sorry for the loss of the *original Farmer*, but as the present appears to be a worthy substitute we shall neither make long faces nor long paragraphs about the matter, but proffer the same hand of friendship to the Offspring, which we have ever extended to the Parent.

Early Vegetables and Fruits. Mr. G. W. Lee exhibited to us yesterday, a Mushmelon perfectly ripe, measuring twenty-two inches in circumference, and a quantity of potatoes, from the garden of Mr. EPHRAIM HOLBROOK at Hyde Park. They were raised without any artificial heat, but of course under glass cases.—This is the most remarkable instance of early vegetation that has ever come to our knowledge and will afford a useful hint to our gardeners as exhibiting how much may be accomplished by a little care and attention.—*N. Y. Eng.*

Cucumbers. We received yesterday from Mr. Camp, the Horticulturist, a piece of cucumber vine, from his hot-bed about six inches long, and having more than fifty cucumbers set upon it. This, however uncommon it may appear, is, we are assured not accidental, but the effect of cultivation; as many specimens of the kind can be produced from the same bed at this time.—*Washington Intelligencer.*

Early Melons and Potatoes. We were yesterday permitted to touch and handle, but not to taste, two fine ripe nutmeg melons, one of which was twenty-two inches in circumference, the produce of the garden of E. Holbrook, Esq. of Hyde Park, Dutchess County. In the same basket also, were two or three quarts of new potatoes, of good size for the pot. These early fruits and vegetables were sent down by Mr. H. for exhibition at the Horticultural Society. The melons were as fragrant as though at their proper season.—*N. Y. Com. Adv.*

In the town of Easthampton, two extensive button manufacturers have this spring discharged from their employment sixteen hundred hands, "in consequence of the curtailment of business, and want of confidence in the Atlantic cities."

A family in New Haven, Conn. have made a public request through the newspapers, that certain young gentlemen, who have been for some time in the habit of *serenading* the household, would have the goodness to abstain from further inflections. Their music is pronounced intolerable.

The town of Marblehead contains five thousand inhabitants, and cannot support a lawyer, the last one being obliged to emigrate for want of business. Marblehead has however, in former days, furnished some of the first legal talents in the country. Chief Justice Sewall, and Judge Story, were natives of that place, as was also Vice President Gerry, and the venerable Dr. Holyoke.

New Potatoes were for sale in the Faneuil Hall Market this morning, at T. Griggs' Stall, No. 88.

Eight thousand shad were recently caught at a single haul at Howel's Fishery; and so plenty are they in Philadelphia, that they are selling at three and four dollars a hundred.

PARA, (South America,) March 24. Business generally is at present so wretchedly bad and produce so enormously high, owing to the recent currency laws, that one does not know what to do. The greater part of the copper money has been called in by the Government, and before many days pass, the remainder will also be for which paper is to be issued. How the change will act on commerce, time only can determine. From the first of May all duties are to be paid, half in paper and half in silver, which will have the effect of lowering produce to less than half its present nominal value.

Accful Calculation. An ingenious, authentic, and valuable statistical work, published a few years since, states that the number of inhabitants who have lived on the earth, amount to about 35,627,843,275,075,846. The sum the writer says, when divided by 3,096,000, the number of square leagues of land, on this surface of the globe, leaves 11,320,698,732 persons to each square league. There are 27,864,000 square miles of land, which being divided as above gives about 1,314,522,076 persons to each square mile. Let the mile be reduced to square rods, and the number he says will be 1,853,173,500,000, which being divided as above, gives 1283 inhabitants to each square rod, which rod being reduced to feet and divided as above, it will give about five persons to each square foot of terra firma on the globe. Let the earth be supposed to be one vast burying ground, and according to the above statement, there will be 1283 persons to be buried on each square rod, capable of being divided into twelve graves, it appears that each grave contained 100 persons, and the whole earth has been one hundred times dug over to bury its inhabitants! supposing they had been equally distributed.

VALUABLE NEW WORK ON AGRICULTURE.

This day Published—by GEO. C. BARRETT, at the Office of the N. E. Farmer, and by LILLY, WAITT & Co.—THE COMPLETE FARMER and RURAL ECONOMIST, by THOS. G. FESSENDEN, Esq.—a work which every farmer ought to be possessed of. Particular account of the work next week.

FULL BLOOD SHORT HORN HEIFER CALVES FOR SALE.

Four full blood Short Horn Calves for sale from Imported Stock, sire and dams, if application is made in one week to the Publisher of the New England Farmer, he will furnish particulars as to prices, ages, &c. may 14

HALL'S IMPROVED HAY RAKES.

Just received, and for sale at the Agricultural Warehouse, 50 dozen of the first and second quality of Hall's best warranted Hay Rakes. my 14

SEEDS.

Just received direct from Holland, a large assortment of CABBAGE SEEDS, in small and large quantities. These are from a House upon which the utmost reliance can be placed, and the quality of Dutch Seed is found superior. a 30

GEO. C. BARRETT.

WHITE DUTCH CLOVER.

RECEIVED this week direct from Holland 1000 lbs. superior White CLOVER, warranted free from any kind of foul seed, and at least worth one third more than American. This will be found an excellent Grass for Pasture land, &c. a 16

MANGEL WURTZEL SEED.

300 lbs. Mangel Wurtzel Seed, raised from selected roots and not imported. This article cannot be too highly recommended for Stock, yielding 40 tons to the acre, and being a most profitable crop. Sow 2½ lbs. to the acre. For sale at New England Seed Store. GEO. C. BARRETT.

MACHINE FOR CUTTING FODDER.

THE simplicity of the construction of this Machine, and the small probability of its getting out of repair, together with the neat and rapid manner that it performs its work, certainly renders it a desirable article for the purposes for which it is intended. It is constructed on an entire new principle from any heretofore invented, and will cut an hundred weight of hay in ten minutes, two inches long, can also cut any length from three inches to one-fourth of an inch; it is fed by placing the fodder in a hopper that stands perpendicular, the knife playing horizontally underneath, by which means all the complicated machinery for feeding and the power necessary to drive it is avoided.

The Subscriber having become the proprietor of the right of making, &c. said machine, in and for the State of Massachusetts, solicits the public to call and examine for themselves. Said Machine is for sale at the store of PROUTY & MEARS, No. 12 Commercial street, Boston. DAVID P. KING,

Who is also Agent for the States of Vermont, New Hampshire, Maine, and Rhode Island. a 2. eowgw

COMPLETE SET OF THE FARMER.

One complete set of 11 Volumes of the New England Farmer, bound in excellent style. For sale at the Farmer Office. This will be found to make a valuable Library for an Agriculturist.

NEW WORK ON FLOWERS.

Just published, the Florist's Manual, with Eighty beautifully colored Engravings, being the best work adapted to American Floriculture extant—price \$2.50. GEO. C. BARRETT.

ZINC WARE.

Just received, a further supply of Zinc Milk Pans, Kettles and deep Bake Pans, and for sale at the Agricultural Warehouse, No. 51 and 52 North Market Street.

The manufacturers of this article having closed their works, no more of them can be procured at present,—and as the season is at hand when these are most wanted, and as they are found on trial to produce a great increase of Milk, they are highly recommended to the public as one of the improvements of the day. my 14

BOX PLANTS.

From Seven Hundred to One Thousand Yards of Prime BOX in good order for Planting. To be taken up at any time when ordered. Orders may be left with GEO. C. BARRETT, New England Farmer Office, or apply to THOMAS MASON, Charlestown Vineyard. It may be had on fair terms by the Yard or Hundred. m 7

MANURE FOR SALE.

At the Boston Lime Kiln, near the Mill Dam, is from 30 to 40 cart-loads of Refuse Lime and Ashes, making a rich Manure for Potatoes, Indian corn, &c. which will be sold at the very low price of \$1 per load. Also, a small quantity of air slacked Lime. 21 p

GARDEN AND FLOWER SEEDS.

An excellent collection of GARDEN and FLOWER Seeds of very best quality, in papers of 63 cents each, constantly on hand and for sale at New England Seed Store of GEO. C. BARRETT.

PAINT OIL.

The subscribers keep on hand a constant supply of their "Prepared Paint Oil," which is offered for sale with renewed assurances of its merit. This Oil, independent of being 25 per cent. cheaper in price, will actually cover a quarter more surface, as has been repeatedly proved and confirmed by statements of many Painters. Upwards of 200 buildings in this city and vicinity can be referred to, many of them painted two years ago, which continue to look well, and retained their gloss through the first year, which is a clear demonstration of its strength. The Prepared Paint Oil is found to answer a valuable purpose to mix with Linseed Oil, giving it strength and durability with a more permanent gloss. It paints a very clear white, flows smooth, and is more free from mildew, and changes resulting from the sea air, than any other Oil.

Oil Factory (head Foster's Wharf.)

DOWNER & AUSTIN.

P. S. Please be particular to order Downer & Austin's "Prepared Paint Oil." m 19 6pis.

BRIGHTON MARKET.—MONDAY, May 12th, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 290 Beef Cattle, (unsold 12) 8 pairs working Oxen, 15 cows and calves, and 230 swine.

PRICES. Beef Cattle—Arrangements having previously been made between many of the Drovers and Butchers, a large proportion of the cattle were sold "by the lump," consequently prices were very unequal, but at a considerable advance, say from 12 to 25 per head, on an average, from last week, for the same quality; we shall omit definite prices until the market shall become more settled.

Working Oxen—Sales were effected but we did not learn the price.

Cows and Calves—We noticed sales at 17, 20, 24, 25, 27, 30, and \$45.

Swine—Market very brisk—no large lots were sold, but an unusual number were retailed at 6 for sows, and 7 for barrows; a few which were small and very fine, were taken at 7 for sows and 8 for barrows.

C. G. GREENE'S

IMPROVED SILK REEL—PRICE \$20—For sale at the Agricultural Warehouse, No. 52 North Market Street, and by the Patentees, Windsor, Vermont. ap 23

MISCELLANY.

BIRTH DAYS.

"My birth day!"—What a different sound
That word had in my youthful ears;
And how, each time the day comes round,
Less and less white its mark appears!
When first our scanty years are told,
It seems like pastime to grow old;
And, as youth counts the shining links
That time around him binds so fast,
Pleased with the task he little thinks
How hard that chain will press at last.
Vain was the man, and false as vain,
Who said, "were he ordained to run
His long career of life again,
He would do all that he had done,"
Ah! 'tis not thus the voice that dwells
In sober birth days speaks to me;
Far otherwise—of time it tells
Lavish'd unwisely—carelessly—
Of counsel mock'd—of talents, made
Haply for high and pure designs,
But oft, like Israel's increase, laid
Upon unholy, earthly shrines—
Of nursing many a wrong desire—
Of wandering after love too far,
And taking every meteor fire
That cross'd my pathway, for his star?
All this it tells, and could I trace
The imperfect picture o'er again,
With power to add, retouch, efface
The lights and shades, the joy and pain,
How little of the past would stay!
How quickly all should melt away—
All—but that freedom of the mind
Which hath been more than wealth to me;
Those friendships in my boyhood twined,
And kept till now unchangingly;
And that dear home, that saving ark,
Where love's true light at last I've found,
Cheering within, when all grows dark,
And comfortless, and stormy round!

HISTORICAL SCRAPS.

JULIUS CÆSAR fought 50 pitched battles, and killed one million and a half of men. **Manlius**, who threw down the Gauls from the Capitol, had received 23 wounds, and taken two spoils before he was seventeen years of age. **Dentatus** fought 120 battles, was 30 times victorious in single combat, and received 45 wounds in front; he had among his trophies 70 belts, 8 mural, 3 obsidional, and 12 civic crowns. **Cato** pleaded 400 causes and gained them all. **Cyrus** knew the names of all the soldiers in the army. **Lucius Scipio** knew the names of all the Roman people. **Chimedes** could relate all he ever heard, in the same words. **Julius Cæsar** wrote, read, dictated, and listened to the conversation of his friends at the same time. A philosopher is mentioned by **Pliny**, who being struck with a stone, forgot his alphabet. A man reputed for his stupidity, fell from his horse, and being trepanned, became very remarkable for the sprightliness of his genius. The orator **Carvinius** forgot his own name. **Mithridates** spoke to the ambassadors of 22 different nations without an interpreter. **Julius Viator** lived to an advanced old age, without drinking water, or using any kind of liquid nourishment. **Crassus**, grandfather to the **Triumviratus** who was slain by the **Parthians**, never laughed.

Conundrum.—Why are good singers like Cod-fish? Because they have nothing better than tongues and sounds.

A CASE OF EMERGENCY.

An Irishman, who made an honest penny by swapping horses, and taking something to boot, once attempted to cross a river at a high freshet, with his only remaining mare and colt. He was washed from the back of the former, and seizing the tail of the colt, buffeted the angry waves, much to the dissatisfaction of the "crater." His friends on the banks of the river, seeing his perilous situation, and his frail support, called out to him to leave the colt and take the mare. "Oh! botheration to ye," exclaimed Pat, in all his tribulations, "it's no time jeutlemen to talk about swapping horses."

ALTERED HABITS OF THE LADIES.

The ladies have made their "state more gracious" by reducing the size of their bonnets, for which relief much thanks. When the sleeves shall have recovered from the swellings with which they have so long been affected, our beauties will look more beautiful yet; for when it is recollected that, in military tactics, eighteen inches is the space allowed for a soldier's breadth in line, it must seem rather disproportionate in a lovely girl of eighteen to occupy at least three times as much ground as a grenadier.—*New Monthly Magazine*.

DIFFERENCE BETWEEN SOLAR AND ARTIFICIAL HEAT.

A remarkable difference has always been observed between the calorific rays, emanating from the sun, and those emitted from terrestrial sources, even of the most intense heat, viz.; that the former can pass through glass, without suffering any apparent diminution, whilst the latter cannot pass through the same substance but in an almost insensible quantity. The experiment is easily made: expose yourself to the sun, and afterwards to the fire of a chimney; interpose a large square of glass to the passage of the rays on the face—the sensation of heat from the solar rays continues without any sensible alteration, while it completely ceases from those of the fire.

Researches sufficiently extensive proved to **M. Melloni**, that this essential difference in the nature of solar and terrestrial heat, depends on a simple mixture of many sorts of rays, in various proportions; that is to say, that the heat of both one and the other, is like light, composed of many rays, and that rays of the same kind are not found in the same proportions.—*Journal Hebdom.*

From the Zion's Herald.

A GOOD WIFE.

A good wife will help to improve the fortune of her husband. No man ever prospered in the world without the consent and co-operation of his wife. Let him be ever so frugal, regular, industrious, intelligent, successful, all goes for nothing if she is profuse, disorderly, indolent, or unfaithful to her trust. "By much slothfulness the building decayeth, and through idleness of the hands, the house droppeth through." But, O! how good a thing it is, and how pleasant, when the gracious intentions of God and nature are fulfilled! With what spirit and perseverance does a man labor in his vocation, when he knows that his earnings will be faithfully disposed, and carefully improved. With what confidence will he resort to his farm, to his merchandise—fly over the land, over the sea, meet difficulty, meet danger—if he has the assurance that he is not spending his time and strength and vain; that all is well and safe at home;

that indulgent Heaven has crowned all his other blessings with that of an help-meet for him, a discreet manager of his estate, a fellow laborer with him from a sense of duty, from interest, and from affection. This is the portrait of a good wife, drawn by the pencil of inspiration.—(Prov. xxxi. 10—31.

JOSEPH.

Winchendon, April 24, 1834.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of **WILLIAM KENRICK** in **NEWTON**, 5½ miles from Boston, by the City Mills.

This nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated *Pears alone*, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus Multicaulis* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chesnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the *Pæonies*, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early. Address to **WILLIAM KENRICK**, **NEWTON**. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with **GEO. C. BARRETT**, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

GOOSEBERRIES.

A new importation of superior kinds, just received, of all colors, by **WM. KENRICK**, **Newton**.

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

1 Case wet (but not damaged) Bishops Lawn.
1 do. do. do. Book Muslin.

Also, 1 do. Superfine 6-4 Cambrie Dimities, which will be offered by the Piece at 25 per cent. less than cost of importation. m 14

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 100 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table matts. islf. a 16.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

From the Quarterly Journal of Agriculture, Mechanics and Manufactures.

GROWTH OF FLAX AND MANUFACTURE OF LINEN IN THE UNITED STATES.

SIR—I would not subscribe to the opinion of Dean Swift, that "he who makes two blades of corn, or two spires of grass, grow where one grew before, does more essential service to mankind than the whole race of politicians put together;" but I firmly believe, that he who points out to honest industry a source of individual and national wealth, renders more benefit to mankind than he who astonishes the nation with his eloquence in exciting the flame of party spirit.

In this belief, and with this object in view, I take the liberty to offer you a few remarks on the culture, management, and manufacture, of flax; not, however, with any expectation of effecting so desirable an object as to place that article on the footing to which it is entitled among the productions of our country, and on which footing it is destined to stand at no very distant period, in spite of the caprice of fortuitous circumstances; but merely to suggest a few rude hints, which may call the attention of better talents to the subject, and perhaps serve as a kind of nucleus to a body of better information respecting it.

The older inhabitants of our country remember when cotton, either as an article of agriculture, manufactures, or commerce, was scarcely known in this country; and when, even in Europe, the principal acquaintance with it in a manufactured state was in goods imported from India. At that time, though the price of a pound of cotton was fifty cents, or more, the southern planter could not afford to separate it from the seed even at that price. Linen was then nearly the sole article used for under dress, or for fabrics used as household furniture.

But the ingenuity of two or three men has turned the scale. Mr. Whitney invented a machine to separate the cotton from the seed, and Hargrave and Arkwright machines to spin it; and the labor of producing the finest fabrics, with the additional help of the power loom, is now almost annihilated. In the space of a few years linen is almost expelled from market and from use, and cotton has become the basis of the manufacturing interest, and the main pillar of our exportations.

But this entire revolution in the use of the two articles is in no degree owing to their relative value; but to a remarkable concatenation and succession of accidental circumstances, which, had the order of the causes and circumstances been reversed, would have produced a completely reversed effect.

For many uses, the decided preference due to linen over cotton is abundantly proved by its still being purchased, at a much higher price, by those who can afford it. The money which would have purchased one pound of cotton and paid for spinning it into coarse yarn, before the application of machinery to cotton manufacturing, would now buy eight yards of handsome cotton cloth, finished in a superior style; but the price of flax is the same now as fifty years ago. In the spinning no

improvement of much importance has yet been effected; and in weaving, even the common fly shuttle is still but partially introduced. But the reduction in the cost of cotton goods, though more than three hundred per cent., is not the only advantage which cotton has gained over linen; it has improved as much in perfection and beauty as in cheapness.

And yet, I repeat it, the present commanding superiority which cotton has gained over linen, is not owing to its relative intrinsic worth, but to the caprice of adventitious circumstances. Had it been the good fortune of flax to have been the subject of the improvements of which it is susceptible, it would have held at this day, as distinguished a rank in agriculture, commerce, and manufactures, as is now occupied by its more fortunate rival, though it can hardly be reckoned amongst the articles of American production; and what there is is scarcely entitled to the name.

Nothing but total abandonment can now put cotton back to the place it occupied a few short years ago; and nothing but a little ingenuity, sustained by proper enterprise, is wanting to advance the progress of linen, at least in a corresponding ratio.

To effect this object it will be necessary to commence, not only by laying anew the foundation, but by preparing the ground on which to lay it. To make the business of flax-growing successful, a judicious location is of serious importance. Dry, windy, mountainous situations can never compete in the growth of flax with warm alluvial vallies, with rich and sufficiently dry soil, but moist atmosphere. When such a situation is selected and duly prepared, especially by the extermination of every weed, for flax cannot, like hemp, outstrip the weeds in growth—when it is skilfully sown with good seed,—nothing farther, except a good fence, is wanting to insure the agriculturist a good and profitable crop, provided he is met at the proper point by the manufacturer, and a market thereby opened.

But this meeting must take place when the flax is taken from the ground and bound in bundles. If it is intended for fine fabrics, this must be done while the stock is yet green; if for coarse, then the seed will be suffered to ripen, and will be retained by the farmer; but, in either case, the flax from that period must be transferred to the care and management of the manufacturer. No essential improvement can even begin to take place so long as the separating the flax from the stock, or, as it is commonly called, dressing, continues to be the business of the farmer.

The labor of dressing, as it is now performed, is, generally speaking, worth more than the flax when dressed, so that all the expenses previous to that operation are completely lost. Therefore no judicious farmer will spend his time in producing it; and of course, the American market can never afford a regular supply for any extensive operations.

It can never stand in competition with cotton so long as it is spun by hand; and it never can be profitably spun by machinery so long as it con-

tinues to be gathered in small parcels from different sources, and consequently of different qualities—dressed and prepared by different hands—some of it long, some short, some coarse, some fine, some clean, some foul, some harsh, some soft. It cannot be spun to any advantage by machinery, so long as the same parcel contains staple of different lengths, because the distance between the front and back roller must be in proportion to the length of the respective fibres; and if the rollers are sufficiently near to suit the short fibres, then the long ones will be held fast at both ends, and if far enough apart for the long fibres, then the short ones will want support: in either case the work cannot go on. If fine flax be mixed with coarse, they cannot be drawn into fine twist, and the fine fibres will not unite with the coarse to form a smooth thread, and of course a waste of stock is occasioned by spinning fine flax into coarse rough twist.

It has been abundantly proved by numerous experiments, that flax of nearly uniform length may be spun by machinery with far more rapidity than cotton; and it is no less evident that it may be drawn to any degree of fineness which the staple will admit of. But still, owing to the above causes, nothing of much importance has yet been effected.

To remove these evils, which prevent any essential improvement in the manufacture of linen, there exists but one remedy. The farmer must obtain and avail himself of due information as to the best mode of managing the culture and growth of flax, until, as before stated, it is taken from the ground, properly dried, either in its green state or after being divested of the seed and bound in bundles. In this state it must pass into the hands of the manufacturer. The price may be fixed by the ton or hundred.

The first business of the manufacturer must be to assort it into different parcels, according to the length, texture, and other properties. By this process the qualities of each parcel will be sufficiently uniform, and each may be spun with hitherto unknown rapidity and evenness of thread, and as fine as the fineness of its fibres will admit.

The next process will be that which is commonly termed rotting, or preparing the fibres to separate from the inner stock, which constitutes the shives, and from each other. The quickest and safest, and without doubt the best method of effecting this, now in use among the most skilful producers of flax, is water-rotting. It is not the intention of this article to give any detail of the manipulations in rotting or dressing flax, nor in the subsequent operations of spinning and weaving, but merely to awaken and invite the attention of inventive genius to make improvements, where reason and science declare that improvements can absolutely be made.

To make improvements in the processes of rotting and dressing certainly opens a field for interesting experiments, both to the chemist and mechanic. How far the former can be aided by the application of steam, or by the chemical agency of chlorine acid, or by any other chemical agency, is

a question worthy of serious attention, and not of very difficult solution, especially to one who possesses the requisite science and the means to make the experiments.

The operations of dressing, fining and softening, open a most extensive and interesting field to the inventive and enterprising mechanic. It is this part alone which now retards the progress of improvement. Let ingenuity do for flax in this branch of the business what Mr. Whitney has done for cotton, and the rest of the business is so far accomplished that we shall soon see the linen manufacturing interest at least successfully competing with cotton.

It cannot but be obvious to any man of talents, as a general mechanic, that the simple operation of dressing flax may be expedited to almost any degree required; and that even without the aid of any great complication of machinery. This object may not perhaps be effected at once, but let it once be fairly commenced, and meet with any degree of liberal patronage, and successive improvements will complete the race.

When the flax is dressed, and is entirely clean from shives, the next step in the process will be *fining*. The principles of this operation may be learned from ancient experience, wherever it has been long in practice, particularly in Holland and in Ireland. The fibres of flax seem to be susceptible of longitudinal division, almost to infinity. It would be difficult to reduce a fibre of flax so fine but it may be split in two. But the laborious and tedious process by which this part of the business is now effected, could not fail to suggest to an ingenious mind that it is infinite lengths behind the improved state of the age. The business of softening is nearly connected with the fining, and much in the same state of improvement, or rather in the same want of improvement.

When these processes shall have received and profited by the attention they merit from ingenuity—when flax is grown and delivered to the manufacturer in a clean and thrifty state—when it is duly sorted according to its qualities—when it is dressed clean, fined, and softened, it will then, and not till then, be fit for spinning by machinery, and weaving by the power loom. We may then expect to see flax of superior quality making as respectable an item in the exports of the northern, eastern, and western states, as cotton now makes in those of the southern. We may then clothe ourselves in linen at as cheap a rate as we can now do in cotton, and in finer fabrics than it has ever yet produced.

The first adventurers in the manufacture of linen, on the principles here laid down, will find themselves amply compensated in consequence of the high price which the goods manufactured by hand must necessarily bear; and the farmer will find a new source of profit in taking his load of flax to market and selling it at a fair price; without having to go through the (to him) hateful and unprofitable labor of dressing it. The country will see itself in possession of a new and very valuable article for its use, and the patriot will have the satisfaction to see his country acquire a new and important source of wealth and independence.

SAMUEL BLYDENBURGH.

Lansingburgh, Feb. 11, 1834.

He that follows his recreation instead of his business, shall in a little time have no business to follow.

From the Mechanic's Magazine.

ADVICE ON THE CARE AND MANAGEMENT OF TOOLS.

From a new edition of the Cabinet Maker's Guide, we quote the following;—The goodness of saws, chisels, and other edge tools, depends upon the quality of the steel, which should be uniform without, and it is always better to have them tempered too hard than too soft, for use will reduce the temper. If at any time you wish to restore the temper, and to perform the operation yourself, the best method is to melt a sufficient quantity of lead to immerse the cutting part of the tool. Having previously brightened its surface, then plunge it into the melted lead for a few minutes, till it gets sufficiently hot to melt a candle, with which rub its surface, then plunge it in again, and keep it there until the steel assumes a straw color, (but be careful not to let it turn blue,) when that is the case, take it out, rub it again with the tallow, and let it cool; if it should be too soft, wipe the grease off and repeat the process without the tallow, and when sufficiently hot plunge it into cold water, or water and vinegar mixed.—By a proper attention to these directions, and a little practice, every workman will have it in his power to give a proper temper to the tools he may use.—If a saw is too hard, it may be tempered by the same means; if you are near a plumber's shop, you may repeat the process conveniently and without expense, when they are melting a pot of lead. In other cutting tools you must wait till the steel just begins to turn blue, which is a temper that will give it more elasticity and at the same time sufficient hardness.

A CURIOUS HORTICULTURAL ANECDOTE.

WHEN Sir Francis Carew had rebuilt his mansion house at Beddington, in Surrey, he planted the garden with choice fruit trees. There he was visited by Queen Elizabeth;—and Sir Hugh Plant in his Gardens of Eden, tells a curious anecdote relating to one of these visits. "I conclude," says he, "with a conceit of that delicate knight, Sir Francis Carew, who, for the better accomplishment of his royal entertainment of our late Queen Elizabeth, led her Majesty to a cherry tree whose fruit he had of purpose kept back from ripening at least one month after all cherries had taken their farewell of England. This secret he performed by straining a tent, or cover of canvass, over the whole tree, and wetting it now and then with a scoop, as the heat of the weather required; and so by withholding the sunbeams from reflecting upon the berries, they grew both great; and were very long before they had gotten their perfect cherry color; and when he was assured of her Majesty's coming, he removed the tent, and a few sunny days brought them to their maturity.

From the Northern Farmer.

PLANTING POTATOES.

As the season for planting is approaching—and as some of our farmers, as it would seem, are not sufficiently sensible of the loss they sustain, by planting small potatoes, or what to me seems very little better, cutting the eyes from the larger ones, and planting from three to five pieces in a hill, I am induced to enter my protest against this practice, as one that is decidedly prejudicial to the crop, and ought to be abandoned.

I was educated to believe that potatoes of the above description were as good as any for seed; and that a good crop depended not on the goodness

of the seed, but on the goodness of the ground and the manner in which it was prepared. I had practised on this principle to a considerable extent, selecting the smallest potatoes for planting, or cutting the eyes from larger ones, in the manner above stated. The correctness of this practice, however, I was disposed to doubt for some years before I finally abandoned it, which I did immediately after trying what to me appeared a fair experiment on the subject.

Four years since [1830] at the season of planting, the ground for my potatoes (about two acres) was heavily manured, with fresh manure from the barn-yard and stable, and the manure thoroughly ploughed under. Near the middle of the field I planted eight rows—two with small potatoes and pieces having one eye each, cut from larger ones, putting four or five pieces in a hill, according to my former practice—four rows with large potatoes cut directly across in the centre, between the seed end and the stem or butt end, planting two rows with the seed ends and two with the butt ends, and two rows with whole potatoes of the middling size. The ground on which these eight rows were planted was level, and otherwise in all respects equal throughout. At the time of harvest, each pair of rows were dug and measured separately. The difference between the produce, from the two rows planted with small potatoes and pieces and that from the two planted with good sized whole potatoes, was something more than one-fourth, nearly one third in favor of the latter. This difference was not in the number of potatoes, but in the size; the greatest number being found in the two rows planted with the small potatoes. From this experiment, I was satisfied that to select small potatoes for planting, or to plant large and small ones promiscuously, was an error of no small consequence to the farmer. In the rows from the butt ends, and from the seed ends, the produce was nearly equal in quantity; but the potatoes from the butt ends were largest and most equal in size, while those from the seed ends were more numerous with greater disparity of size. The product of these last rows, though better than that from the small seed, was nevertheless inferior to that from the rows planted with the large whole potatoes. The result of my experiment clearly proved that though one half of the seed might be saved by cutting large potatoes in two equal parts, yet the difference of product in favor of the whole potatoes rendered them preferable for planting.

I have been considerably engaged, for the last ten, or twelve years, in experimenting upon different kinds of the potato, for the purpose of ascertaining which is the most valuable for keeping late in the spring, taking also into view their productiveness.

I should be highly gratified to have the views of some of your intelligent correspondents, who can speak from experiment on this subject. There is a manifest difference in potatoes in these respects, and it is of importance that farmers should possess the best varieties. MATTHEW BUELL, Jr.

Newport, April 23rd, 1834.

Carrots for Live Stock. The Altringham carrot, grown in rows 18 inches apart, and the carrots at the same distance from each other in the rows, the roots attaining the thickness of a man's thigh, and the length of three feet, with a vigorously growing top, for feeding cows or other cattle.—*Louden's Magazine.*

ROADS.

HIGHWAY surveyors as they are called in New England, are chosen annually in town meeting—assessments are made upon the inhabitants, and they are called upon to work them out. The object of one half of those who thus congregate together, "with pick axe, hoe and barrow" is in reality to work out the tax in the easiest way possible, instead of working on the road, and they generally succeed in working the public out of the whole of it. Nothing very permanent is done; a good shower often washes away the work of twenty or thirty men who have most patiently stood over their task the whole day, watching the going down of the sun with one eye, and the surveyor with the other. We speak from experience, having worked upon the roads in various capacities. It has been our lot to sojourn and pay taxes in as many as three or four counties in the State.

Within a few years past we have paid over one hundred dollars tax in work upon the roads, and we are fully convinced that twenty dollars in cash judiciously expended by a permanent surveyor, who was possessed of a moderate portion of common sense, would have done more good than the whole amount that we have paid in work.

If towns would raise in cash, say one half only of what they raise in what is called work, and would let the roads out to honest and responsible contractors, they would have roads that it would be a pleasure to travel, and in reality at a much cheaper rate. Somebody would then be under obligations to keep the roads good, and towns would not have to meet so many bills of cost, in paying for the broken heads of unfortunate travellers. Scarcely a court sits in either of our counties but some delinquent town is arraigned for bad roads. Somebody has received damage in consequence of bad roads; and the whole posse comitatus of the law, from crier to Chief Justice is employed to find out who is to blame; a fine and bill of costs is finally saddled upon the town sufficient to make turnpikes of all their roads and keep them in repair for years. One or two towns have adopted the plan of paying their road taxes in money, and have found by actual experience that they have better roads at one-half their former expense.—*Maine Farmer.*

From the Genesee Farmer.

FARMER'S DIARY.

It may excite a smile, on the part of many of my brother farmers, to be told that they would experience many beneficial results from the practice of making memorandums of every day's transactions; yet I may be able to convince them that such is the fact, and that, however unaccustomed to the use of the pen, there is hardly one of them but what may briefly note in the evening of each day the business which he or his men have transacted. And practice will render it more and more easy.

Surely it would be a satisfaction to every one to know how many days his hands have been engaged in preparing the ground for a crop, how much seed he used, at what time he ploughed, planted, sowed or hoed, and at what time his crop was harvested, and what the product. I should also suppose there would be an advantage in knowing at what time to expect his stock to bring forth their young, that he may afford them the necessary attention.

If he employ men in his hay or harvest field, to be able to ascertain from his diary who were

employed each day, or if driven from the field by rain, at what hour, that when settling time shall come, he may know to an hour how long each one has been employed.

By preserving an account how many shocks of wheat, oats or barley, he has deposited in stacks, or in the barn, or how many loads of hay he has secured, he may form some judgment how much of each he may have to sell. By keeping an account how many baskets of corn, or potatoes, he has drawn in, it is easy to estimate, by measuring the basket, how many bushels he has, and of course how his land has produced.

When he thrashes his grain, and cleans it up to know exactly how many bushels his acres have produced; and if he have put them in at different times, different quantities of seed, or have varied in the mode of preparing the ground, to know which has done the best. I say to be able to ascertain all these points by an examination of his diary, must be attended not only with satisfaction but profit.

A farmer has a pair of oxen which he concludes to fat. He notes their value at sixty dollars,—begins to feed—an account is kept of what they consume. He sells them at sixty-five dollars, and ascertains in a few moments whether he is paid for fattening.

I can say from experience, that it does not occupy more than ten minutes to make an entry of the day's business, and that all the benefits I have enumerated, and many more may be realized.

It is the practice of many farmers to guess that they have so many bushels of wheat, corn, oats or potatoes per acre, and this guessing is oftentimes very wide from the truth. Or if they take the trouble to measure, they forget all about it before a year comes round.

Without preserving such an account, how is it possible for the farmer to ascertain whether he gets paid for his labor; or if he have made experiments to keep an account of the results for his future guidance?

And when noting the business of the day, how easy to add in a few words, the state of the weather, thus: snow with high wind, N. W.

This practice would enable the farmer, when enjoying his fireside, in the winter, to review his operations for the past year, and to discover where he might have done better, and of course he would be qualified to pursue his business to more advantage during the coming season.

ONTARIO.

From the Kennebec Farmer.

POSTS.

THERE have been some remarks published in the *Genesee Farmer* upon the subject of setting posts butt-end up, in order to ensure more durability. We were last summer informed by Mr. North of Augusta, that he set several years ago two posts near the river at the landing in Augusta, not far from the Kennebec Hotel. One of the posts was set butt-end up, the other was placed the butt-end down. He states that both were equally sound when placed in the ground, but that the one which was set butt-end up, is now sound and good, and that the other is decayed.

His mode for accounting for the difference in preservation is the following, viz. that the tubes in the wood through which the sap ascends while growing, are furnished with valves or separations, to prevent the weight of the sap from pressing back.

That if the posts be set in the ground with the small end up, the moisture would rise in the same manner that the sap did, and thus hasten a decomposition of the wood, but if set in the other position the valves or partitions would prevent the moisture from rising at all. This theory is plausible, but whether true or not we cannot say, or whether setting a post with the small end downwards will cause it to last longer than otherwise, we cannot say, from any experience that we have yet had ourselves. One method however, is certain, viz. charring as mentioned by Carolus. And we have also found that by heating the whole of the post even if it be not charred it will increase its durability.

There seems to be a sort of low state of vegetable life remaining in wood even after it has been cut for some length of time; and the action of this vitality does seem, in a manner inexplicable to us, to produce decay. The shipwrights in the English navy-yard have become aware of this sort of morbid life, if we may so speak, and they have adopted the plan of soaking their ship timber in a weak solution of corrosive sublimate, in order to destroy this kind of action and preventing what is called the dry rot in timber. We have lately received the February number of the *Mechanic's Magazine* in which we find some remarks on the subject of preventing the decay of timber by saturating it with lime.

From the United States Gazette.

THE LOCUSTS.

A VERY respectable inhabitant who has resided in Germantown during a life of 74 years, mentions the curious fact that locusts not only appear every seventeen years, but that they make their appearance in great numbers always on the 25th of May. Our informant recollects their advent on the 25th of May, 1766, then six years old; he has since recorded their coming on the 25th of May, 1783

25th of May, 1800

25th of May, 1817

Their holes may now be seen in ploughing, or under boards laying on the ground, preparing to come forth on Sunday, 25th inst.

It is remarked that occasionally a few locusts are seen creeping out of their hiding places before the 25th, but they return again to join the great crowd.

Some two months since, a highly respected friend, who has resided all of his long and useful life in the vicinity, left for us a notice of the approach of the locusts, and an account of their time and customs.—The piece did not reach our hand until it had appeared elsewhere. It was instructive with reference to this subject, and contained a remark that the locust seasons had usually been characterized as those of plentiful harvests of grain, &c.

ITEMS.

Death to Caterpillars, &c. 'We can affirm from almost daily experience, that strong lime water will kill every kind of caterpillar, and even worms, snails, lizards, frogs, toads, snakes, and fishes.'—*Gardener's Mag.*

Soap Suds sprinkled on trees from a common garden pump is recommended as retaining its efficacy longer than lime water. When applied to trees in the early part of the year it seems to prevent insects from settling upon them.

Steaming has been tried with better effect than smoking to clear ships of vermin.

From the Genesee Farmer.

THE CULTIVATION OF INDIAN CORN.

ALTHOUGH Indian corn is the most important crop with which we occupy our land, it is the very one which receives the poorest management. Not a season passes which does not afford me frequent opportunity for observing the inexcusably negligent manner in which farmers cultivate their corn. They (a majority of them) begin wrong, continue wrong, and as a matter of course, end wrong. In other words they do not plough well, plant well, nor hoe well, and under such circumstances, how can it be expected that they will receive a large crop? It is too often the case that farmers entertain the idea that any person is competent to plough who is large and stout enough to hold on to the handles of a plough; hence the mistaken yet frequent practice of setting boys and stupid careless men to plough a rugged field to receive a crop of corn. There is scarcely a principle in the whole routine of farming operations, more directly opposed to the interests of the farmer, than that it is not necessary to perform this operation in the best manner possible. There is another idea too common among farmers, and which is almost or quite as fatal as the former, viz. that any one who is stout enough to lift a hoe, is qualified to plant corn; and a third notion, which caps the climax of error, is, that if the ground is so managed, as to keep the weeds from actually hiding the corn, it is sufficient. Such mistaken, inconsistent and delusive ideas, are cherished by hundreds and thousands of our farmers. It is this system of slack management, running through their whole plan of operations, which keeps so many farmers poor. *Thorough work* is the best motto for the farmer. Thus much by way of preliminary, and now for my own practice. I do not however, enter upon a detail of my own plan of operations with the idea that it is better than all others, but simply with the honest motive, that there are some who will find hints contained in it which will benefit them.

My first step towards raising a crop of corn is, to remove from my field all obstacles to the plough, by which I am enabled to make, with a certain prospect of success, my second step, viz:

Ploughing—which I perform with a good stout yoke of oxen, and a well shaped cast iron plough. The management of the plough I do not entrust to others, when circumstances will allow of my attending to it myself—for I find that I cannot hire my ploughing done so well as I can do it myself; and in performing the operation, I spare no pains nor time, to do it as well as it can be done. I make it a point to have every inch of sod inverted, and if from any circumstance this cannot be done with the plough, I immediately stop my team and do it with my hands. Do not start at this, brother farmer! but remember that it is not possible for you to have your ground too well ploughed for any crop. If you cannot plough but little a day, plough that well, for it is quicker and easier to plough than to hoe.

Rolling—This I do with a roller six feet long by twenty or twenty-four inches thick, made of solid white oak timber. By going over the ground with a roller as heavy as such a one necessarily must be, in the same direction as that in which it was ploughed, it is put in a fine state of preparation for the next and a very important operation.

Harrowing—which I perform with a heavy four square (as it is commonly called) harrow, contain-

ing twenty slender, sharp iron teeth, steel pointed. I make it a rule to harrow until my ground is very mellow, without any regard to the length of time which may be required in order to accomplish this object.

Marking out—I do with four chains, fastened with one end on a pole, three feet apart, which pole is supported and drawn by two men (one at each end) across the field in a different direction from that which was last taken by the harrow.

Planting—Before planting my corn, I wet it with soap, and then roll it in plaster. I obtain the most careful men I can find for assisting me in planting—make it my rule to put my seed on mellow earth, all lumps being kept out of the way, and none being drawn over the seed, which I cover lightly with fine earth.

First hoeing—As a preparation for this important operation, I enter the field with my cultivator, passing it through the corn twice in a place both ways. This leaves the ground very mellow, and in excellent condition for hoeing. I suffer no weeds to be hurried in the hill, but have them all carefully pulled out. If the earth above the plants is baked, I have it displaced, and substitute that which is mellow.

Second hoeing—It is common among farmers, even those who have a cultivator, (and every farmer should have one,) to use a plough to prepare their ground for a second hoeing. I have done so myself until the last year. I had two fields planted with corn. I prepared one of them for the second hoeing with the plough. When about to enter the other, I thought of trying the cultivator,* doubting however, whether the experiment would be a successful one, for the corn was then two feet or more high. But after some hesitation, I hitched my horse to my cultivator and went at it, and more complete, satisfactory success I could not have wished for. There was less corn broken down than would have been with the plough, and the sod was left entirely unbroken; the ground as mellow as a garden bed. In my second hoeing I leave the ground as level as possible, taking care not to make a hill about the plants, so that their roots may be left to shoot along horizontally near the surface of the earth, and get to themselves the heat of the sun as soon and as direct as possible.

Harvesting—This I do by cutting up at the root as soon as the corn is glazed; make a bundle containing eight hills, and a stook containing eight bundles, bound very tight around the top with one hand.

After planting and before the corn comes out of the ground, I strew over the ground about half a bushel of corn to every three acres, or a bushel to six. The birds will pick up this corn, and not meddle with that which is growing. If the birds are numerous and hungry it may be necessary to sow the field a second time. The year before last I suffered very much from having the birds pull my corn; last year I tried the experiment of sowing corn over my field, and had not a single plant pulled up afterwards. It is cheaper to give the birds a bushel of corn, than to have them pull what would produce 25 or 50 bushels, which they often do, and have done for me. I have found no scarecrow so effectual for the protection of young corn, as to feed the birds with as much as they will eat.

* I wish those who have never tried the cultivator for the second hoeing would do so. I have no doubt of their success.

I plaster my corn after the first hoeing.

I came near forgetting one thing, viz: the amount of seed used. Last season I followed Judge Buel's advice, and put into each hill from six to eight kernels. At the first hoeing I sent one person ahead to pull out all the plants but the four healthiest ones in each hill. The consequence was, that throughout my field there was rarely a hill which had not its stout four stalks. I would strongly recommend this plan to others.

And now, Messrs. Editors, I have made out a long story about raising corn. Whether it is worth publishing you may judge.

Respectfully, &c.

W. P. W.

Milton, Saratoga Co. Feb. 1, 1834.

From the Maine Farmer.

CANADA THISTLE.

As the season has now arrived, when most people are commencing breaking up their gardens, I take the liberty to trouble you with a few lines on the subject of the CANADA THISTLE, and the method I adopted to extinguish them from my garden. Some years since I purchased a piece of land in this town, and erected my dwelling house on the north side of the road, and about four rods distant therefrom, intending to have my garden for my vegetables in front of my house, and between that and my house. But after I had broke up the ground and planted it with potatoes, I found I had selected my garden spot completely in a bed of Thistles. The more the ground was stirred, the more the Thistles increased. I was very loath to be disappointed in improving that same ground as my garden spot. A thought occurred to my mind that by having the ground well dug up and broke to pieces very fine, with a long tyned fork, the roots of the thistles might be extracted from the earth, so as to leave but very few in the ground. Accordingly the next spring, I procured a fork made with four tynes, about ten inches long, and the fork about one foot wide. With this instrument I commenced digging up my garden, and as I dug up the ground, I pulverized the lumps, and left the roots of the thistles on the top of the ground, where in a very short time, they began to wilt, and I had no further trouble with them.—Thus by this mode of process yearly, I have entirely eradicated them from my garden.

NORTH DIXMONT.

North Dixmont, April 23, 1834.

INJURY TO FRUIT TREES FROM MICE.

While on this subject I will say, I have lost many valuable trees, both in my nursery and young orchards, say one thousand, by the noted severe winter; and, this is not all: I have suffered the loss of hundreds by the depredations of mice. I have ploughed my ground partly with the view to ward off this evil; but they have lodged under the furrow, and have occasionally walked into my nursery, and destroyed many of my trees the past winter. My loss within a few years at least is \$500. This way of losing property is very aggravating. It seems to be too much to bear with, from such a race of insignificant beings, without hope of remedy. Can there be no means devised to conquer and destroy this mischievous race, within the limits of reasonable expense? Our nation suffers the loss of millions of dollars annually, by these enemies; and yet there seems to be no inquiry as to any means of destroying them.—*Northern Farmer.*

LOCUSTS.

It appears that the seventeen-year Locusts (*Vi-cada septendecim*) are to pay their periodical visit this year. It has been ascertained that the insect appears, periodically, once in seventeen years, and in the spring of the year. They were observed in this country at the stated intervals from 1749 to 1817. Apprehensions are expressed that they will commit great ravages, and it is asserted that more than once, when they visited some parts of New England, they not only ate up all the grass in the fields, but actually attacked *clothing* and *fences* to appease their insatiable hunger. But the *Encyclopædia Americana* informs us that they are in no way injurious to vegetation, except from the damage done by the female in depositing her eggs—while the insect is itself the favorite food of various animals, and in this way may be turned to good account. Hogs devour them eagerly, and some of the larger birds are fond of them. The Indians consider them a delicate food when fried. In New Jersey they have been converted into soap.

In various parts of the world, from time immemorial, these insects have been used as food for human beings. For this purpose, in some countries, they are caught in nets, and when a sufficient number is procured, they are roasted over a slow fire, in an earthen vessel, till the wings and legs drop from them; when thus prepared they are said to taste like craw-fish. The locust constituted a common food among the Jews, and Moses (Levit. xi, v. 22,) has specified the different kinds which they were permitted to eat.

It has been disputed, however, whether the food of John the Baptist, in the wilderness, was the insect locust, or a fruit of the same name.—*N. Y. Farmer*.

From the Northern Farmer.

GRAFTING.

THE usual mode is to cut off the stock, limb, or whatever is to be grafted, pare the stump, split it, and prepare a scion by forming the butt of it wedging, to suit the split, having care that the part that sets in the rind of the stump is thickest. I will notice a misconception here. The idea is, that the two barks take first; nay, that the bark is all that unites; that as long as the two barks fail to unite, the scion must fail to start. This is not a fact: it is the circulation of the sap in the wood that supports the scion, while there is little or none in the bark. Try the experiment on any tree: by beating off its bark you can start no sap. Cut a little into the wood, and the sap will immediately flow: hence it is, the grains of both woods being equally open, that the flow of the sap in the stump passes into the scion, and the air being kept out, that the scion is supported. Thus it is necessary that the scion be taken down equally on both edges, so as to come in complete contact with the stump. It may be observed, that the two barks never unite until the scion is swollen, and often full leaved. The bark inevitably shrinks and dies at the wound on the outside, and grows anew before they can unite. The idea that the wood does not unite is erroneous. I have examined them, and have found that both the wood of the scion and the inoculated bud early and closely unite. Thus it is necessary that the two woods be placed fairly together in both cases. I have a new method, to me, of grafting; that is, to take away the earth from around the stock, make an incision near the root, with a sharp knife, downward, inclining a little in, so

that the lower part will be a little within the bark. I take a scion, and slope it from one to one and a half inches, wholly on one side, bringing it perfectly to a point, having care not to start the bark. I then take a little of the outside bark from the back side of the lower end of the scion, leaving it a little wedging at the extreme point. In this form I thrust my scion fairly to the bottom of the incision, and then bring it snug to the stock, binding it with coarse strong yarn. I then replace the earth, covering the whole a few inches, with nothing more applied, leaving the scion out in proportion to the length you may choose to have it. As this was an experiment with me, I varied much in the length of the scion, and found no detriment from either extreme. In this experiment I was successful beyond my expectations: for it seemed to be a blind work. I think I set forty or fifty scions in this manner, and I do not recollect of any one failing or faltering in the least. The old stock should be cut away as soon as the scion is well united and growing. I put frequently two to a tree, and cut away some of the inferior ones. These grafts continue to thrive as well as any set in any other manner, and all the reason I can give for not practising this mode is its being more slow. It is a sure and a simple way of grafting, and may be recommended especially to those who are timid about cutting off a tree to graft, having a distrust of their ability in the art of grafting; or to those who have but a few trees and do not value a little pains. This mode is applicable to other fruit, as well as apple trees. I recollect I have a thrifty plum tree grafted in this manner, in a wild red cherry stock of three years' growth. I will observe that the yarn bound round for the benefit of the scion needs no loosening, it rots sufficiently fast. All the advantages and disadvantages taken into view, I think this mode can be recommended, for grafting at the ground, above any I am acquainted with. ABEDNEGO ROBINSON.

SECURING A CROP OF FRUIT ON PEAR TREES.

TAKE a pair of scissors (such as are used in thinning grapes), and go over the corymbs of flowers, or rather of flower-buds, as soon as they are sufficiently elongated to allow the points of the scissors to pass between them (that is, some days before the blossoms are expanded), and thin them; leaving only five or six blossoms in each, according to the size of the corymb; always preferring to leave the flowers which have the stoutest stalks, and those which are nearest the centre. This operation has the effect of diverting the sap to the flowers which remain, and gives them sufficient strength to set from one to three fruits in each umbel; which will prove a sufficient crop, and well repay the labor bestowed. Another mode, less tedious than the above, is also practised here, with success, on young trees. It consists in deferring that part of the pruning of them which is termed shortening the young wood, until the blossoms are in about the same state as is described in the above directions for thinning, and then shortening them back to the required length. This also checks the progress of the sap, and enables the tree to set fruit very freely. I am aware that my plan is a tedious one, and one that is almost impracticable on a large scale; but it is decidedly an excellent plan for dwarf trees in gardens, whether they are cultivated in the *quenouille* mode, against walls, or as espaliers; as these trees come within

the reach of the hand, of a pair of steps, or of a ladder.

In the hope that these remarks may, through your indulgence, avail my fellow-laborers in horticulture, at the coming season, I am, sir, yours, &c.

BERNARD SAUNDERS.

Nursery, Island of Jersey, Dec. 6, 1833.

We recommend the above article to the particular attention of young gardeners. The system of disbudding advised in the preceding paper by Mr. Callow, and that of thinning out blossoms suggested in the above paper by Mr. Saunders, are applicable to all fruit trees, and, if generally adopted, would insure important results. We know an instance of a large apple orchard, the property of a commercial gardener in Kent, in which a knife has never been used: every thing is effected by disbudding, and pinching out young wood with the finger and thumb. The proprietor is not a scientific gardener; and he adopted the above practice from no particular theory, but simply from his own observation and experience, to save labor, and to insure good crops of large fruit. We hope to see his orchard next summer, and to report on it.—*Loudon's Magazine*.

TRANSPLANTING RUTA BAGA.

MEAD ATWATER, of Brighton, has called at the office, and communicated to us verbally, his success in cultivating the Ruta-baga the past season.

Mr. Atwater informs us that he sowed the seed about the middle of June, on seed beds, and when the plants were a suitable size, transplanted them out at suitable distances. The plants were afterwards hoed and kept clear from weeds. At the proper season for harvesting he went over the ground with a sharp garden hoe, and struck off the tops which he afterwards gathered up with a rake. He then with a dull hoe pulled the turnips out of the ground. The produce he thought was at least one thousand bushels per acre, and the quality as fine or finer than those which had been allowed to stand where they were sowed.

Mr. Atwater expressed himself in favor of transplanting, instead of sowing the seed where they were to grow, for the following reasons: that it saved once hoeing, which he thought more labor than to transplant them. That the ground might be ploughed at the time of setting, and would continue in better condition for maturing the crop than when ploughed earlier in the season.—*Goodsell's Farmer*.

POULTRY IN PARIS.

THE annual consumption of poultry and small game in Paris usually amounts to ten millions of kilogrammes (near twenty-two millions of English pounds.)

Of this quantity one-third is of prime quality, and sells at 1 fr. 40 cent. per kil.; one-third of second quality, at 1 fr. 20 cent. per kil.; and one-third of common quality, at 1 fr. per kil.; averaging 1 fr. 20 cent. per kil., (or about 5½d. per lb. English,) which is also the average price of butcher meat.

After the revolution of July, when the large game of the royal forests was destroyed, it was with difficulty that it could be sold in Paris at 40 centimes per kilogramme (2d. per lb.)

It is calculated that the inhabitants of Paris consume annually at the rate of between twelve and thirteen kilogrammes of poultry per head.—*Quarterly Journal*.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MAY 21, 1834.

FARMER'S WORK.

Pigs in Clover. Judge Peters of Pennsylvania observed "In summer my hogs chiefly run on clover. Swine feeding on clover in the fields will thrive wonderfully, when those (confined or not) fed on cut clover will fall away." Dr. Deane, likewise, remarked "Green clover is known to be good feeding for swine. To prepare a pasture for them let the ground be broken up, tilled and manured, and then laid down to clover. For swine are more fond of this grass than of any other which our country produces. Let the quantity of land be so proportioned to the number of swine that they may keep the grass from running up to seed. This will prevent waste, and the shorter the grass is the sweeter it will be, and the more tender and agreeable to their palates."

"I suppose that one acre of rich land in clover will support twenty or more swine, large and small together, through the summer; and bring them well forward in their growth, but they should have rings on their noses to prevent their rooting out the clover."

"It should be remembered that the pasturing land with swine will enrich it more than pasturing with other beasts, and hereby the profit of the farmer will be increased. And if a common clover lay will produce a good crop of wheat, much more may be expected from the same ground after pasturing swine upon it; as their manure adds much to the fertility of the soil."

If in May, or any other part of the season, the grass of a hog pasture should not be quite sufficient to support the hogs, some potatoes or other food may be added. The fence about the pasture had better be so tight that the hogs will not need yoking, because yokes impede their growth. But the hogs should be well ringed; or it is said by English writers, that shaving off the gristle from the noses of young pigs with a sharp knife will answer the purpose of preventing them from rooting, and injure them less than ringing."

It will be a great advantage to a hog pasture to have plenty of water in it through the summer. Running water is best, as it will afford them the most wholesome drink, and at the same time serve as well as any other for them to wallow in; and it keeps them clean, which is no small advantage."

But the most dirty puddle water is better than none, as they can cool themselves in it in hot weather, which is greatly refreshing to them, and conducive to keeping them in health."

Dr. Deane observed "When it can with convenience be so ordered it is an excellent piece of husbandry to make a hog pasture of an orchard. Their dung is allowed to be the very best manure for trees. They will keep the ground light and loose; destroy insects that infest the trees; and feed heartily on the premature apples that fall, which the farmer is too often tempted to grind up for cider. And the shadow of the trees will be very grateful and comfortable to them in summer. An orchard may be prepared with clover as well as any other spot of ground. But it should be remembered that when the trees in an orchard are young and small, swine should not be permitted to go among them: For there will be danger of their wounding them and stripping off some of the bark."

Apples are an excellent food for swine. They

are good raw, but better if boiled and mixed with meal. A writer for the Brattleboro' Reporter observes, "I have tested by ten years' experience the value of apples as food for animals. I keep five or six hogs in my orchard on nothing but apples and a little swill; and have uniformly found them to grow and gain flesh faster than hogs fed upon any thing else but grain. On the first of November they are very decent pork; after which I feed them about six weeks on grain before I kill them; and I believe I have as fat hogs and as good pork as my neighbors, who give their hogs double the quantity of grain that I do to mine."

CULTIVATED DANDELION.

We doubt whether any vegetable is more improved by culture than the Common Dandelion, *Leontodon Taraxacum*. We believe that Gen. H. A. S. DEARBORN is the first person who in this country attempted to raise this vegetable in a garden, by planting it in rows, and subjecting it to the same treatment which is afforded to hoed crops. Notice of his experiment, and its successful result, was published in the *New England Farmer*, vol. vi, p. 337, May 16, 1828.

Since that period we have heard of several persons having been successful in the garden-culture of the Dandelion. But we believe that the following may be considered as the *cap sheaf* of all experiments in attempting to domesticate this valuable vegetable. Mr. G. Pierce of Charlestown raised this spring a dandelion which measured 6 feet in circumference and weighed 4 lbs. 3 oz. The whole mass of foliage sprang from a single root, and had been only twenty days in growing! It was exhibited at No. 27, North Market street, to a great many admiring spectators, and we were among the number. The leaves were small and tender, but innumerable, and matted together like the fibres of wool in a carpet. The dandelion is not only a palatable pot herb, but may be blanched like celery and make an excellent salad, and is esteemed very wholesome, if eaten in any way.

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF VEGETABLES, FRUITS AND FLOWERS.

Saturday, May 17, 1834.

The following Letter was received and read.

Lansingburgh, 18th April, 1834.

DEAR SIR—I send to your care for an experiment by your society's gardener at Mount Auburn, a newly discovered vegetable, called the *Oxalis Crenata*, a rival to the potato, which has lately been imported from Chili, and cultivated with great success in Suffolk (England.) The flavor of the root is said to be decidedly superior to that of the common potato, and it is equally prolific.

I remain, very respectfully yours,

ALEXANDER WALSH.

Hon. H. A. S. Dearborn, }
Pres. Mass. Hort. Soc. }

Likewise the following letter was received, together with the fruit referred to.

To the Chairman of the Committee of Fruits:

The accompanying two Apples are from the garden attached to the Mansion House of the late Governor Langdon of Portsmouth, N. H. The estate is now owned and occupied by Joseph Wilson, Esq. who sent me the fruit: he calls it the Governor apple. I think it would be called a good

fruit at any season of the year; but at the present time when almost all other kinds are gone, it will be allowed by all to be very valuable. If this variety of apple proves to be rare, and any members of the society should wish for scions at the proper season, I have no doubt that Mr. Wilson would give them with pleasure.

Yours respectfully, JOHN C. LEE.

Salem, May 17, 1834.

Flat Pippins from Maryland, received from John Prince, Esq. of Jamaica Plains.

Scions of various kinds of Plums from R. Manning.

A fine specimen of Asparagus from Samuel Pond.

For the Committee on Fruits,

CHS. M. HOVEY.

The asparagus was presented to us, The Editor, by Mr. Pond. The shoots were many of them an inch in diameter, and all as large and as fair as any we ever beheld in the best of seasons. Mr. Pond deserves and will please to accept our best acknowledgments.

Thomas Mason, Charlestown Vineyard, splendid variety of Anemonies and Tulips.

By order of the Committee,

JONA. WINSHIP, Chairman.

ITEMS OF INTELLIGENCE.

Terrible Hurricane. The Petersburg (Va.) Intelligencer, of the 8th inst. gives an account of a dreadful tornado which passed near that place on Monday the 6th inst. It varied in width from two hundred yards to half a mile, and its ravages extended at least seventy miles. Every thing within its range was laid prostrate, including dwelling-houses, out-houses, trees, fences, &c. A considerable number of lives were lost by the blowing down of buildings, and property to a very large amount has consequently been destroyed. On several plantations the buildings were blown entirely from their foundations, and their contents carried to a great distance.

The Weather, has been uncommonly cold as indicated by some paragraphs below. A letter from the Postmaster at Greenwich, Mass. to the Editor of the Boston Transcript, informs that on the 6th inst. the thermometer stood at 26½ degrees.

We understand that snow fell in the western part of this County to the depth of a foot on Sunday night. We have seen several persons who declare it was "over shoes" when they left home.—*Greenfield Mercury*.

A brilliant meteor was seen last night in the southern part of the heavens about eight o'clock, at a greater altitude than is usual with such phenomena. It rose gradually, and emitted a pale flame not unlike that of an artificial blue light, and its shape was rather that of an armorial lozenge, or a diamond, than round: it was visible for several seconds, and then disappeared when nearly at its greatest elevation.—*Quebec Mercury*.

There are now nineteen steamboats plying to and from this harbor, viz. Great Britain, St. George, United Kingdom, William IV, Cobourg, Sir James Kempt, Britannia, Kingston, Rideau, Thomas McKay, Toronto, Margaret and Enterprise—British boats: and United States, Oswego, William Avery, Carrol, Black Hawk and Caroline—American boats. For purposes of pleasure or commerce, a person may scarcely want an opportunity of employing a steamboat at any hour of the day.—*Kingston Chronicle*.

Ice, eighth of an inch thick, formed last night (May 13) in this neighborhood.—*Newburyport Herald*.

The Season. Fears are entertained that fruit trees will be seriously injured by the late frosts. We have had March weather for the last six days—on Wednesday night snow fell, which at sunrise had the appearance of a heavy hoar frost.—*Concord N.H. Galaxy* of 17th inst.

The Journal of Commerce speaks of new potatoes weighing three ounces each, and icicles eight inches long at ten o'clock in the morning.—*Transcript*.

A novel agricultural feat was performed in Rhode Island, a few days since. It was a ploughing match on a trial of skill in the use of the plough, among fifteen competitors. The projectors engaged fifteen ploughs with teams, to plough fifteen acres of green sward, paying each a fair compensation, and offering a premium for the best performance, according to certain specified rules. A Committee was appointed to superintend the performance, and examine the work. The trial employed sixty head of cattle, and was completed in from six to eight hours. It must have been a pleasant and exhilarating spectacle. Of such sports we have too few in this country.

Curious Phenomenon. The Montreal Herald of the 28th ult. states that—

On Saturday morning, a very singular phenomenon was observable from the river bank in front of our city. Those who were blessed with a very strong sight perceived as they supposed, an immense number of small birds in the air, but at such a height as to render even birds in that situation a curiosity. We happened to be passing and in vain strained our eyes to discover the objects which others were contemplating with so much eagerness—by the help of a glass, however, we at last perceived what was to all appearance an immense flock of small birds. These objects passed away in millions before the light wind then blowing, but many descended lower than the rest, until easily discernible by the naked eye. At length they approached the earth, and proved to be maple leaves of an unusually large size. Many of them were picked up by the citizens, and we have kept one. Whence they came, or how they got there are questions which furnish a wide field for conjecture. One shrewd fellow observed "that this must be the fall of the year in the moon, and that they certainly came from thence."

▲ *Generous Act.* The Hon Mr. GRENELL of Massachusetts, in crossing the bridge over the basin, near the Centre Market House on Sunday last, learned from some boys that a negro lad had fallen into the basin, and sunk, some minutes before. Finding any other means of recovering the body hopeless, he threw off his coat and plunged into the water, (about 8 feet deep) and after going down once or twice ineffectually, at last found the body, and conveyed it to the wharf, to all appearances dead. After a short time however, he had the happiness to perceive that his efforts, and the risk he incurred, had not been in vain. The lad gradually recovered.—*Nat. Intelligencer*.

BOX PLANTS.

From Seven Hundred to One Thousand Yards of Prime BOX in good order for Planting. To be taken up at any time when ordered. Orders may be left with GEO. C. BARRETT, New England Farmer Office, or apply to THOMAS MASON, Charlestown Vineyard. It may be had on fair terms by the Yard or Hundred. m 7

ZINC WARE.

Just received, a further supply of Zinc Milk Pans, Kettles and deep Bake Pans, and for sale at the Agricultural Warehouse, No. 51 and 52 North Market Street.

The manufacturers of this article having closed their works, no more of them can be procured at present, and as the season is at hand when these are most wanted, and as they are found on trial to produce a great increase of Milk, they are highly recommended to the public as one of the improvements of the day. my 14

WILLIS'S IMPROVED STRAW AND HAY CUTTER.

For sale at the Agricultural Warehouse 51 and 52 North Market street. The straw or hay cutter is a machine well worth the attention of every farmer, and should be in common use with every farmer feeding stock.

From the great improvement and simplicity of these machines of Willis's, the work is done with great ease and despatch, and requires but one person to operate it, which is not the case with any other machine, every farmer who is disposed to use his fodder to the best advantage and preserve his animals in the best health will in all cases cut their fodder. my 21

VALUABLE NEW WORK ON AGRICULTURE.

This day Published, by GEO. C. BARRETT, at the Office of the N. E. Farmer.—The

COMPLETE FARMER and RURAL ECONOMIST,

By THOS. G. FESSENDEN, Esq.

Containing a compendious epitome of the most important branches of Agriculture and Rural Economy, and the following subjects arranged in order:

| | | | |
|--------------|---------|----------------|-----------------|
| Soils, | Wheat, | Beans, | Mangel Wurtzel, |
| Grasses, | Rye, | Swine, | Ruta Baga, |
| Grain, | Oats, | Lime & Gypsum, | Potatoes, |
| Neat Cattle, | Barley, | Fences, | Haymaking, |
| Barns, | Millet, | Hedges, | Ploughing, |
| Dairy, | Hops, | Sheep, | Poultry, |
| Hemp, | Peas, | Horses, | Wood: |
| Flax, | | | |

and to which is added—Descriptions of the most approved Implements and Machines, with Engravings.

The work is printed on the best of paper, and is intended for a Farmer's Directory, which every farmer should be possessed of; and relying upon an extensive sale will be afforded at the low price of \$1. m 21

FULL BLOOD SHORT HORN HEIFER CALVES FOR SALE.

Four full blood Short Horn Calves for sale from Imported Stock, sire and dams, if application is made in one week to the Publisher of the New England Farmer, he will furnish particulars as to prices, ages, &c. may 14

WILLIAM PRINCE & SONS, FLUSHING,

—Offer the following rare DAHLIAS, which will be delivered in pots if desired, and 25 per cent. discount allowed where a dozen or more are taken.—Levick's Incomparable, scarlet petals tipped with white, \$2. Prince George of Cumberland, dark superb, \$2. Hanoverian Striped, purple and white, \$2. Lady Selton, spotted lilac, \$1.50. Marshall's, pale lilac with purple spots, \$2. Queen of Belgium, white tipped with purple and very large, \$2. Agrippina, beautiful variegated, \$2. Duchess of Kent, striped, \$1.50. Highlander, striped with orange, \$1.50. BRIGHTON MARKET.—MONDAY, May 19th, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 216 Beef Cattle, (unsold 12) 12 pairs working Oxen, 15 cows and calves, and 250 sheep.

Prices. Beef Cattle—More than half the beef cattle were bought before they arrived at the market; a large proportion were purchased by the "lump," but at an advance price from last week. We shall quote prices from the best information we can obtain, say one yoke extraordinary fine at 6 88, and one at 6 75; also one yoke, fed by Mr. Sheldon, of Deerfield, sold for \$195; prime at 6 50 a 6 62; good at 6 12 a 6 50; thin at 5 50 a 6.

Working Oxen—No sales noticed.

Cows and Calves—We noticed sales at 20, 22, 23, 24, 26 1/2, 28, and 30.

Sheep—One lot sheared were taken at 2 75, 3 and 3 50; those not sheared at about 4 50 each.

Pigs—None at Market.

HALL'S IMPROVED HAY RAKES.

Just received, and for sale at the Agricultural Warehouse, 50 dozen of the first and second quality of Hall's best warranted Hay Rakes. my 14

MISCELLANY.

From Blackwood's Magazine.

SPRING.

BY THE HONORABLE MRS. NORTON.

THE Spring is come again! the breath of May
Creeps whisperingly where brightest flowers have birth,
And the young sun beams forth with redder ray
On the broad bosom of the teeming earth.

The Spring is come! how gladly Nature wakes
From the dark slumber of the vanished year;
How gladly every gushing streamlet breaks
The summer stillness with its music clear!

But thou art old, my heart! the breath of Spring
No longer swells thee with a rapturous glow,
The wild bird carols blithely on the wing,
But wakes no smile upon my withered brow,

Thou art grown old! no more the generous thought
Sends the warm blood more swiftly through the veins—
Selfish and cold thou shrinkest—Spring has nought
For thee but memory of vanished pains.

The day-break brings no bounding for my rest,
Eagerly glad, and strong in soul and limb:
But the weary lid, (unwelcome guest!)
The sunlight struggles with a lustre dim.

The evening brings no calm—the night no sleep,
But feverish tossings on the hateful bed,
While the vexed thoughts their anxious vigils keep,
Yet more to weary out the aching head.

Still the deep grove—the bower—my footsteps seek,
Still do I read beneath the flowery thorn;
And with a worn and hollow eaten cheek,
Woo the young freshness of the laughing morn.

But now no pleasure in the well known lines,
Expands my brow, or sparkles in mine eye,
O'er the dull page my languid beau declines,
And wakes the echo with a listless sigh.

Ah! mocking wind that wandereth o'er my form,
With freshened scents from every opening flower;
Deep—deep within, the never dying worm—
Life's longings all unquenched defy thy power!

There coolness comes not with the cooling breeze—
There music flows not with the gushing rill—
There shadows calm not from the spreading trees—
Unslaked the eternal fever burneth still!

Mock us not, Nature, with thy symbol vain
Of hope succeeding hope through endless years—
Earth's buds may burst—earth's groves be green again,
But man—can man forget youth's bitter tears?
I thirst—I thirst! but duller day by day
Grow the clogged soarings of my spirit's wing:
Faintly the sap of life slow ebbs away,
And the worn heart denies a second spring.

MEDICINAL PROPERTIES OF SALT.

DR. STEVENS, an eminent physician of London, has recently made certain discoveries relating to the diseased and healthy state of the blood, and the agency of salt upon the circulation, which seem likely to produce a great revolution in the treatment of fevers, and malignant diseases in general.

It is well known that the blood of the arteries is of a bright crimson color, while that of the veins which is returning to the heart, after having spent its vivifying influence, is of a dark purple. According to Dr. Stevens, the bright red color, the vitality and the stimulating power of the arterial blood are all dependant on the quantity of salt which enters into its composition; while all the acids and alkalies, and in general all poisons, tend to blacken the blood, to reduce its stimulating powers, and of

course to diminish the force of its circulation. The purple color of the venous blood is owing to the carbonic acid it has imbibed. In the lungs, the oxygen of the atmosphere removes this deleterious acid, and the circulating fluid then resumes its bright scarlet appearance.

According to this theory, poisons, and those malignant disorders, such as the marsh fever, yellow fever, &c. which originate from the patient having imbibed febrile poison, are, in their very first stages, accompanied with a blackness and stagnation of the blood, occasioned by the destruction of its saline principle—and to cure the patient this saline principle must be restored.

Take for instance the bite of a rattlesnake. In this case the poison of the serpent's fangs mingles with the circulation, destroys its red color, and its vitality, brings on blackness of the blood, stagnation of its current, convulsions, and death. The unfailing antidote, which experience has taught the Indian to apply, is to scarify the wound to the bottom, and to fill it with salt. This salt is taken into the circulation, restores the redness and vitality of the blood, and the wound soon heals. Malignant fevers, and other malignant disorders, operate in the same way. They begin by destroying the color and vitality of the blood, and reducing it to a black and putrid mass; and says Dr. Stevens, "I have seen patients in the last stages of these disorders recover under the internal use of large doses of common salt and other saline agents, where the cases at first were so hopeless, that their recovery afterwards appeared to be almost a miracle."

The climate fevers of the southern regions and some other fevers, are produced in a different way; a cold climate requires a different constitution from a warm one. In the cold climate, the digestive organs are more vigorous, and the blood is rich, stimulating, and full of salts. The blood in southern climates is of less brilliant color, thinner and less impregnated with saline substances. When the constitution of a northern stranger is suddenly exposed to the influence of a southern climate, nature hastens to produce the necessary change in his circulation, and this change is generally accompanied with an awful disease. While the skin performs its functions of perspiration, there is no danger; but the moment perspiration becomes obstructed from imprudent exposure to the cold night air, or any other reason the fever breaks out. The cause is, that the blood is too stimulating, too full of salts! and the danger is, lest this operation of nature, for reducing it should be carried too far, and the blood so much blackened and weakened, that the patient dies of mere exhaustion. These disorders therefore according to Dr. Stevens, in their first stages require the acid, and in their last stages the saline treatment.

If this theory of Dr. Stevens be true, a great step has been made in the treatment of febrile and malignant disorders; and certainly the universal use of salt as an indispensable article of diet as far back as history carries us, and the craving which even animals both wild and tame, exhibit for it, would tend to prove that this condiment has some universal and essential effect on the bodily constitution.

SAVINGS BANKS

—Were first established by law in England, about the year 1812, on the suggestion of Mr. Bentham, and the influence of Mr. Rose. The plan proposed by the former, was however, but partly adopted. It is stated in a London paper, that the sums now deposited in the Savings Banks throughout Great Britain and Ireland, amount to sixteen millions of pounds sterling; and the number of those institutions is said to be five hundred.

Howard's Improved Patent Cast Iron Plough.

FOR SALE at the Agricultural Warehouse 51 & 52 North Market street, a further supply of Howard's Improved Patent Cast Iron Ploughs. The very extensive sale these ploughs met with the past season, and the very general satisfaction they gave to all persons who used them, give them decidedly the preference over all ploughs now in use—a constant supply of them will now be kept for the accommodation of the public, and all orders will be supplied on the same terms as at the manufactory. a 16

For Sale at the Agricultural Warehouse,

—HARDEN'S improved SEED SOWING MACHINE. This is one of the best labor saving machines in use, calculated for sowing small seed. The saving of seed in the use of this implement is more than sufficient to pay the cost of it annually. Price \$5. ap 16

PRIZE DAHLIAS.

FOR SALE, 200 varieties of the best double Dahlias. This collection of Dahlias obtained the premium awarded by the Mass. Hort. Society the two last years.

Orders left with Messrs. HOVEY & CO. No. 79 & 81 Cornhill, Boston, or C. F. PUTNAM, Salem, will be duly attended to. apr 2

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

1 Case wet (but not damaged) Bishops Lawn.
1 do. do. do. Book Muslin.
Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation. m 14

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table mats. istf. a 16.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[P] No paper will be sent to a distance without payment being made in advance.

AGENTS.

VOL. XII.

BOSTON, WEDNESDAY EVENING, MAY 28, 1834.

NO. 46.

From Goodsell's Farmer.

EXPLANATION OF AGRICULTURAL TERMS.

1. *Broad-Cast Husbandry*—is that in which the grain or seed is sown by a cast of the hand, so as to be strewed equally as possible over the whole ground.

2. *Drill Husbandry*—is that in which the grain or seed is sown in rows, by means of machines contrived for that purpose, and the ground afterwards kept stirred and cleared of weeds by a kind of plough called the horse-hoe, hence sometimes called the *horse-hoeing husbandry*.

3. *Convertible Husbandry*—is when the ground is cultivated alternately in tillage and grass. This is much practised in some parts of the country, with wheat and clover. A field in clover soon after haying, is turned up and sowed with wheat and clover seed. After the wheat is taken off it is once mowed, when it is again ploughed up and sowed as before; thus the ground carries the wheat every other year, and the intermediate years, clover. The term applies also to a succession of any kind of crops in which grass is comprehended as one.

4. *Trench Ploughing*—is running the plough twice in the same furrow. In doing this the top soil, with all its foul weeds, cast to the bottom of the trench, a new soil is thrown up on which the sun has never before shed its rays. It is done sometimes at one operation, by a plough constructed for the purpose, called a trench plough.

5. *Horizontal Ploughing*—is so conducted by the use of an instrument, called "ratter level," as to lay the side hills in horizontal beds, about six feet wide, with deep hollows or water furrows between, for the purpose of retaining the rains.

6. *Indigenous Plants*—are such as are natives of the country in which they are found or grow.—Thus, maize, the potato, and tobacco, are called indigenous to America, having been found here, and from America introduced into Europe.

7. *Exotic Plants*—are such as are natives of foreign countries. Such as the lemon tree, and many others, when introduced into the New England states, are cultivated in hot houses.

8. *Annual Plants*—are such as are of but one year's duration. Such are the most of our garden plants, and all others growing from seed sown in the spring, which are at maturity in the summer or autumn following, producing flowers and ripe seed, and afterwards perish both in their top and roots.

9. *Biennial Plants*—are such as, in their roots at least, are of two years' duration. Many of these plants perish in their top the first year, but live in the root through the winter, and the second year shoot up stalks, flower, produce seed, and afterwards perish both in root and branch. Such are the parsnip, carrot, &c.

10. *Perennial Plants*—are such as are of many years' duration. Such are all plants whether the leaves and stalks perish annually or not, provided the roots are of many years' duration, as the horse radish, burdock, &c.

11. *Herbaceous Plants*—are those whose herb, that is, whose stem and branches are of but one year's duration whether the root be annual, biennial, or perennial.

12. *Esculent Plants*—are such as are replete with nutritious matter, consequently proper for being eaten as food. Such are parsnips, carrots, cabbage, and various others of a similar nature.

13. *Umbelliferous Plants*—are all such as produce their flowers on the end of numerous little flower stocks, or rays, nearly equal in length, spreading from a common point or centre, forming a level, usually convex or globose surface, somewhat like a spread umbrella, as the parsnip, carrot, &c.

14. *Leguminous Plants*—are those of the pulse kind, which producing their seeds in pods, may be gathered by the hand, as peas, beans, &c.

15. *Culmiferous Plants*—are all such as have smooth pointed stems, and whose seeds are inclosed in chaffy husks or coverings. All the grains and most of the grasses, as well as many other plants are of this kind.

16. *Deciduous Plants*—are all such plants whether of the tree or shrub kind, as shed or lose their leaves in the autumn or winter seasons.

17. *Tuberous Plants*—are such as consist of one or more knobbed tubes of a solid fleshy substance, as the potato, artichoke, &c.

18. *Bulbous Roots*—are such as have a roundish, swelling, bulbous form, composed of numerous scales or coats, as the onion, garlic, &c.

19. *Tap Roots*—are such as in the form of a tap descend down into the ground in a perpendicular direction, as the carrot, parsnip, red clover, &c.

20. *Fibrous Roots*—are such as are wholly composed of numerous thready or fibrous parts, such as the roots of all kinds of grain.

21. *Fadicles or Radicles*—in botany, are in the small fibrous roots, which extend themselves in every direction in the earth for the purpose of collecting nourishment for the support of the plant.

22. *White Crops*—are such as become bleached, and dry while ripening their seed; such are all the various kinds of grain.

23. *Green Crops*—All plants while their leaves continue green, and especially such as having large leaves, draw much of their nourishment from the atmosphere. The *Green Crops* therefore exhaust the soil much less than the *white crops*, whose leaves becoming dry, receive nothing from the atmosphere, but draw all their support from the soil while ripening their seed.

24. *Rotation of Crops*—is a course of different crops, in succession on the same piece of ground, for a certain number of years, after which the course is renewed and goes around again in the same order. There is a difference between a *course of crops* and a *rotation of crops*. Thus, if a piece of ground in sward be broken up and planted with Indian corn the first year, the second year with potatoes, the third year sowed with oats and grass seed: and mowed the fourth, fifth and sixth years, this makes a course in crops. If then the seventh year it again be broken up, planted as before, and the same course of cropping pursued, it becomes a *rotation of crops*.

25. *Soiling*—is the feeding of cattle, either in the barn or yard, through the summer, with new mown grass or roots.

26. *Live Hedge*—is a fence formed of living plants, usually the white thorn, planted closely in

rows, which being trimmed annually, and kept clear of weeds, in a few years grow into a living permanent fence, capable of stopping effectually every kind of domestic animals. Most of the common farm fences in England are of this kind.

27. *Quicks*—a name commonly given to the young plants of the white thorn used in planting hedges.

28. *Layers*—are the tender branches of trees and shrubs bent down and buried in the earth, leaving the top out, in which situation they are fastened with hooks to prevent their rising. The part in the earth sends out roots, after which it is separated from the parent tree, and transplanted in the same manner as the trees raised from the seed.

29. *Cuttings or Skips*—are small portions of the twigs, branches or roots of plants, cut off with a knife, or slipped off with the thumb and finger, for the purpose of setting or planting in the earth; with a view of producing new plants or trees of the same kind.

30. *Sets*—are young plants taken from the seed bed to be set or planted out. Cabbage, and various plants are usually propagated in this way, being first sown in beds, from which the plants are taken up and set out in the fields or gardens.

31. *Fallow*—signifies land in a state of rest, not being planted or sown for a season, but repeatedly ploughed and harrowed, for the purpose of clearing it of weeds and dividing and pulverizing the soil more perfectly. Such is sometimes called a *plowed fallow*, because the land carries no crop.

32. *A Green fallow*—is that where the land has been rendered mellow and clean from weeds, by means of some kind of *green crops*, such as turnips, peas, potatoes, &c. cultivated by the horse plough and hoe. The crop so cultivated and for the above purpose, is called a fallow crop. In this mode of fallowing, no time is lost by the land being left idle or in an unproductive state. Fallowing is sometimes distinguished by the season of the year in which the business is either principally or wholly accomplished; hence we have summer, winter and spring fallow.

33. *Winter fallow*—is only breaking up the land, or ploughing in the fall, and leaving it exposed to the action of the frosts of the winter.

34. *Dibble*—is a tool of very simple construction, for making holes in the ground at equal distances, in which certain seeds are sometimes planted. Seeds planted in this way are said to be dibbled in. It is used also in transplanting. The handle of an old spade or shovel, sharpened at the lower end, may answer very well for this purpose.

SPLENDID CAULIFLOWER.

At a meeting of the committee of management of the Maryland Horticultural Society, on Thursday the 8th inst., a cauliflower was exhibited by Mr. Thomas Dixon, gardener to Mrs. Donnell of Willenbrook, which measured two feet eleven inches in circumference. It was remarkably compact and firm, and in the highest degree of perfection. It was considered by all the members the finest ever exhibited in Baltimore, and several gentlemen who had been familiar with this delicious vegetable in Europe, said it would have been considered a first rate one.—*American Farmer*.

**CATTLE SHOW,
AND AGRICULTURAL EXHIBITION FOR THE
COUNTY OF BRISTOL,
Wednesday, Oct. 1, 1834, at East Attleboro'.**

THE Bristol County Agricultural Society, having been encouraged by the success of their efforts heretofore made for the promotion of Agriculture and Manufactures in the County of Bristol, and by the patronage of the government of the Commonwealth, do now offer the following Premiums:—

FOR STOCK.

| | | | |
|--|---|---|-----|
| For the best fat Ox, | - | - | \$8 |
| For the second best do. | - | - | 6 |
| For the third best do. | - | - | 4 |
| For the best fat Cow, | - | - | 3 |
| For the second best do. | - | - | 2 |
| For the best Heifer or Steer, not less than 2 nor more than 3 years old, | - | - | 3 |
| For the second best do. do. | - | - | 2 |
| For the best Bull, not less than one year old, having reference to size, form and disposition, | - | - | 8 |
| For the second best do. do. | - | - | 5 |
| For the third best do. do. | - | - | 3 |
| For the best Bull Calf not less than 4 nor more than 12 months old, having reference to the same properties mentioned in the bull, | - | - | 3 |
| For the second best, do. as above, | - | - | 2 |
| For the five best milch cows, all owned by one person, having regard not only to their qualities for the dairy, but all other essential qualities in cattle, | - | - | 8 |
| For the best milch cow, | - | - | 6 |
| For the second best, do. do. | - | - | 3 |
| For the best heifer not less than one nor more than three years old, and not having had a calf, | - | - | 4 |
| For the second best, do. do. | - | - | 3 |
| For the third best do. do. | - | - | 2 |
| For the best Merino or Saxon Buck, full blooded or mixed, regarding as well the quantity and quality of the wool, as the form and size of the animal for mutton, | - | - | 3 |
| For the best Ram of imported breed, except Merino and Saxon, | - | - | 3 |
| For the six best Merino or Saxon ewes, | - | - | 3 |
| For the six best of any other breed, | - | - | 3 |
| For the best Boar, | - | - | 3 |
| For the second best, do. | - | - | 2 |
| For the best breeding Sow, | - | - | 3 |
| For the second best, do. | - | - | 2 |

A disposition to early maturity in any of the animals, (particularly swine) will be a strong recommendation.

Persons exhibiting *Breeding Stock*, are required to state the Breed and Pedigree of the animals as well as an accurate account of the mode in which they have been fed; and such stock shall be kept within the County six months at least after any premium may have been awarded upon it, and in consequence of the non-observance of this last requisition, in many instances, persons to whom premiums are awarded for Breeding Stock shall not receive a premium until the expiration of six months from the day of exhibition, and not then unless they exhibit satisfactory evidence to the Treasurer that the animal or animals for which the premiums were awarded, were alive, and within this County.

Any of the stock having been raised in the County and being still owned by the person who raised the same at the time of the exhibition, will entitle the claimant to an allowance of ten per cent. in addition.

Fatted cattle to be entitled to premium must have been owned in the County at least three months immediately previous to the exhibition. And premium on Sheep will not be granted unless they shall have been owned in the County aforesaid, or unless they shall have been imported from some foreign country.

WHITE MULBERRY TREES AND SILK.

To the person who shall have in the course of cultivation, on his own farm, (not less than 100 trees,) for the purpose of making silk, being in the most thrifty condition and greatest number, and who shall furnish an affidavit of their number, age and size to the Secretary of the Society, on or before the first day of September next,

| | | | |
|---|---|---|----|
| To the second class, and under the above conditions, | - | - | 12 |
| To the third, do. do. do. | - | - | 10 |
| To the fourth do. do. do. | - | - | 8 |
| For the best raw Silk or sewing Silk produced from the White Mulberry Trees, not less than four pounds, | - | - | 6 |
| For the second best, do. do. | - | - | 4 |
| For the third best, do. do. | - | - | 3 |
| For the second best, do. do. | - | - | 2 |

A proportionably increased premium will be given for a greater quantity of Silk, not exceeding ten dollars.

GRAIN AND VEGETABLE CROPS.

| | | | |
|--|---|---|----|
| For the best crop of Indian corn raised on an acre, being not less than 60 bushels, | - | - | 10 |
| For the second best, averaging not less than 50 bushels the acre, on not less than two acres, | - | - | 7 |
| For the second best averaging not less than 40 bushels, from not less than four acres, | - | - | 8 |
| For the best crop of potatoes, from not less than one acre, | - | - | 7 |
| For the second best, do. do. | - | - | 6 |
| For the best crop of Wheat, being not less than five bushels from a quarter of an acre, | - | - | 4 |
| For the second, do. do. | - | - | 3 |
| For the best crop of Rye, not less than 15 bushels on one acre, | - | - | 6 |
| For the second best, from not less than 2 acres nor less than 12 bushels to the acre, | - | - | 5 |
| For the best crop of Barley on one acre, not less than 30 bushels, | - | - | 4 |
| For the best crop of Oats, do. do. | - | - | 4 |
| For the best crop of Hay produced on an acre, consisting principally of Herd's Grass, Fine Top and Red Top, | - | - | 6 |
| For the second best, do. do. | - | - | 4 |
| To any person who shall introduce any Grass not before cultivated in this county, and prove after actual experiment, its superiority to any grass now cultivated | - | - | 10 |
| For the best crop of Ruta Baga, Carrots, Mangelwurtzel and Onions, each from not less than a quarter of an acre, | - | - | 5 |
| For the second best, | - | - | 4 |
| For the best crop of English Turnips from not less than half an acre, | - | - | 3 |

Any claimant for either of the above premiums, must state in writing signed by himself and some disinterested person, accompanied by the certificate of some Surveyor, of the admeasurement of the land on which the crop was produced, the following particulars, viz: The state and quality of the land in the Spring of the year 1834; the product, and general state of cultivation, the quantity of manure put upon the land the preceding year; the quantity of manure used the present year; the

quantity of seed, and if potatoes the kind; the time and manner of sowing, weeding, and harvesting the crop; the amount of the product, ascertained by actual admeasurement after the whole produce is harvested; and the entire expense of cultivation. Of Indian corn, the entire crop if shelled, must be measured between the 15th of November and the first day of December; if not shelled, the whole must be weighed within the same time, and 75 lbs. will be considered equal to one bushel of shelled corn.

The claims of premiums under this head, together with the evidence of the actual product, must be delivered free of expense, to Sidney Williams, Esq. of Taunton, Recording Secretary, on or before, the first Wednesday of March next, as the Committee will not decide between the claimants until their meeting in this month.

BUTTER, CHEESE AND HONEY.

| | | | |
|--|---|---|-----|
| For the best tub of butter, not less than 50 lbs. the produce of the farm of the claimant, with a written statement of the time when and how manufactured, | - | - | \$8 |
| For the second best, do. do. | - | - | 6 |
| For the third best, do. do. | - | - | 4 |
| For the best lot of cheese, not less than 100 lbs. do. do. do. | - | - | 8 |
| For the second best, do. do. | - | - | 6 |
| For the third best, do. do. | - | - | 4 |

To the person who shall take up in the season, on his own farm, the greatest quantity of good Honey, and shall at the same time, exhibit the greatest skill in the management of Bees,

| | | | |
|---------------------|---|---|---|
| Second premium, do. | - | - | 2 |
|---------------------|---|---|---|

| For the best narrow Axes, do. | - | - | 2 |

PLOUGHING MATCH AND TRIAL OF WORKING OXEN.

On the morning of the day of Exhibition at 9 o'clock, the ploughing Match will commence, and premiums will thereafter be awarded to the owners of the ploughs which shall plough in the best manner, and with the least expense of labor one eighth of an acre within a limited time, under the direction of the Ploughing Match, viz:

| | |
|--|-----|
| To the 1st Plough, with one yoke of Oxen, without a Driver, - - - | \$7 |
| To the 2d, do. do. do. - - - | 6 |
| To the 3d, do. do. do. - - - | 5 |
| To the 4th, do. do. do. - - - | 4 |
| To the 5th, do. do. do. - - - | 3 |
| To the 1st Plough with two yokes of Steers not more than 4 years old, or one yoke with horse without a driver, - - - | 5 |
| To the 2d, do. do. do. - - - | 4 |
| For the best Plough used at the Ploughing Match, not having heretofore drawn a premium, - - - | 2 |
| For the second best, do. do. - - - | 1 |
| For the best yoke of working Oxen, which have been owned in the County not less than three months, - - - | 5 |
| For the 2d, do. do. - - - | 4 |
| For the 3d, do. do. - - - | 3 |
| For the 4th, do. do. - - - | 2 |
| For the 5th, do. do. - - - | 1 |
| For the best yoke of three years old Steers, regard being had to their qualities, both for labor and for beef, - - - | 4 |
| For the second, do. do. - - - | 3 |
| For the third, do. do. - - - | 2 |

Premiums for excellence in Steers and working Oxen will be awarded by such mode of proof as the Committee shall deem expedient on the day of exhibition.

Those who shall present specimens of Apples or of other Fruit, or of Cider to be used at the table of the Society, will receive its thanks and some special marks of recognition.

Any person who may be detected in using any unfair or fraudulent means to obtain the premiums of the Society, shall not only forfeit such premium as may have been awarded him, but shall moreover be incapable of ever after becoming a competitor for any of the Society's premiums.

All articles exhibited for premium (except Manufactures and articles which come under the inspection of the Committee on Manufactures) must be entered on or before eight o'clock of the day of exhibition, by a letter to the Recording Secretary, or by personal application to him. No person shall be considered as a competitor who shall not have given notice of presenting an article, or have made application as above to the Secretary.

The Society will not hold themselves responsible for any article exhibited and left in their custody, after 6 o'clock, P. M. of the day of Exhibition.

All manufactures offered for premium must have been made in the county of Bristol, and when presented must have a private mark, so as not to be known by the Committee; and no owner of such article shall be present at the examination.

The respective Committees will consider themselves authorized to refuse a premium in any case, when no competitor appears. And no person shall be entitled to a premium for any article for which a premium has heretofore been awarded by this Society.

All animals offered for premium must be owned in the county of Bristol, and accompanied with satisfactory certificates of their age, and other facts which might not be apparent without the aid of such certificates; and if fatted cattle, with a statement of the manner in which they were fatted; whether on Corn, Carrots, Pumpkins or other materials, and the quantity of food administered, with an estimate of the cost of such food.

The Exhibition will be in East Attleborough, and suitable accommodations will be provided for articles of every kind which may be offered for exhibition or premium, of which early notice will be given in the newspapers.

The past success of the Society added to the increasing attention to improvements in Agriculture throughout the country, induce the belief, and the Committee confidently express the hope, that the next Exhibition will be an occasion of satisfaction and pride to the Association, and of benefit and honor to the County.

Should any person offer an article (Animals excepted) for a premium, knowing that a premium had been heretofore awarded for it, in this county, he shall forfeit such premium as may be awarded and be disqualified to be a competitor for any of the Society's premiums.

N. B. It is desirable that affidavits should be furnished with all articles easily susceptible of such proof.

JAMES L. HODGES, } Committee of
HORATIO PRATT, } Publication.

From the Genesee Farmer.

POSTS RENDERED DURABLE BY SALT.

SOME weeks ago we alluded to the preservative properties of this mineral as exemplified in the increased durability of old timbers about salt houses; and mentioned that some had proposed to deposit it in auger-holes to be bored into fence posts. We were not aware at the time that the experiment had been ever tried. It appears however, from the *Memoirs of the Pennsylvania Agricultural Society*, which we have lately obtained, that it was attempted many years ago in that State with the most signal success. What follows is taken from a letter written in 1824, and addressed to the corresponding secretary of that Institution, by William Phillips of Philadelphia county:

"I will give you the result of twenty years' practice, and the mode which has fully realized my most sanguine expectations. In 1803 I planted four gate posts of Delaware oak, of very inferior quality; a two inch auger hole was bored through them, which was filled with salt, and plugged at both ends. As they were to support highly finished gates, they were eased with boards, and some salt was put inside of the case near to the ground. The posts are now as sound as when put down, and bid fair to last for some generations to come. This experiment was tried under the most unfavorable circumstances, as the posts were so much worm-eaten that my carpenters were averse to finish them, under the belief that they would not last five years.

"I have since applied salt to the posts of rail fences, by boring an inch auger hole, about four inches above the ground, diagonally across the post, so as to reach about two or three inches under ground; the hole is filled with salt and closed with cedar or chesnut plugs. With the result I am well satisfied, as I have not found any decay among them, although I have several thousands so prepared. It has been observed by some who have seen them, that the salt would in time dissolve, and by leaving a hollow in the post to retain the moisture, cause its decay. I have not found that the salt diminishes to any extent; and if it should, it must penetrate the wood, and thereby prevent decay. But to obviate such apprehensions, nothing is easier than to draw the plugs, and fill the holes again with salt at the expiration of eight or ten years, or when required, which

would be at a very distant period. This can be done at less than a cent a post, exclusive of salt, which must be admitted, is preferable to planting them anew. I have usually paid the workmen a cent a post for boring, filling and plugging; they generally earn two dollars a day. A judicious farmer, on viewing my posts, observed he could see no reason why salt should not preserve wood, when it preserved so perishable a vegetable as cabbage during many years."

The advantage of treating new posts in this manner appears to be very decided; and we discover no reason why posts that have been set several years should not also have the benefit of a dose. We should presume that they may be kept in as sound a state as they are at present. Posts which are already set, will not require to be bored through, if the person performing the operation will carefully gauge the distance; and one plug will then answer in the place of two. This item will save some labor.

ON DESTROYING CATERPILLARS.

"Better late than never."

We remember to have seen some years ago, an ancient work on Husbandry, by Tusser, giving the directions all in rhyme. The work proper to be done in each month, was put under that head; but first and foremost this couplet was repeated:

"Things forgot in month past,
Now do at the last."

The advice was the best the occasion allowed, and we are by no means disposed to consider it obsolete. So we say to such farmers as have not killed all their caterpillars; "Better late than never." These crawlers have done mischief enough—now despatch them. If left they will continue to feed on the leaves almost another month, every day growing bigger; and one big caterpillar can eat as much as five little ones. This work ought to be done before breakfast, while they are snug in their nests. And permit us kindly to suggest to you that early rising has a fine effect on this business. Is four o'clock too early? Then think the matter over till half past four; but beware of taking another nap, and sleeping till after sunrise.

Some people seem to console themselves for their negligence by adopting an old notion that caterpillars come periodically; and indeed they do—but the period is every spring. The man in the fable who sat down on the bank waiting for the river to pass—or the countryman in London who intended to stand still till the crowd had gone by—had notions not more preposterous. We have never seen a year in which caterpillars were not plenty in certain orchards. Without doubt there are more in some seasons than in others;—for we have seen them come from the woods in great numbers; but what of that? If we allow them to go on devouring till they are full grown, and come forth in the perfect state, will they not lay eggs? and will not these produce caterpillars next year. We think they will.—Genesee Farmer.

Hickory ashes, thrown upon swine, not only assists in destroying fleas, but in removing cutaneous diseases, by causing the animals to rub themselves frequently.

*We remember in days long past to have heard old people say that caterpillars were always plenty after the locust year. That notion would not imply that caterpillars are the descendants of the locusts; but only that they also had some pretensions to a period of seventeen years.

From the Edinburgh Quarterly Journal of Agriculture.

ORCHARDS IN CLYDESDALE.

The orchardists in Lanarkshire have relinquished the practice of placing flags under the fruit trees; and they neither make pits, nor trench the ground eighteen inches deep, or more than ordinary delving with spades. They plant the trees only from six to eight inches deep, and raise the earth of a foot or eighteen inches round them, a few inches above their roots, to enable them to withstand the blast.

Young fruit trees require ropes of straw, or sprigs of broom, to be tied round them, to prevent their bark being eaten by hares. Either of these means are preferable to besmearing the trees with soot, or any other nasty substance.

The produce of the Clydesdale orchards, consisting of apples, pears, plums and small fruit, has hitherto been disposed of as fruit for family use, or sold to retailers in Glasgow, Paisley, Hamilton, Lanark, &c.; and part of it has been disposed of in Edinburgh. But now that the price of apples and pears have fallen to less than one third part of what they brought about twenty years ago, and from the great expense of carting fruit to market, the orchardist would do well to consider if it could not be manufactured into cider and perry.

It is well known that apples raised from a clay soil make the best cider; and from the best information I have been able to procure, from twenty-four to thirty bushels of apples yield a hogshhead, or 110 gallons of cider, the price of which varies from £1 5s. to £2 2s. per hogshhead. In Herefordshire, twenty hogshheads of cider have often been made from the apples grown upon an English acre of land although no more than forty trees grow on an acre. If a part of the fruit in Lanarkshire were converted into cider and perry, when the crops are most abundant, and only the marketable part of the crop, or what is known in Glasgow by the name of "shop fruit" were sold, a considerable sum might be raised by these beverages, while the value of the marketable fruit might be kept at a remunerating price. Should the return from perry and cider fall short of the price the fruit brought some time ago in the Glasgow market, the expense of the carriage of the fruit at all events would be saved. I understand that the whole apparatus and utensils for making cider may be fitted up for about £50, and that two or three of these establishments would be sufficient to bruise one-half of the fruit these orchards produce annually.

From the vast quantity of gooseberries and currants now raised in the Clydesdale orchards, and in every garden in that country, their prices have fallen to about one-half, or two-third parts of what they brought some years ago. But as immense quantities of them are now made into jam, jelly, and wine, as well as into tarts and other confectionary articles, condiments so wholesome and palatable cannot fail to be in high request among all ranks of people. These fruits in fact, occupy the same place in Scotland, that the vines do in warmer countries. Apples and pears are eaten in France and Belgium as food along with bread of rye; and in Cornwall and some parts of England, the laboring people eat fruit instead of bread or potatoes, and prefer the fruit to either of them.

Under crops of potatoes, oats, beans, barley, &c. are raised to a considerable extent among the fruit trees in the Lanarkshire orchards, though not in

that regular order as to be traced to any specific rotation of cropping.

The fruit in the orchards in Camnethan Priory, the property of Robert Lockhart, Esq., and which extend to 24 acres, the trees mostly full grown and in good order, was sold a few years ago at upwards of £900; but it was sold another year as low as £30. In general it fetches from £400 to £600 per annum, besides a considerable portion of the best fruit being retained every year for family use.

The orchards at Dalziel House extend now to 18 acres, with 5 acres more recently planted. The fruit on about twelve acres of it was sold one year at £617, and the lowest sum that part ever gave was £100. The small fruit gives from £17 to £36 per annum, besides the value of the valuable under crops.

But a most fatal and common disease in the Clydesdale orchards proceeds from the atmosphere, at the critical period of the blossoms expanding, or the fruit setting. A few days of dry withering easterly wind, or a damp easterly *haar*, or a few flashes of electricity, at the time the trees are in flower, or when the fruit is just beginning to set, often blast the finest prospects of the orchardist. Cold rains sometimes benumb or wash away the pollen; strong winds blow it off, and sudden changes from heat to cold vitiate the fecundating matter, the farina withers in the anthers, and impregnation is prevented. Caterpillars and grubs, of the various species of the phalaena, papilio, and musca, tribes of vermin fix themselves on the buds or leaves of the trees, and destroy not only the fruit, but, like their devouring brethren of Egypt, eat up every green thing, and render the trees, for a season at least barren of fruit.

BIRDS.

"THE flowers appear on the earth; the time of the singing of birds is come."

"See sister see, on yonder bough
The robin sits, I hear it now:
Listen, sister, to the note
From robin red-breast's little throat."

The birds have returned to cheer us with their melody. Who conducted them? who was their pilot through the long journey? How manifest is that power which is above all animal instinct! We see God in all his works. These little warblers, that wing their way through the devils air, have their instinct. It is true, but who gave them that instinct? Is it a matter of chance altogether? O, no; the life of the sparrow alone will refute all infidel schemes. These annual migrations are conducted by a power supreme; the country, the plain, the hill-tops, the accustomed tree, the safe shelter and secure retreat, are all pointed out by the finger of Him, whose care and regard are ever extended to the minutest of his works.

The return of the birds is in the most undeviating order. Those, who left us last, who seemed unwilling to depart from their accustomed haunts and to turn from those whose friendship they were wont to experience, are the first to greet us with their vernal melody. Thus as soon as the spring opens, we hear the blue-bird chirping upon our house-tops, and the song of the robin awakens us from our morning drowsiness. The marsh lark, too, is seen skimming through the air, and the black-bird returns to his favorite meadow lands. The air is soon re-peopled with its multitude of songsters, and the fields and woodlands resound with swelling notes of music. What a signal example to man also to join in the Anthem, and to

make the song of praise universal! Man is the only reasoning creature on earth; yet seems to be the only doubting and thankless creature among the vast millions the Creator has formed.

"Ye savage carles, in mischief rife,
Why rob sweet innocence of life?"

If we recollect aright, we said something on the subject a year ago; we stated the importance of preventing the destruction of the birds, and their use to farmers and gardeners by their destroying millions of troublesome insects.

But on the whole, what signifies preaching or talking, or writing on these subjects? Sad experience may, after a course of years, bring people to an acknowledgement that these little animals were made for some other purpose, than to be sported with and murdered by lazy men and worthless boys; that they are of essential benefit to the agriculturist, and it is to his interest as a cultivator of the soil, and to his credit as a man of true feeling, that they be preserved.—*Old Colony Memorial.*

From the American Farmer.

DOCKING HORSES, ITS IMPOLICY AND CRUELTY.

I HAVE long considered the practice of docking horses highly injudicious; and I now ask the favor of a little space for the insertion of my protest against it. It is, I believe, peculiar to this and the mother country, from which we derive it. In Spain, France and Italy, long tails are universal. The Cossacs, Arabs, and South Americans, who almost live on horseback, never dock their horses.

The tail is to the horse, highly useful and ornamental—nature makes no mistake; nothing superfluous is given to any animal. As a defence against the cold in winter, and flies in summer its use is obvious. A horse that loses the smallest particle of his tail bone never has the free use of it. That he carries it more gaily in consequence of having been docked is a mistake.

As to *nick*ing and *fox*ing, practices of the same origin, still more cruel and absurd, they have gone so much out of fashion, that it is unnecessary to say any thing as to them. Nothing but a vitiated taste could have tolerated mutilations productive of so much deformity. I am happy to acknowledge that the practice of which I complain is gradually subsiding. The tail of a two year old appears to be too large for his body, because one has got its growth, the other not half. When he arrives at maturity this disproportion vanishes—all is symmetry.

But you will be told that carriage horses, particularly gig horses, must be docked, or they will throw their tails over the reins!—that saddle horses must be docked because in wet weather, their tails get muddy!—and that all horses should be docked, to improve their beauty. There is no accounting for taste. To improve his appearance the African files his teeth to resemble a saw; the Indian slashes and distends his ears, whilst the females of more civilized life are content with boring holes through the bottom of their children's ears, thence unto suspending bunches of beads, coral, &c.; the Chinese compress the feet of their females until they are useless; and the South sea Islander of fashion, spends more than half of his life in tattooing his swarthy skin.

Those who breed horses for sale, lose more in this way than they are aware of. Bring to market two colts, as equal in merits as possible, one docked, the other not—and a preference from ten

to twenty per cent. will be given to the one with a natural tail.

Gentlemen who do not reside on their estates, should prohibit their overseers, those great sticklers for customs, from docking colts. I have known several instances of fine colts being ruined in this way.

I am surprised that no notice has ever been taken of this grievance, (to the horse a sore one) by agricultural societies. Knowing you to be a warm friend of this noble animal, I submit his case in this respect to your care—he has many wrongs to complain of.

MONBODDO.

Maryland, April 10, 1825.

From the Genesee Farmer.

KEEP SEPARATE PASTURES FOR HORSES AND COWS.

ONE of our subscribers in the state of Pennsylvania, whose communications we always receive with pleasure, has furnished the following remarks.

"We became satisfied many years ago that sheep and milch cows ought not to run together in the same pasture; and we have kept them separate ever since, evidently to the increase of our milk and butter. The last season I kept my horses and cows in separate pastures, to the very visible benefit of both. They had a change of pasture as usual, but were not suffered to run on the same grass. All appeared to be in better condition than common, and the grass was of finer growth when compared with other similar fields in the neighborhood. I am satisfied that farmers suffer much loss by not attending to these small matters."

EFFECTS OF OIL UPON WATER.

THE following is a secret worth knowing. In rough weather, they, (the fishermen of the Bosphorus) spread a few drops of oil on the surface, which permits them to see clearly to a great depth. I was aware that oil would calm the surface of the sea; but until recently I did not know that it rendered objects more distinct beneath the surface. A trinket of some value had been dropped out of one of the upper windows of our palace into the Bosphorus; which at this place was ten or twelve feet deep. It was so small that dragging for it would have been perfectly useless, and it was accordingly given up for lost, when one of the servants proposed to drop a little oil on the surface. This was acceded to, with however but faint hopes of success. To our astonishment, the trinket immediately appeared in sight, and was eventually recovered.—*De Kay's Sketches of Turkey.*

HARD WATER.

It is a practice on what are called the "Barrens," in Ohio, where the water is strongly impregnated with lime, and of course unfit for many culinary uses, to mix with it ley of wood ashes. And we have seen among us, a small bag of ashes put into a kettle of water for washing clothes or dishes, in order to render it soft. The utility of this practice may be thus chemically explained. The lime which exists in water, consists of calcareous matter and carbonic acid; the alkali of the ley abstracts the carbonic acid, having a stronger affinity for it than lime, the latter is precipitated, and the water thus freed, becomes soft, and readily forms with soap, what is denominated suds. The presence of lime in water is soon ascertained by the crust which it forms in the inside of tea-kettles

in which it is boiled. The remedy should be remembered by those who live in lime districts.

SORE THROAT.

WE have known several in which this distressing complaint, even in its worst stage, has been immediately alleviated, and speedily cured, by the following simple remedy. Mix a pennyworth of pounded camphor with a wine glass full of brandy, pour a small quantity on a lump of sugar, and allow it to dissolve in the mouth every hour. The third or fourth generally enables the patient to swallow with ease.—*Newburyport Herald.*

PINE TREES.

THE town of Gilmanton, in the county of Rockingham, N. H. has a fine growth of timber suitable for masts. The Exeter paper contains the dimensions of about 20 white pine masts, which were felled by Messrs. E. & S. Eastman of Gilmanton Corner, during the past winter. The largest after the trees had been hewed, was 78 feet in length—the smallest 61 feet. Two of them have been sold for \$140, or \$70 each.—*Newburyport Herald.*

SCOTCH LEEK.

CAPT. MATTHEWS of the eastern shore of Maryland, presented us some weeks ago, with a very fine Scotch Leek from his garden. He informs us that he has two that measure at the surface of the ground—one nine and a half, and the other nine inches in circumference. They are kept as they ought to be, for seed. Beat this who can.

Since writing the above, Capt. Matthews has brought to our office, a stalk of *Tart Rhubarb*, which measures five feet four inches in height. Such specimens as these of garden vegetables, are silent but eloquent witnesses of the skill and care of their worthy cultivator.—*American Farmer.*

ITALIAN SHEPHERDS.

ROME, Feb. 10, 1834.—At the close of the last letter, we were at Mola, from whence we retired from the coast, and ascended the mountains. A scanty vegetation supports a few flocks of sheep and goats, under the care of shepherds. A shepherd is a picture of Robinson Crusoe without his umbrella. He is clothed in skins, with the hair or wool outward; he has a pole, or sometimes a gun in his hand, and in late years the shepherds were occasional robbers, as they always have been in the East. A shepherd is at a short distance a living Satyr. It is an idle life, and therefore the poets, being an idle race, have praised it. These hinds, ignorant and rude as they seem, are probably as respectable in the scale of men, as the shepherds that Virgil drew his pretty pictures from. In the time of Virgil the husbandmen and pastoral people of Italy were half of them slaves, as much the property of their masters as the flocks themselves, and had as little mental cultivation as civil rights. This road a few years ago was unsafe for travelers who had money or who had not. If they were unprovided for the robbers' occasions, they were carried off captives, and their ransom fixed according to their papers or appearance. If not ransomed, they were killed on the appointed day, for the robbers were men of their word, especially in threats. There was no difficulty in this vocation, for the whole population favored those employed in it. This thriving business was suppressed by great severity, and the roads have of late been perfectly safe.—*Cor. N. Y. Jour. Com.*

From the Genesee Farmer.

BLEEDING CATTLE.

BLEED your working oxen about this time, and it will prevent their heating so much while laboring—it will soon start off their old coat of hair, make them more hearty and healthy, and they will perform at least one third more labor.

Supply troughs in various places for your horned cattle, horses and sheep, and see that they are constantly supplied with salt in them.

Cut your calves' tails before they are weaned from sucking, and they will never be troubled with the horn ail. If you neglect so to do, take the year olds and cut off the ends of their tails about one inch, and let it bleed pretty freely; and if it does not, take a stick and whip it until it does bleed—if it is likely to bleed too much, take a puff, divide it, and tie one half of it on, and it will very soon stop the blood. Delays are dangerous.

G. H.

INDUSTRY.

THERE are few qualifications of more utility or that come to us more recommended by high authority, than this one of industry. The famous Duke de Sully, the minister, told the court he had no leisure for amusements; he rose at four daily. Michael Angelo labored during the night, sometimes going to bed with his clothes on, merely for a short time, and rising again to resume his labors. The minute account which Dr. Johnson gives us of the course of life of the great Milton, shows how preciously that illustrious poet valued the use of time. The industry of some writers has been shown in the magnitude of their works; Wickliffe could afford to have two hundred of his works destroyed, and still he may be regarded as a voluminous writer; Prynné who flourished at the period of the Commonwealth, wrote more than forty folio and quarto volumes; Anthony Arnauld composed more than one hundred works; and Lope de Vegas assures us that he himself wrote, on the average, five sheets per day during his life. In nothing in fact, are there greater distinctions of merit occasioned between men, than in industry and idleness. Some one reminded Montesquieu, that idleness was placed among the pleasures of heaven; it should rather, said the great philosopher, be accounted as one of the torments of hell; and this is the judgment which every experienced man will be inclined to concur in. Louis XIV. warned his son that there was nothing, even in the duties of the kingly office, more laborious than idleness; and a duke of the same nation, De Rohan, was known to have said that a greater curse could not befall a man than having nothing to do. Dr. Cheyne, a late penetrating and acute physician used to say, that the headaches, cholics, nervous pains and disorders, so much complained of by certain classes in this country, were universally the produce of idleness, and fulness of bread.

ITEMS.

Old Cheese. A good quantity of old cheese is the best thing to eat when distressed by eating too much fruit, or oppressed with any kind of food. Physicians have given it in cases of extreme danger.—*Northern Farmer.*

One of the favorite dishes of the late King of France was soup made of sorrel, white beans and eggs. He frequently dined exclusively from this dish and bread, and observed that his dinner cost him less than two pence.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, MAY 28, 1834.

FARMER'S WORK.

COMPOSTS. The effects of composts are very beneficial, especially in grass lands. The too common practice of spreading barn yard manure over mowing or meadow land is very wasteful and extravagant. Most people think that they have nothing more to do than to pile on barn yard manure in great quantity on any soil, and for each and every sort of produce, and their crops and their fortunes are made. But the truth is that the application of dung to land in tillage is sometimes not merely useless but absolutely injurious. We have heard it asserted by an experienced cultivator that he actually nearly destroyed his grass in a mowing lot by spreading on the soil in the spring a quantity of fresh dung taken from his pig sty. "The dung" he said "was of too hot a nature, and caused the turf to be so scorched by the sun that the grass was burnt up." It is true that fresh animal dung, applied to plough-land does not often produce so bad an effect. But the manure in that case by mixing with the soil forms a compost, and the dung is, as it were, diluted with earth. Still we hear farmers complain, in dry seasons, that the dung which they apply to their soil does more harm than good, by increasing the effects of drought. But if it were well mixed before it was applied with two or three times its bulk of earth it would preserve against drought instead of increasing it. A plant will no better grow on a muck heap than on a sand heap; and in some cases pure sand would be a better application to increase the fertility of a soil than unmixed dung.

John Young, Esq. of Nova Scotia, in a work entitled "*Letters of Agricola*" has the following remarks on composts:

"A good compost may be made simply by a mixture of surface mould and barn yard dung without any particular rules for the quantity of each. Sometimes two parts of dung are used for one of earth; sometimes they are mixed in equal quantities, and it is not uncommon to compound two parts of earth with one of dung. The use of the earth is to imbibe the gas or effluvia arising from the dung, which is decaying or putrescent." The only error into which the farmer can run, is to supply such an inconsiderable quantity of earth as will be incapable of imbibing the elastic and volatile particles, and thus by his own mismanagement occasion a waste of vegetable aliment. One cart-load of soil to two of dung is the least proportion which he should ever attempt to combine, and perhaps if the two were mixed equally, he would be compensated for the additional labor and expense.

"The whole art of composting is to arrange the materials in alternate layers,—to shake up the litter and dung with a hay fork that it may lie loosely, to cover the top and sides with earth, and to give it a sloping direction that it may carry off excessive moisture. Its height should never exceed four feet, or four and an half; and its breadth should be such that a man on either side may be able to fling the ingredients into the centre without trampling on the heap; for compression in all cases retards the putrefactive process. If the mass after being compounded, is long in generating heat, urine, salt water, or even fresh water, poured on the top, slowly, that it may ooze downward will

bring it on with rapidity. On the other hand should the process advance with too great violence, which can always be known by keeping a stick in the middle, and drawing it out occasionally for trial, the fermentation must be restrained by turning over the dunghill and mixing anew the ingredients. This will not only put a stop to the mischief, but facilitate a second fermentation; and as thus fresh particles of earth will be brought into contact with the decomposing matter, the whole will be enriched and impregnated with the fertilizing particles. These general views are applicable to every species of compost.

"Simple earth, although excellent for bottoming and strewing over the pit dug near the barn, is of all materials the most unprofitable in compost dunghill. When free from all foreign mixture it contains nothing on which the fermenting process can operate, it brings no addition to the mass of fertilizing matter. It is the recipient of elementary principles, but contributes none of them itself; and as far, therefore, as its agency is concerned it is unproductive and unprofitable. A matted sward, thickly entangled with roots, or mud dragged from the bottom of ditches, and replete with aquatic plants, are clearly preferable on this account, that, besides bringing earth to the composition, they supply a large proportion of vegetable matter. Whenever the soil must be carted to the heap, it is better to lay out the expense in transporting these enriching materials, because they will not only absorb and retain the evaporating gases, but greatly augment the quantum of manure."

WEEDS. M. R. M. Williams according to the *Genesee Farmer*, states that he paid a premium to children for gathering cockle plants by the hundred, in the spring from his fields; and it is probable that in almost every neighborhood there may be found boys, who for a trifle would willingly engage in such services. Job work is much more exciting than day labor. The boy who is intent on filling his bushel, will be too much engaged to watch the sun. It is a cheap way to clear our fields of bad weeds; and to train those who would otherwise be idle to habits of industry, is patriotic and benevolent.

"When I first came on the farm on which I now reside, one of my meadows was much injured by the sour dock. In the spring, after the frost was out, before the ground was settled, I found the roots come out easily. I offered a bounty of one shilling, (12 1-2 cents) a bushel for dock roots to be gathered on my own land; and the children in the neighborhood engaged with zeal in the business. They pulled about eight bushels, and I have never been troubled with them since. I believe the Canada thistle may be eradicated in the same way."

For the *New England Farmer*.

LOCUSTS.

MR. FESSENDEN—*Dear Sir*, There seems to be much disagreement respecting Locusts, and it is singular that the subject is not better understood.

There must be mistakes somewhere as to the 17 years.—They appeared first after the settlement of the country in 1633, according to Gov. Bradford, Rev. Wm. Hubbard and Mr. Prince.

"1633. This Spring, especially all the month of May, there are such (Numbers) of a great sort of Flies, like for Bigness to Bumble-Bees, which come out of Holes in the Ground (in Plymouth

Colony), replenish all the Woods, eat the green Things, and make such a constant yelling Noise, as all the Woods ring of them, and (deafens) the Hearers. The Indians tell us that Sickness will follow: and so it (proves) in June, July and August. They have not by the English been heard or seen before or since—(Gov. Bradford's register): (i. e. to the beginning of 1647, when Gov. Bradford ends his History, but have in like Manner at distant Periods risen up since, and are known by the name of Locusts)."—*Prince's Annals of New England*, Part II, Sect. 2, page 92.

Historical Collections, 2d series, vol. iii, p. 196, Notes on Plymouth, Mass. supposed to be written by the late celebrated antiquarian Samuel Davis, Esquire—"Locusts made their appearance in great numbers, June 1804, half a mile west of the town. As 17 years is said to be their period, we may expect them again in 1821."

MASS. HORTICULTURAL SOCIETY.

EXHIBITION OF FLOWERS.

Horticultural Rooms, Saturday, May 24th.

THOMAS MASON, Charlestown Vineyard—*Nerium splendens*, *Rhododendron ponticum*, *Celsia cretica*, *Verbena aubletia*, *Calceolaria corymbosa*, *Cactus speciosa*; *Anemones*, *Tulips*, *Roses*, *Stock Gillyflowers*, *Geraniums*, &c.

WINSHIP—variety of Flowers.

By order of the Committee,

JONA. WINSHIP, *Chairman*.

See *Advertisement*, next page.

ITEMS OF INTELLIGENCE.

The Weather. The cold weather of last week is noticed in papers from all quarters. There was snow in many places, and ice formed from an eighth to a fourth of an inch in thickness. The region about Albany was covered with snow on Thursday morning, and the trees many of which were in blossom, were covered with a coat of snow and ice. In New York city, the same morning, there was ice in the streets a quarter of an inch thick, and at 10 o'clock, A. M. icicles eight inches long hung from the eaves. In Philadelphia, ice was a quarter of an inch thick; early fruit was dropping from the trees, and fields of rye in the vicinity were materially injured. In some towns in the western part of Connecticut, the ground was covered with snow, the ice in the ponds was nearly strong enough to bear a man, and it was feared that the rye was much injured. In Saratoga, N.Y. the snow was six inches deep on a level. A farmer had some difficulty on Thursday in getting his horses and wagon through the snow from Saratoga to Albany.

In this village, there was ice two or three mornings in succession, and on Thursday morning, there was a little snow on the ground. We hear from towns to the west and northwest, that snow fell to the depth of two or three inches on Wednesday night, and that it was blown into

drifts some of them 3 or 4 feet deep. Fruits have been materially injured, and some kinds probably destroyed; and where corn and garden vegetables were out of the ground, they were fatally nipped. In some places pastures became brown, and the leaves on maple and some other forest trees withered.—*Northampton Gazette.*

Tremendous Snow Storm. Such a storm as is now visiting this section of the State, has not been experienced since 1816. It commenced snowing and blowing in the afternoon of Wednesday, and continued through the night, and is now (Thursday, 12 o'clock,) bearing down upon us from the North with unabated fury. The snow is now nearly twelve inches deep. The extent of damage which will follow its train must be considerable.—*Burlington, Vt. Sentinel of the 16th inst.*

Sleighting in May. A letter from the house of Grant Thorburn & Son, dated Albany, May 16th, to a gentleman of this city, states that "it commenced snowing on the night of the 14th, and continued the whole of yesterday with a severe frost, which no doubt has killed all our fruit. Mr. S. has just called and informs us that every thing that was above ground, say corn, beans, potatoes, &c. are gone. It is a fact worthy of record, that a farmer from Saratoga, about thirty miles from this, stated to us this morning that his horses and wagon had some difficulty to get through the snow yesterday. He measured its depth and found it lay on a level six inches in depth. We are of opinion that we shall not have one peach, plum, or any other kind of fruit in this section of the country. Almost every sort of seed must be planted over again.—*Sun.*

An insolvent applied to the Commissioners at Bristol for his discharge; among the assets he laid before the board, was thirty children all by one wife, who had three times presented him with twins. His creditors mostly were medical practitioners. He was discharged.

Curiosities. In excavating the Lancaster Lateral Canal, near a place called the "Deep Cut," bones of extraordinary dimensions have been discovered.—Among the curiosities found, is a horn six feet in length, weighing 44 lbs., and measuring at the butt-end sixteen inches. Also a tooth weighing 6 3-4 lbs.

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY OF WILLIAM KENRICK in NEWTON, 5 1/2 miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated Pears alone, 150 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus Multicaulis* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White Flowering Horse Chestnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the *Pæonies*, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea.—Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

GOOSEBERRIES.

A new importation of superior kinds, just received, of all colors, by WM. KENRICK, Newton.

MASSACHUSETTS HORTICULTURAL SOCIETY.

A stated meeting of this Society, will be held at their Hall, 81 Cornhill, (lately Market Street) on Saturday the 7th day of June, at 10 o'clock. R. T. PAINE, Rec'g. Sec'y.

MACHINE FOR CUTTING FODDER.

THE simplicity of the construction of this Machine, and the small probability of its getting out of repair, together with the neat and rapid manner that it performs its work, certainly renders it a desirable article for the purposes for which it is intended. It is constructed on an entire new principle from any heretofore invented, and will cut an hundred weight of hay in ten minutes, two inches long, can also cut any length from three inches to one-fourth of an inch; it is fed by placing the fodder in a hopper that stands perpendicular, the knife playing horizontally underneath, by which means all the complicated machinery for feeding and the power necessary to drive it is avoided.

The Subscriber having become the proprietor of the right of making, &c. said machine, in and for the State of Massachusetts, solicits the public to call and examine for themselves. Said Machine is for sale at the store of PROUTY & MEARS, No. 12 Commercial street, Boston. DAVID P. KING,

Who is also Agent for the States of Vermont, New Hampshire, Maine, and Rhode Island. cow6w a 2.

VALUABLE NEW WORK ON AGRICULTURE.

This day Published, by GEO. C. BARRETT, at the Office of the N. E. Farmer.—The

COMPLETE FARMER and RURAL ECONOMIST,

By THOS. G. FESSENDEN, Esq.

Containing a compendious epitome of the most important branches of Agriculture and Rural Economy, and the following subjects arranged in order:

Soils. Wheat, Beans, Mangel Wurzel,
Grasses, Rye, Swine, Ruta Baga,
Grain, Oats, Lime & Gypsum, Potatoes,
Neat Cattle, Barley, Fences, Haymaking,
Barus, Millet, Hedges, Ploughing,
Dairy, Hops, Sheep, Poultry,
Henip, Peas, Horses, Wood:

and to which is added—Descriptions of the most approved Implements and Machines, with Engravings.

The work is printed on the best of paper, and is intended for a Farmer's Directory, which every farmer should be possessed of; and relying upon an extensive sale will be afforded at the low price of \$1. m 21

DAHLIAS.

A Collection of fine Double DAHLIAS, started in pots at 50 cents, for sale at the New England Seed Store, 51 & 52 North Market street. G. C. BARRETT.

ZINC WARE.

Just received, a further supply of Zinc Milk Pans, Kettles and deep Bake Pans, and for sale at the Agricultural Warehouse, No. 51 and 52 North Market Street.

The manufacturers of this article having closed their works, no more of them can be procured at present,—and as the season is at hand when these are most wanted, and as they are found on trial to produce a great increase of Milk, they are highly recommended to the public as one of the improvements of the day. my 14

FULL BLOOD SHORT HORN HEIFER CALVES FOR SALE.

Four full blood Short Horn Calves for sale from Imported Stock, sire and dams, if application is made in one week to the Publisher of the New England Farmer, he will furnish particulars as to prices, ages, &c. may 14

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

1 Case wet (but not damaged) Bishops Lawn.

1 do. do. do. Book Muslin.

Also, 1 do. Superfine 6-4 Cambric Dimities, which will be offered by the Piece at 25 per cent. less than cost of importation. m 14

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table mats. a 16.

BRIGHTON MARKET.—MONDAY, May 26th, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 293 Beef Cattle, (including 30 unsold last week,) 10 pairs working Oxen, 14 cows and calves, 500 sheep and 120 swine. 165 beef cattle remain unsold, all of which are of the first quality, and very large, would probably average when slaughtered, from 11 to 12 hundred each.

PRICES. *Beef Cattle*—Last week's prices were not supported, and a few sales only were effected in the forenoon. Drivers were firm for prices nearly equal to last week, and Butchers equally as firm not to pay so much. We noticed one Ox sold for \$7 per hundred, (probably purchased without much judgment.) We quote prime at 6 33 a 6 50; good at 5 68 a 6 25; thin at 4 50 a 5 75; some of which were very ordinary.

Working Oxen—No sales noticed.

Cows and Calves—Sales at 23, 24, 25, 27 and \$30.

Sheep—We noticed a lot sheared and ordinary taken at 1 75, a lot at \$2, 2 75, 3, 3 25 and 4 50.

Swine—Sales brisk, one large lot of barrows were taken at 6c, a lot at 5 1/2 for sows, and 6 1/2 for barrows, at retail 5 1/2 a 6 for sows, and 6 1/2 a 7 for barrows.

MISCELLANY.

WRITINGS OF WASHINGTON.

In noticing some weeks ago these admirable volumes, published by Mr. Sparks, we referred to some of the early papers of Washington. Among these, written in his own hand, is a series of maxims under the head of "*Rules of civility and decent behaviour in company and conversation.*"—Of these there are 110. The only specimens published we extract, and agree with Mr. Sparks in the opinion, that "whoever has studied the character of Washington, will be persuaded that some of its most prominent features took their shape from the rules thus early selected and adopted as his guide."—*N. Y. American.*

1. Every action in company ought to be with some sign of respect to those present.
2. In the presence of others sing not to yourself with a humming noise, nor drum with your fingers or feet.
3. Sleep not when others speak, sit not when others stand, speak not when you should hold your peace, and walk not when others stop.
4. Turn not your back to others, especially in speaking: jog not the table or desk on which another reads or writes, lean not on any one.
5. Be no flatterer, neither play with any one that delights not to be played with.
6. Read no letters, books or papers in company, but when there is a necessity for doing it you must ask leave. Come not near the books or writings of any one so as to read them, unasked. Also, look not nigh when any other is writing a letter.
7. Let your countenance be pleasant, but in serious matters somewhat grave.
8. Show not yourself glad of the misfortunes of another, though he were your enemy.
9. When you meet with one of greater quality than yourself, stop and retire, especially if it be at a door, or any strait place, to give way for him to pass.
10. They that are in dignity or office have in all places precedence; but whilst they are young, they ought to respect those that are their equals in birth or other qualities, though they have no public charge.
11. It is good manners to prefer them to whom we speak before ourselves, especially if they be above us, with whom in no sort we ought to begin.
12. Let your discourse with men of business be short and comprehensive.
13. In visiting the sick, do not presently play the physician, if you be not knowing therein.
14. In writing or speaking, give to every person his due title, according to his degree and the custom of the place.
15. Strive not with your superiors in argument, but always submit your judgment to others with modesty.
16. Undertake not to teach your equal in the art himself professes: it savors of arrogance.
17. When a man does all he can, though it succeeds not well, blame not him that did it.
18. Being to advise, or reprehend any one, consider whether it ought to be in public or in private, presently or at some other time; also in what terms to do it; and in reproving, show no signs of choler, but do it with sweetness and mildness.
19. Take all admonitions thankfully, in what place soever given; but afterwards not being culpable take a time or place convenient to let him know it that gave them.

20. Mock not, nor jest at any thing of importance, break no jests that are sharp biting, and if you deliver any thing witty and pleasant, abstain from laughing thereat yourself.

21. Wherein you reprove another be unblameable yourself, for example is more prevalent than precept.

22. Use no reproachful language against any one, neither curses nor reviling.

23. Be not hasty to believe flying reports, to the disparagement of any one.

24. In your apparel be modest, and endeavor to accommodate nature rather than procure admiration. Keep to the fashion of your equals, such as are civil and orderly with respect to time and place.

25. Play not the peacock, looking every where about you to see if you be well decked, if your shoes fit well, if your stockings sit neatly and clothes handsomely.

26. Associate yourself with men of good quality if you esteem your own reputation, for it is better to be alone than in bad company.

27. Let your conversation be without malice or envy, for it is a sign of a tractable and commendable nature, and in all cases of passion admit reason to govern.

28. Be not inmodest in urging your friend to discover a secret.

29. Utter not base and frivolous things amongst grown and learned men; nor very difficult questions or subjects among the ignorant, nor things hard to be believed.

30. Speak not of doleful things in time of mirth, nor at the table; speak not of melancholy things, as death and wounds, and if others mention them, change, if you can, the discourse. Tell not your dreams but to your intimate friends.

31. Break not a jest where none take pleasure in mirth. Laugh not aloud nor at all without occasion. Deride no man's misfortune, though there seem to be some cause.

32. Speak not injurious words neither in jest or in earnest. Scoff at none, although they give occasion.

33. Be not forward, but friendly and courteous; the first to salute, hear and answer, and be not pensive when it is a time to converse.

34. Detract not from others, but neither be excessive in commending.

35. Go not thither, where you know not whether you shall be welcome or not. Give not advice without being asked, and when desired, do it briefly.

36. If two contend together, take not the part of either unconstrained, and be not obstinate in your opinion; in things indifferent be of the major side.

37. Reprehend not the imperfections of others, for that belongs to parents, masters and superiors.

38. Gaze not on the marks or blemishes of others, and ask not how they came. What you may speak in secret to your friend deliver not before others.

39. Speak not in an unknown tongue in company, but in your own language, and that as those of quality do, and not as the vulgar. Sublime matters treat seriously.

40. Think before you speak; pronounce not imperfectly, nor bring out your words too hastily, but orderly and distinctly.

41. When another speaks, be attentive yourself, and disturb not the audience. If any hesitate in his words help him not, nor answer him not till his speech be ended.

42. Treat with men at fit times about business, and whisper not in the company of others.

43. Make no comparisons; and if any of the company be commended for any brave act of virtue, commend not another for the same.

44. Be not apt to relate news, if you know not the truth thereof. In discoursing of things you have heard, name not your author always. A secret discover not.

45. Be not curious to know the affairs of others, neither approach to those that speak in private.

46. Undertake not what you cannot perform, but be careful to keep your promise.

47. When you deliver a matter, do it without passion and with discretion, however mean the person may be you do it to.

48. When your superiors talk to any body, hear them, but neither speak nor laugh.

49. In disputes, be not so desirous to overcome as not to give liberty to each one to deliver his opinion, and submit to the judgment of the major part especially if they are judges of the dispute.

50. Be not tedious in discourse, make not many digressions, nor repeat often the same matter of discourse.

51. Speak no evil of the absent, for it is unjust.

52. Make no show of taking great delight in your victuals, feed not with greediness, cut your bread with a knife, lean not on the table, neither find fault with what you eat.

53. Be not angry at the table whatever happens, and if you have reason to be so, show it not; put on a cheerful countenance, especially if there be strangers, for good humor makes one dish a feast.

54. Set not yourself at the upper end of the table, but if it be your due or the master of the house will have it so, contend not lest you should trouble the company.

55. When you speak of God or his attributes, let it be seriously, in reverence and honor, and obey your natural parents although they be poor.

56. Let your recreations be manful not sinful.

57. Labor to keep alive in your breast that little spark of celestial fire called conscience.

NEW WORK ON FLOWERS.

Just published, the Florist's Manual, with Eighty beautifully colored Engravings, being the best work adapted to American Floriculture extant—price \$2.50. GEO. C. BARRETT.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

¶ No paper will be sent to a distance without payment being made in advance.

NO. 47.

BROOKS'S PATENT SILK SPINNING MACHINE.

We are happy to have it in our power to present to our readers a cut and description of the above-named very valuable implement.

By the different arrangements of this machine, it will spin, double and twist Sewing Silk or Twist, two or three threaded; and spin four threads at once for warp on the spools ready for warping, or filling on the quills ready for the shuttle for weaving, all of any size or twist that is wanting for any common use.

Experience has fully proved that by uniting the filaments of silk as they are drawn from the cocoons, wet, in their natural glue, before suffered to dry, the thread is more firm, smooth and strong, than it can be if reeled and dried before it is twisted. It may be noticed that this machine prepares the thread in a finished state for almost any thing that silk is used for.

The Inventor of this Machine has had awarded to him a premium from the Plymouth, and from the Massachusetts Agricultural Societies. Also, a medal and premium from the Philadelphia Agricultural Society; and certificates from many scientific gentlemen that have witnessed the utility of the invention.

From the Boston Advocate.

CEMETERY.

A MAGNIFICENT plan of a rural cemetery, after the manner of Pere-la-Chaise, and our own beautiful Auburn, has been commenced and is in progress in England.

It is called the Great Western Cemetery, situate at Notting Hill, just beyond Kensington Gardens, two miles from London. The capital is £31,500, divided into shares of £21 each. Half shares at £10, 10s. each. This is more liberal than the plan of the Cemetery at Auburn, where \$60 is the price of a share, and no half shares are sold. The Notting Hill Cemetery is managed by 24 Directors. Holders of 5 shares are qualified for the direction, and joint holders of 100 shares may nominate a Director.

The grounds embrace *fifty-two acres*, in extent, equi-distant from Oxford street and Picadilly.—Twelve acres have been already enclosed and adorned with magnificent trees and beautiful shrubbery. Two hillocks, with ancient trees, are preserved. The rest of the estate is at present let as a farm.

The spot is represented to be capable of becoming equal in extent to the famed Pere-la-Chaise, near Paris. We heard a gentleman, recently from Europe, remark the other day, that the natural advantages of the Cemetery at Auburn were incomparably superior to all that nature had done, or art could do for Pere-la-Chaise. Notting Hill he had not seen.

The grounds are open daily for public inspection. As soon as £15,000 are subscribed, the work is to be commenced, so as to complete the whole Cemetery this year. The round tower, the ancient temple church, is to be a model for one of the funeral chapels, which are to be erected on the grounds.

The Treasurer guarantees the repayment of the subscriptions, provided a sufficient capital is not raised. Subscribers may transfer their shares and take a piece of freehold land instead, comprising a site capable of containing ten coffins, or five, for half a share. Each person employs his own architect, the Company not intending to act as undertakers.

This Cemetery has an additional interest, from its being designed for those who die out of the pale of the English Church as well as in it. Such is the absurdity of bigotry in established religions, and in laws against sacrilege, &c. that by the laws of England a dissenting clergyman cannot officiate in *consecrated* (that is, Church of England) burial grounds, nor can an Episcopalian minister officiate in *unconsecrated* grounds. The consequence is, that the bodies of churchmen and dissenters are kept as far apart, after they are dead, as their creeds were, while living. This absurdity has not failed to strike some liberal minds in England. In a debate, March 18, 1834, in the British Commons, Lord Althorp said, he wished some other plan than by legislative enactment could be devised, by which the difficulty of non-parochial burial for dissenters could be obviated.

The Nottingham Cemetery, being without the bounds of a parish, it admits of ministers in surplices and clergymen in plain coats, performing the rites of sepulture, at the same time, for the man who has received the sacrament kneeling in the chapel, and for another who took it, seated in his pew.

There must indeed be "many mansions" in heaven for people who believe, as they do in England, that a churchman and a dissenter cannot lie quietly in their graves, in the same church yard!

CHOICE OF OCCUPATION.

It is a very common error with parents, in determining upon the future occupations of their children, to fix upon a profession, or some sedentary employment, for those of a weakly or delicate constitution; while to the robust and vigorous, is assigned a more active and laborious occupation, demanding considerable bodily exertion, and repeated exposure to the open air. As a general rule, the very opposite of this course should be pursued: the robust being the best able to bear up against the pernicious effects of that confinement and inactivity, to which the enfeebled constitution will very speedily fall a prey; while

the latter will be materially benefitted by the very exertion and exposure to which it is supposed to be unadapted.

When we examine the individuals who compose the various trades and occupations, and find certain classes to present, very commonly, a pale, meagre and sickly aspect, while others are replete with health, vigor, and strength; we are not to suppose that because the pursuits of one demand but little, and those of the other considerable bodily strength, the first are best adapted to the weakly, and the latter to the strong: we are rather to ascribe this very difference in their appearance, to the influence their several occupations exert upon the health of the system.

Let the most healthy and vigorous individual exchange his laborious occupation in the open air, for one which requires confinement within doors, and but little exercise, and his florid complexion, well developed muscles, and uninterrupted health, will very speedily give place to paleness, more or less emaciation, and debility, and occasionally to actual disease of the stomach and lungs. On the other hand, the reverse effects will be produced, by the sedentary exchanging, before it is too late, their confinement and inactivity, for some active employment in the open air. These are important considerations, an attention to which, in the choice of a profession, would be the means of saving not a little suffering,—in many instances of prolonging life.—*Baltimore Farmer.*

From the Boston Courier,

AGRICULTURE.

THERE are few employments more dignified than whacking bushes. Cincinnatus is the greatest name in Roman history, only because he was after his victories a farmer in a small way, subsisting chiefly on turnips of his own raising. The old Roman of the present day, also seems to gain some favor with a part of the public from his agricultural pursuits at the Hermitage. May he have a speedy and happy return to them!

The farmer is a lucky man—he is subject to few cares, diseases or changes. He holds in fee a certain part of this planet, in the shape of a wedge, or inverted pyramid, running from the surface down to the centre, together with the atmosphere above it; and if any man should build a tower overhanging his line by a single brick, though a thousand feet in the air, it may be abated as a nuisance. It is a great thing to have a legal and equitable title to a portion of earth, to cultivate it, and to owe a support to the application of strength, rather than the misapplication of wit. The farmer is independent of all but Providence—he calls no man master.

"He would not flatter Neptune for his pitchfork."

He is not only a friend of humanity, but he is kindly disposed towards brutes. An ox is to him in the light of a friend, a cow is a benefactor, and a calf is almost a child. He is clothed by the sheep, and the cosset lamb is a foster brother of his children, who have a heavy day when their mute friend is sold to the butcher. The farmer has little to buy, and much to sell, his means are large and his waste little. He is an especial fa-

vorite of Ceres and Pomona, but he cares little for Bacchus, Phœbus and other idlers.

He puts his hand, and a huge one it is, to the plough, and if he looks back, it is in a furrow like the wake of a boat. In May he puts a potato or two in the earth, and in October he digs in the same place and finds a peck of them. In spring he covers with earth three or four kernels of maize, and in autumn he finds ears enough on the spot to furnish the materials for many loaves. He hides in the soil a seed no bigger than a large bed-bug, and in a few weeks a vine appears with several pumpkins attached to it of the capacity of four gallons. If the merchant secures to himself a gain of ten dollars in the hundred, happy man is his dole; if the farmer get not an increase of some hundred per centum, it is a bad season and an unfrequent occurrence.

"O fortunatos nimium," &c. as Virgil has it, or "he would be too happy a dog, if he only knew how to estimate his good fortune." But this man favored of fortune, this cultivator, whose reward is a direct consequence of his labor, this christian, who never trusted Providence in vain, this farmer who has a deed recorded of a portion of the earth—a part of the solar system—a particle of the universe, from which no ejector but death can oust him, and even Small-back cannot injure the title of the heirs—this ungrateful farmer himself is apt to forget his blessings, and to complain of hardship and the times. The times! what are the times to him, unless the seasons mentioned by the preacher, "a time to plant, and a time to pluck up that which is planted."

He should have no money to borrow and no notes to pay. Now and then a bee may sting him, but he avoids Jack Cade's peril from the bee's wax. "Some say," says this popular reformer, "that it is the bee that stings, but I say it is the bee's wax, for I did but seal a bit of paper, and I have not been mine own man ever since."

If the farmer has not much thought, the exemption frees him from much care. His countenance is never "sicklied over by the pale cast of thought," but it is round streaked and ruddy as the sunny side of a peurnain. His hand is hard, but his heart is soft. He has simplicity of character, and that preserves all his virtues—pickles all his good qualities.

Robinson Crusoe excites not our envy; we sigh not for "a lodge in some vast wilderness," our aspirations are for a house with a gable end, a well with a sweep, and a moss grown bucket, a dobbin, a dog that answers to the name of Towzer, a garden, a farm, a farmer's employment, and a farmer's appetite.

MANURING CORN.

A WRITER in the Genesee Farmer, considers the practice of manuring our lands in the hill, injudicious and unprofitable. As this practice prevails almost universally in this region, it may not be amiss to give the reasons for this opinion. Plants derive their nourishment from the small fibres of their roots. The extremities of these fibres are the mouths of the plant. Now the roots of corn extend to a great distance beyond the hill—as far below the ground, it is said, as the stalks grow above. Hence it is obvious that the manure will not benefit the plant, after the roots have extended beyond the circle where it is deposited. Whereas if it were equally distributed over the soil, the fibres would find nourishment from it

wherever they spread. The only benefit of hill manuring is to give the plant a vigorous start, and afterwards it is of little value. Another disadvantage is that if the warm weather be long, and the season dry, it is liable to fire-fang, as it is called, i. e. it does not rot, and of course does no good.—*Greenfield Gazette.*

RAIN WATER.

IN our country there falls rain, including melted snow, to the average depth of thirty-five inches. On a surface forty feet square, there falls yearly 34,909 wine gallons; and if all this were secured in cisterns, there would be nearly one hundred gallons for every day's consumption, or about three barrels. This water, if well preserved, would be the very purest and best for most domestic purposes. The horse and the cow prefer rain water to pump or well water; and though it would not be entirely governed by their decision, yet great respect is due to their judgment in such matters. The water of many wells is tinctured in such a way as to make it less fit for a solvent; and it does not so perfectly combine with nutritious substances to form chyle and nourish the human system. They who live in situations where water is not easily procured from the ground, may be told that the purest water is descending around them; and if they will only be at the necessary expense to secure this gift of heaven, they may provide an abundant supply. On such reservoirs the inhabitants of Palestine placed much dependence; and it is a merciful appointment of God, that in warm countries, where the greatest supply of water is needed, the most rain descends. We may yet find good capacious cisterns of brick or stone, and Roman cement, economical additions to our domestic convenience. A cistern ten feet square and ten feet deep, would contain one hundred and eighteen hogsheds of sixty-three wine gallons each, and would secure to most families a constant supply of water.—*Scientific Tracts.*

From the Maine Farmer.

CATTLE.

I HAVE thought it proper to follow the history, &c. of Mr. Vaughan's cattle, with a brief notice of those which I have brought here from Massachusetts. In some future communication I propose to give their pedigree, more particularly accompanied with some observations on the value of pedigree.—Before mentioning my own stock, I wish to say that the cow concerning which Mr. Vaughan has given you the details of an experiment in making butter, was exhibited as a fat cow in 1823, at Brighton, where I saw her. She was considered one of the most extraordinary animals for symmetry of form and fine quality of flesh, which had then ever been seen at that Show, —weighed 8 cwt. and sold her for near 55 dollars.

The following are the periods at which my Stock arrived at Hallowell:—April, 1830, bulls Hercules and the Young Sir Isaac and cow Twin Mother; June, 1830, heifer Chesnut Beauty, and two bull calves; November, 1832, bull Norfolk; November, 1833, cow Daffy.—The first mentioned bull, Hercules, was five eighths Improved Short Horn, one eighth Bakewell, and one quarter common or native blood. One of the bull calves had also a quarter of the common blood in him. All the rest of the above Stock are ENTIRELY of the Improved imported breeds, viz: Improved Short Horn, Herefordshire, and Bakewell. They were all bred by Hon. John Welles, of Boston, at his

farm in Dorchester.—I still own most of this Stock. The cow Chesnut Beauty, I sold together with a bull calf of hers, in June last, to Mr. Sumner Bixby, of Norridgewock. They carried the first premiums at the Somerset Show, last fall.—Daffy is the mother of Young Sir Isaac. I think I shall exhibit her at our next Cattle Show. I will not say of her what one of your correspondents has said of one of his cows, viz: that "her form is equal to that of any other cow," because I should not think such an assertion would receive much confidence, (for how does any man know what there is in the world that he has not seen?) but I should be pleased to have any one produce at the Show, a cow larger, handsomer or better.

SANFORD HOWARD.

SPONTANEOUS COMBUSTION OF DRUNKARDS.

THE spontaneous combustion of drunkards is a fact well established in Medical science. The following is among numerous instances which have been related by eminent physicians and others.

Dr. Peter Schofield, at a late address delivered at the formation of a Temperance Society in the township of Bastard, in the district of Johnstown, in the province of Upper Canada, states a case of spontaneous combustion which occurred in his practice. "It is well authenticated," says the Doctor, "that many habitual drinkers of ardent spirits are brought to their end by what is called spontaneous combustion. By spontaneous combustion, I mean when a person takes fire by an electric shock, and burns up without any external application. It was the case of a young man about twenty-five years old: he had been an habitual drinker for many years. I saw him about nine o'clock in the evening on which it happened. He was then as usual, not drunk but full of liquor. About 11 the same evening I was called to see him. I found him literally roasted from the crown of his head to the soles of his feet. He was found in a blacksmith's shop, just across the way from where he had been. The owner, all of a sudden, discovered an extensive light in his shop, as though the whole building was in one general flame. He ran with the greatest precipitancy, and on flinging open the door, discovered a man standing erect in the midst of a widely extended silver colored blaze, bearing as he described it, exactly the appearance of the wick of a burning candle in the midst of its own flame. He seized him by the shoulder and jerked him to the door, upon which the flame was instantly extinguished.

"There was no fire in the shop, neither was there any possibility of fire having been communicated to him from any external source. It was purely a case of spontaneous ignition. A general sloughing soon came on, and his flesh was consumed, or removed in the dressing, leaving the bones and a few of the larger blood vessels standing. The blood nevertheless rallied around the heart and maintained the vital spark until the thirteenth day, when he died, not only the most loathsome, ill-featured and dreadful picture that was ever presented to human view, but his shrieks, his cries, and lamentations, were enough to rend a heart of adamant. He complained of no pain of body; his flesh was all gone. He said he was suffering the torments of hell; that he was just upon its threshold, and soon should enter its dismal caverns; in this frame of mind he gave up the ghost. O, the death of the drunkard! Well may it be said to beggar all description. I have seen

other drunkards die, but never in a manner so awful and affecting. They usually go off senseless and stupid as it regards a future state!"—*Kingston Gazette*.

ARGUMENT TO CLEAN THE TEETH.

To warn the young reader of cleanliness, a subject or two, which, if not very pleasant to discuss, may lead to effects important to future health. No animalcules are found in the saliva, but numbers of different kinds may be discovered in the whitish matter sticking between the teeth; if it be picked out with a needle, or point of a tooth-pick, and mixed with a little rain water, and applied before the microscope, numbers will be visible; sometimes, indeed, so very numerous and active, that the whole mass appears alive. The largest sort, but few in number, move very swiftly; the second sort are more numerous, and have different motions; the third kind are roundish, and so minute that a grain of coarse sand would equal a million of them in bulk! They move so swiftly, and in such multitudes, that they seem like swarms of gnats or flies. Some or all of these three kinds may be found in the matter taken from between the teeth of men, women, and children, especially from between the grinders, even though they wash their teeth with great care. But from the teeth of persons inattentive to cleanliness, the matter affords another sort of animalcules, in the shape of eels. They all die, if vinegar be applied; hence it has been concluded, that a gargle of vinegar is good to preserve the teeth and gums from injuries these little creatures might occasion.—*Shaw's Microscopic Objects*.

TO SAVE HORSES' SHOULDERS FROM BEING CHAFED BY THE COLLAR.

SOME of the gentlemen of South Carolina are in the habit of making long journeys by land in their own conveyances, and are obliged to resort to every method of affording relief to their horses. From one of these I derived the following simple expedient for preventing the shoulders of harness horses from being chafed by the collar. The shrewd practical sense of the gentleman referred to, is a strong guarantee of the value of his suggestions. A short trial of my own has fully convinced me of the utility of what is classically denominated the sweater. This simple and effectual contrivance is made of two pieces of leather, which for an ordinary horse may be about 5-12 inches wide at the top, and 6 at the bottom, and 9 at the greatest protuberance, the front edge being straight, the posterior curved with a gradual swell adapted to the shape of the collar behind. These pieces must be sowed together at the bottom, and connected at the top by two small straps and buckles, so as to be let out or taken up at will. The lower part must be so shaped as to fit the throat of the horse. A strap passes from the bottom of the sweater between the legs to the girth by means of which it is kept in place. The strap should not be too tight, lest it might incline a balking horse to stop, when ascending a hill; and the buckle at the end near the girth, if it chafe may be covered. The leather should be tolerable stout upper, rendered pliant by the occasional application of tallow to the outside. The inner side should be kept clean and smooth.

The sweater is in fact a sheath to the shoulders, and the collar rests on it instead of the skin of the animal.

Waynesboro, Va.

From the Farmer's Journal.

MULBERRY HEDGES.

MUCH has been said within a few years, and probably something done in the United States on the subject of growing silk. The thought has probably occurred to but few, that the white mulberry tree will answer the double purpose of making a hedge fence and feeding silkworms. This may be a valuable idea to many farmers in Vermont, who are not furnished with a supply of materials for fencing. The mulberry is a tree of rapid growth, and very easily propagated by being stuck in the ground.

Those who wish the mulberry for hedging without feeding silkworms from it, will probably need to cut the main branches to prevent them from growing too high. Mulberry seed should be sown the last of April, in rows, in ground well prepared. I am not able to say what soil is most natural, but it will undoubtedly grow sufficient for hedges in most soils. A mulberry nursery will need considerable care the last year; and in the Vermont climate, will need to be secured from the weather the first winter, which may be done by laying rails between the rows, and throwing a coat of straw a few inches thick, over the whole.

H. P.

CATERPILLARS.

THE parent moth of the common caterpillar, lays its eggs on the small branches of our fruit trees, cementing them together with a gummy substance which preserves them from the weather. The deposit has often some resemblance to an open handed thimble; but its form is not always regular, and sometimes it extends but little more than half round the twig. Our friend Charles Gifford of Ledyard, had observed that these are generally placed on the lower branches, and for several years has been in the practice of picking them from his trees before the warmth of the season was sufficient to bring forth the young insects. The destruction of every deposit prevents the ravages of a nest of caterpillars. He is decidedly of opinion that it is the most expeditious and economical way of ridding an orchard of this nuisance; and we fully concur after having made a fair trial. The eye soon becomes practised in this search; and what at first seemed difficult to find is readily detected.

The work may be done at any time previous to the opening of the bud.—*Gen. Farmer*.

HAVE YOU PLANTED A VINE?

If you have planted one that produces good fruit, take care of it and propagate it by cuttings and layers; and its fruit will richly repay your labor. If you have not, buy or beg one, and plant it the present spring. The second year after planting it will produce you fruit, which will every year increase as the plant enlarges. The fruit will be found to be wholesome and grateful, and you will realize the pleasure of sitting under your own vine during the intense heats of summer; and you will wonder that you have lived so long without enjoying this pleasure.

The native kinds most worthy of cultivation are the Isabella, Wiune, and Catawba, all hardy thrifty and abundant bearers, and their fruit ripening in the order in which they are named. A little experience will make you familiar with their management, and convert the labor required for their care into a recreation.—*Cultivator*.

MASS. HORTICULTURAL SOCIETY.

Boston, May 30, 1834.

To the President of the Mass. Horticultural Society: SIR—I transmit herewith a bottle of seeds of the Deodar tree, or cedar of the Himalaya mountains, (*Pinus deodara*.)

It was sent me by Professor Wallich of Calcutta, and is stated to be a tree of very large size, exceeding the cedar of Lebanon in beauty and magnitude. Dr. Wallich thinks it will grow in many parts of the United States.

Very respectfully, JACOB BIGELOW.

Please to distribute the seeds to members who wish them. J. B.

A part of the seeds were distributed among the members, and the residue were put into the hands of the gardener at Mt. Auburn.

FLOWERS EXHIBITED.

Saturday, May 31, 1834.

Magnolia purpurea, purpurea var. and cordata, Early white Italian honeysuckle, Double white hawthorn (*Crataegus oxyacantha pleno*), scarlet (*C. monogynia*), and a new scarlet variety (*C. monogynia* var.), from Mr. JOHN KENRICK.

Pæonia moutan Banksæ, a fine specimen, (from a plant that has stood out during winter with scarcely any protection), from Mr. WILLIAM KENRICK, Newton.

A beautiful bouquet of Flowers, containing the following varieties, viz. Nerium splendens, Rhododendron ponticum, Diosma alba, Celsia cretica, Calceolaria corymbosa; a species of Allium very fragrant; Roses, Tulips, Lilacs, Geraniums, Stock Gillyflowers, &c. &c. from Mr. THOMAS MASON, Charlestown.

Lupinus, Pollyphillus (a splendid variety), Hesperis matronalis var. alba and purpurea, Scotch broom (*Spartium scoparium*), Pæonia tenuifolia and Polygonatum multiflorum, from the Lancaster Garden, by G. C. BARRETT, Esq.

24 splendid varieties of the Geranium, 'Roses, Stocks, Calceolaria corymbosa, &c. presented by Messrs. HOVEYS from Mr. SWEETSER, Cambridgeport; Amaryllis formosissima, from Messrs. HOVEYS.

For the Committee,

CHAS. M. HOVEY.

We hope that the friends to improvement in horticulture will come forward, as the season advances, and be emulous in displays of all the flowers and fruits, which our soil and climate are capable of producing. We should be very much mortified if a bud of such promise as the M. H. S. should wither on its stem, in consequence of any neglect in its cultivation. Let us each and all, to the amount of our ability, contribute to sustain the flower and perfect the fruit, of a plant, which has already yielded abundantly, and promises to be worth more than mints of money, or mines of gold to those who will avail themselves of its benefits.—*Ed. N. E. Farmer*.

See Advertisement on page 383.

Prevention of Mildew. Professor Lindley of the London University, lately lecturing on mildew, gave it as his opinion, that the only effectual method of cure which has yet been discovered, is that recommended by Mr. Bauber—namely steeping the seeds before sowing in lime water for twelve hours and then drying them in the air.—*Mechanic's Mag.*

From the Genesee Farmer.

RUTA BAGA AND MANGEL WURTZEL.

As I have cultivated these roots more or less every season for the last twenty years, I suppose a short account of my practice may be acceptable to such as are now commencing.

Three times ploughing, with a harrowing and rolling after each, puts the ground in complete order to receive the seed of the ruta бага, which should be sown immediately after the last ploughing—the longer time the ground lays between each ploughing the better, so that the grass and weeds don't grow large, say not less than a month.

The time of sowing may vary according to circumstances and convenience—any time from the first to the end of the seventh month (July), will do for ruta бага in this latitude. If I wanted the roots for table use I should not think of sowing before the middle of the month—if for cattle, it might do to sow the beginning; but I may remark that most of the failures I have noticed have been in consequence of too early sowing on land not well prepared; for, though turnips do not require a very rich soil, it should be perfectly mellow, and every particle of grass or perennial weeds ought to be entirely dead before the seed is sown. Thus the hoeing and weeding is performed with far less labor than would otherwise be required, and the roots will grow quick—this they must do to be sound and well flavored.

I have usually put on about six or eight two horse loads of dung previous to the first or second ploughing, as most convenient. This, however, is not necessary if the ground is naturally rich, or has been in grass for some time.

The method of sowing in rows is the best, in my opinion. I have tried various distances for the rows from two to four feet—the former is decidedly too close, and the latter distance may be thought too wide; but I have found the bulk of crop greater on four feet space than on two feet—at any rate I think it a positive loss of labor to sow closer than three feet. This leaves room for a cultivator to pass between the rows. The plants should be thinned so as to leave only one in a foot; it is important that this should be done as soon as the plants are large enough to resist the attacks of the turnip fly. The crop will be much diminished if this is not attended to, especially when vegetation is rapid. One pound of seed is amply sufficient for an acre if sown in rows—if broad cast, the same or rather less will suffice, on account of the increased difficulty of hoeing and thinning.

The common English turnip I consider but a very poor root to cultivate for cattle; but if managed as above directed for ruta бага, except to sow the seed two or three weeks later, very heavy crops could be raised; but I think mangel wurtzel is the most valuable root for cattle. It is a trifle more expensive to raise it—requires to be sown about a month earlier than ruta бага—is not so easily preserved through the winter, and requires rather a richer soil. On the other hand, it thrives best on soils too heavy for the turnip—the bulk of crop is greater—it can be sown to advantage after once ploughing, and is never eaten by insects as turnips are. Thus being a very certain crop, it received the name of root of scarcity, meaning, I suppose, that it never failed in times of general scarcity. Cattle, sheep and hogs, prefer it to any other root that I have ever seen, after they become used to it. Two pounds of seed will suffice for an acre, in rows three or four feet apart. I

have always been sensible of a loss of time and labor, when I have planted this crop closer than four feet by fifteen inches from one plant to another. It is a gross feeder, and I believe no soil can be too rich for it, but it will amply repay the labor bestowed on it. I have raised them weighing twenty-five pounds each, and I believe there was one of these roots exhibited in London weighing 42 pounds.

Lastly, I may just say how I proceed with the work of sowing the seed, which, for each kind, does not vary much—having no drilling machine, I get a piece of plank or slab six feet long, more or less, according to the distance I intend to have the rows—saw out three blunt teeth, one at each end and one in the middle—put a long handle in the centre, and draw this thing over the ground crossways of the last ploughing, letting one outside tooth go in the last marked row, thus making two rows every time. To expedite the sowing, I moisten the seed a little, and add a little lime or some white substance. This makes it easy to see how thick I sow it, and enables me by going at a quick step, to put in several acres in a day if required.

J. S.

Ouasco, 5 mo. 7, 1834.

From the Northern Farmer.

ROLLERS—SOWING GRASS SEED.

FARMERS who are in the practice of using Rollers to level and smooth the ground, are fully convinced of their great utility. How inconvenient it is to mow, when the surface is very uneven, or where small rocks lie upon it. And there is a loss of labor in being obliged frequently to grind the scythe, or in case of breaking to get a new one. In laying down the soil to grass in the spring, the roller makes "smooth work," and drives down the pebble stones and small rocks beneath the surface, and also renders the appearance of the fields more delightful. But the use of the roller is very beneficial in sowing grass seed. The harrow unless made with very fine and very short teeth, ought not to be used; because the grass seed, which the common harrow buries one, two or three inches beneath the surface does not vegetate. In sowing grass seed, I now use only the roller, and it "catches in" much better than it does by harrowing it in. After a light gravelly soil has been well ploughed and harrowed, it may often do very well to sow the grass seed upon the surface before a rain. This fact, perhaps well known to many I learned by accident. I directed my hands to lay down a field with rye and grass seed. But they forgot to sow the grass seed, as I learned after the rye had sprouted. Believing that the use of the harrow would then destroy the rye, I scattered the grass seed upon the surface and never had any catch in better. But there were several rains soon after. This experiment has induced me to use only the roller.

To make a roller some take a log, others a stone hewed round. Either is much better than none; but they often drag the small stones, &c. forward, instead of beating the same down perpendicularly into the ground.

A roller made of old truck or cart wheels is preferable. My men made one of a pair of old truck wheels in the following manner. A two-inch white oak plank was cut into short pieces, one end of each piece resting on the hub, and the other end projecting about half an inch above the felloes by wooden pins. A heavy axletree was then put

in, about seven feet in length, the ends projecting out of the hubs about five or six inches. The wheels were next covered with narrow thick pine plank, and spiked into the ends of the white oak plank.—But the planks must be hewed, so as to form a perfect circle, previous to driving the spikes.

The planks which cover the machine, must not only be very narrow, but thick, the edges being hewn obliquely, being well jointed, resting upon and supporting each other, and therefore capable of resisting a great external pressure. Narrow white oak plank, or small timbers are then to be formed in the shape of an oblong square. In the centre of the sides of this frame, a square hole is cut so that the ends of the axletree may enter, and in this frame the roller revolves. To the front end of this frame the tongue or spire is attached, so that the machine may be drawn with horses or oxen. Many farmers now use rollers of a similar construction. Should it be desirable to pick rocks while operating with the machine, it would be easy to construct a box to be attached to the frame. The strength of the roller may be increased, by nailing iron hoops round the outside. I think that large are preferable to small wheels. In order to turn the machine with the cattle with greater ease, it may be judicious to have the circumference in the middle a little larger than at the ends. But when the middle rests upon rising ground, or a little hillock in the act of turning, there is no great difficulty.

Many farmers suffer their cattle, in the wet seasons of Spring and Fall, to graze in their mowing fields. By this practice the soil is not only beaten down and rendered uneven, counteracting the good effects of the roller, but the grass roots are much injured, and, by the fall seeding are indeed more liable to be winter killed. It is a practice which ought to be discontinued. The inevitable consequence of it is, either to reduce, or else prevent the increase of the quantity of hay.

W. CLAGGETT.

Portsmouth, March 24, 1834.

From Hayward's Science of Agriculture.

ON HAYMAKING.

HAVING observed that in a season when there was no rain whatever, and the hay had been made with rapidity, and carted within a short time after it had been cut, that a greater quantity was destroyed and injured, by being overheated and burnt, than in a catching irregular season; that when hay had not heated in the stack, it was frequently mouldy; that as hay lost its native green color, and approached a brown, it lost its nutritive qualities; and that altogether the making of hay, as usually conducted, was a very precarious and teasing operation: I determined on trying to arrange a system on some more regular and certain principles, in which I succeeded; and by adopting a certain and regular course of operations, was enabled to make my hay of a uniform good quality; and, let the weather be as it might, at a regular expense of labor. And considering such a process not only of importance, as it ensures a more perfect quality; but as it affords a more certain protection against the injuries usually consequent on the uncertainty of the weather, and overheating in the stack; and that it thus removes two great causes of anxiety, it may be well worth the public attention.

In the first place as to the state of the weather, it generally happens at this season of the

year that there are three or four days rain and three or four days dry; therefore on beginning to cut the grass, as it is well known that during wet weather grass may be cut, and suffered to remain in the sward for several days without injury; and it being desirable, where hands are plenty, to have a good quantity, or so much as will complete a stack in a day, in the same state of forwardness; I should prefer beginning to cut during the rainy weather: however be this as it may, the swards should not be opened but on a certain fine day; and when this is done the grass should be well shaken apart and equally spread over the ground. As soon as the upper surface is dry, turn it well over; and in this operation great care should be taken to open and spread any cocks that may not have been divided in the first opening. This being done, commence raking into wind-rows, in time that the whole may be made into small cocks before night. *The second day these cocks must remain untouched; let the weather be wet or dry:* the third day, if the weather be certain and fine, throw the cocks open; but if the weather be wet or threatening, they may remain another day, or until the weather is certain to be fine for the day. The cocks should then be thrown, according to the crop, into beds of two or three rows; and after three or four hours exposure, turned over; and taking time to gather the whole into wind-rows and cocks before night, let this operation commence accordingly, *and none be left open:* the day after this, which in fine weather will be the fourth; *the cocks must again remain untouched, or not be opened, whether the weather be wet or dry.* On the fifth or next day, these cocks will only require to be opened for an hour or two, when they will be fit for the stack. The novelty of this mode consists only in suffering the hay to remain in the cock the second and third or alternate days; and at first sight it may appear that so much time in fine weather must be lost, but this is not the case. Whilst the hay remains in cocks, a slight fermentation, or what is termed sweating, will take place, and in consequence, after it has been opened on the third and fifth days, it will prove to be just as forward as if it had been worked every day. And the advantages resulting from this, are obviously the following; by shortening the time of open exposure, the color of the hay is more perfectly preserved, and consequently the quality: and the fermentations or sweatings which take place in the cocks, prove so much to have diminished that principle, or inclination to prevent its heating injuriously in the stack; and the whole operation of making, whether it takes four days or eight, requires three days labor only; and the hay being left in that state every night, in which it is the least possibly exposed to the injuries of the weather, and in which it may remain for a day or two in uncertain weather, without injurious exposure; much painful anxiety, and useless attendance of laborers are obviated.

TO PREVENT BEER FROM BECOMING ACETOUS.

THERE is a way to prevent beer from getting acetous, or what is called hard, which is as simple as it is efficacious. Reasoning on the plain principles of chemical science, we were led to try it, and have this summer found its truth and advantage. It is nothing more than to suspend a knob of marble by a piece of tape from the bung hole to near the bottom of the barrel, upon which, being

pure carbonate of lime, the acid quality of the beer acts on its incipient formation: it consequently becomes neutralized, and thus is kept from turning hard or sour. In our experiment the marble was considerably eaten away, except where the tape encircled, and the beer remained sound and fresh to the last drop. We mention this discovery as being a point of some consequence to householders, and especially to farmers and their laborers in harvest time; for it is more likely that weak beer should become sour than strong; it is much more healthy to drink it fresh than ever so little turned off, and, in the way of economy, many barrels might be saved, which are every year thrown into the hog-tub from becoming undrinkable. It will do good, however, to every species of beer, and, we expect, to any kind of home-made or even foreign wines in cask, which have or are likely to become tart or sour.—*Oxford Jour.*

From the Genesee Farmer.

CURRENT WINE.

BEING lately on a visit to one of my friends in a neighboring town, I was regaled by him with some currant wine of his own manufacture. It was so very excellent that I requested him to make known to me the process of making it—it was as follows:

Take eight or ten gallons of currant juice, to which add ninety pounds of common brown, or one hundred pounds of molasses sugar—put them into a brass kettle, which hang over a moderate fire—stir them up together well, and carefully take off all the scum which rises to the top. Particular care must be taken that the fire is not so great as to make the juice boil, no more heat is necessary than to cause the impurities contained in the sugar to rise so as to be skimmed off. When the liquor becomes pure, pour it into a clean firm barrel—then fill up the barrel with clean water, and let it stand (in the cellar) with the bung out to ferment. Let the fermentation continue as long as it will. The cask must be filled up frequently with sweetened water. When the fermentation ceases, bung up the barrel tight, the process of manufacturing the article is ended.

My friend assured me that he could by his currants, manufacture his wine, for 37½ cents per gallon, and that he had frequently sold it at one dollar per gallon.

Many a farmer has currants, which might in this way be made use of to great advantage; and those who have not, might, in little time, and with little trouble, furnish themselves with an ample supply.

W. P. W.

Milton, March 22, 1833.

☞ We do not pretend to know, never having tried the process, what advantage there may be in heating the juice and sugar. But we do know, having practised it for a number of years, without a single failure occurring, that the above proportions of currant juice, sugar and water, (without being simmered over a fire, but otherwise managed as above,) will make a clear, good, strong wine. We should have supposed, that heating the juice would have a tendency to loosen the fermentation, and therefore prove injurious.

Our plan has been to carefully strain the juice through a flannel cloth; and to completely dissolve the sugar before putting it in the barrel. By frequent mashing and stirring the sugar, light impurities will rise to the top and heavy ones sink to the bottom, the first of which we skimmed off and the

second left in the bottom of the vessel. If care is taken to keep the barrel filled up during the fermentation, "the scum which would rise to the top" by heating, will be thrown out by the fermentation.—Experience has convinced us, that it is best when making to have as much of the mixture over filling the barrel, as will keep it filled up during the fermentation. The vessel ought to be filled up two or three times a day.—*Ed. Franklin Repository.*

NATIVE GRAPE.

ALL New England abounds in the wild purple grape, some vines of which are very prolific, and some appear to be always barren. This grape has seldom been used for any purpose, except to be pickled while green, or eat when ripe; but we have the best evidence that it may be turned to account, in the manufacture of a very delicious wine. We have not the slightest doubt that the vine may be cultivated so as to yield a thousand fold more than now, of larger and finer fruit, and the product will be abundant of almost any flavored wine the manufacturer may choose: the pure juice lightly expressed, and somewhat sweetened with sugar, will furnish a wine of a most excellent flavor, similar in color and taste to a Frontignac or Muscat; and the quality may be changed by a stronger expression of the astringent quality of the skins, until the wine will, in that respect, run through all the varieties of Claret port, still retaining, however, much of the Muscat flavor.—*Lowell Jour.*

COMPARATIVE VALUE OF DIFFERENT KINDS OF FIREWOOD.

THE table at large shows the weight of a cord of different woods, seasoned, the quantity of charcoal each will make, and other valuable information—founded on experiments. It assumes as a standard the shellbark hickory.

| | lbs. in a cord. | Comp. value. |
|--|-----------------|--------------|
| 1 Shellbark Hickory, | 4469 | 100 \$7 40 |
| 15 Buttonwood, | 2391 | 52 3 85 |
| 15 Maple, | 2668 | 54 4 00 |
| 11 Black Birch, | 3115 | 63 4 67 |
| 17 White Birch, | 2369 | 48 3 56 |
| 10 White Beech, | 3236 | 65 4 81 |
| 4 White Ash, | 3450 | 77 5 70 |
| 2 Pignut, Hickory or } common Walnut, } | 4241 | 95 7 03 |
| 18 Pitch Pine, | 1904 | 43 3 18 |
| 19 White Pine, | 1868 | 42 3 11 |
| 20 Lombardy Poplar, | 1774 | 40 2 96 |
| 7 Appletree, | 3115 | 70 5 18 |
| 3 White Oak, | 3821 | 81 6 00 |
| 9 Black Oak, | 3102 | 66 4 89 |
| 6 Scrub Oak, | 3339 | 73 5 40 |
| 16 Spanish Oak, | 2449 | 52 3 85 |
| 12 Yellow Oak, | 2919 | 60 4 44 |
| 8 Red Oak, | 3254 | 69 5 11 |
| 13 White Elm, | 2592 | 58 4 29 |
| 5 Swamp Whortleberry, | 3361 | 73 5 40 |

So much for the purchaser—and now a word to the seller.

It is estimated that a cord of wood contains when green 1443lbs. of water. So that a farmer who brings into market a cord of green wood, has no less load for his team, than another who should put on the top of his cord of dry white oak, *three quarters of a cord of seasoned pine, or one hog-head and two barrels of water.*—*Brown's Sylva Americana.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JUNE 4, 1834.

FARMER'S WORK.

Ruta Baga. We have frequently described the modes of cultivating this plant, adopted by our best farmers. We will, however, add some particulars with regard to its culture and uses, which may be of service to some of our readers.

Arthur Young, in his *Farmer's Calendar*, has the following remarks:

"The inducements to enter freely into the culture of the Swedish turnip are many and important. 1. If he has the right stock of seed, the root yellow in flesh and rough in coat, it lasts [in England] through all frosts, and may be depended on for sheep quite through the month of April, though drawn two months before, and spread on a grass field. 2. It is an excellent and nourishing food for sheep and also for any sort of cattle. 3. It is equal to potatoes for keeping stock swine; a point of great consequence. 4. It is next to carrots the best food which can be given to horses. 5. It is sown at a season, which leaves ample time in case of a failure to put in common turnips or cabbages. All these are powerful inducements to urge a farmer to enter readily into their culture."

For the mode of cultivating the ruta бага, see Rev. Henry Colman's account of his method in obtaining a crop for which he received a premium of \$20 from the Mass. Agr. Society, *New Eng. Farmer*, vol. ix, p. 284, and Judge Buel's statement *N. E. Farmer*, vol. xi, p. 277, and page 380 of this day's paper.

Hoeed Crops. The oftener you stir the ground among corn, potatoes, &c. the less they will suffer from drought. Stirring the ground renders the soil more open and porous, so that it will the more readily receive and retain the dews and rains. Earthing or hilling of plants should be done with caution. Heaping the earth too much about plants is hurtful, as it does not permit the roots to have so much benefit from the rains, and too much hinders the influence of the sun on the lower roots. Whatever hilling is done should be performed by a little at a time, that the roots may gradually and easily accommodate themselves to their change of condition.

Advantages of row-culture, or growing crops in drills.

N. B. Rose, in the *Gardener's Magazine*, observes, "The plan I adopt for growing all garden-crops usually raised from seeds, and not transplanted afterwards, such as turnips, carrots, onions, lettuce, radishes, &c. &c. is to sow them in drills of different degrees of width and depth, according to the size of the seeds and of the plants produced. As soon as they rise through the ground I commence thinning and hoeing, repeating the operation several times, especially the hoeing between the rows. The advantage of frequently stirring the ground about plants is known; but it may not be obvious to every one that the soil can be stirred much deeper, when the hoe works along a continued straight line, as it does between rows, than it can be when it works in curves or irregular roundish spaces of limited extent, as it does among crops sown broad cast. I sow my onions in rows six inches apart, and I can stir between them to the depth of nine inches or a foot if I choose; but if they were sown broad cast, and every plant six inches from every other, I could not stir between

them, with a common hoe, deeper than one or two inches.

Stirring deep and frequently renders watering unnecessary, because a porous surface is less impervious to the heat of the sun than a solid one, and therefore keeps the ground beneath both cooler and moister. Any gardener, who doubts this being the case, may convince himself of the fact by covering part of a bed of onions with three inches of rotten tan, and comparing the soil beneath the tan with that left bare, as to heat and dryness."

Tobacco for destroying Insects. **Thos. McLaurin** in the *Gardener's Magazine*, has the following observations: "I procure from the tobaccoists, liquor expressed from tobacco, to every gallon of which I add five gallons of water; this mixture, with Reed's Garden Syringe I sprinkle over trees and plants infested with insects, putting it on the finest rose, and being careful to wet all the leaves; this operation is performed only in the hottest sunshine, as the effect is then much greater than when the weather is dull. In this manner I have with five gallons of liquor, reduced as above stated, cleaned seventeen peach and nectarine trees, twelve of which average twelve feet in height. The black glutinous insect, provincially called blight, so destructive to cherry trees in the same way with equal facility. I have also found, upon trial, that the grubs, which attack the apricot may be instantly destroyed by immersing the leaves infested in this liquor.

"This is the cheapest and most expeditious manner of destroying the above insects, which has come within my knowledge, and to those who have not seen the operation performed the effect produced is almost incredible. Roses, and in fact, any plant liable to be infested with green fly, and situated where tobacco smoke cannot be used with effect, may be easily cleaned by dipping in or sprinkling with tobacco liquor, as circumstances may render most convenient.

"When trees have got so bad that their leaves are much curled, some of the flies being protected within the curl, will escape; in this case more force must be applied to the syringe, and in a day or two the trees should be looked over again, and whatever part of the leaves has not been wetted, should be washed with a painter's brush; but a careful person will render this process unnecessary, by taking them in time."

Preservation of Seeds. The late M. Zea, the Peruvian Botanist, asserted that the most delicate seeds of American plants may be sent to Europe in the highest preservation, by being enveloped in that kind of raw brown sugar, which always retains its humidity. When the seeds are to be sown it is only necessary to immerse them in lukewarm water, which will take off the sugar.—*Horticultural Register*.

Thinning Plants. Do not permit too many melon or cucumber vines to remain in a hill. Some experienced gardeners have asserted that the hills of water melons should be planted 8 feet apart, and musk melons 4 feet apart each way. And when the plants have become too large to be destroyed by bugs they should be thinned, so as to leave but one in a hill. Cucumbers should be left but little nearer together than musk melons.

Insects in Salads. To be sure that you eat no insects with your salad and greens, you may wash them first with salt water, and then rinse them with fresh water.

ITEMS OF ECONOMY, &c.

Burns and Toothache. Cotton applied to burns works wonders; if difficult to keep in its place, moisten it with a little sweet oil or molasses. It is equally good to allay the burning pain of limbs that have been frost bitten. For toothache, attended with swelling, put as much as convenient in contact with the affected part of the jaw, both in and outside the mouth.

The Common Strawberry is a natural dentifrice, and its juice without any preparation dissolves tartareous incrustations on the teeth and makes the breath smell sweet and agreeable.—*Bangor Courier*.

Murrain.—A draught of alum and sulphur has been found a remedy for bloody murrain arising from cattle's swallowing leeches.

Cure for Bolls. I send you a remedy I used while our coals were brought to market in road wagons, which obliged us to use a great number of horses; and I never knew it fail of giving relief in one to five minutes, viz: Pour half a gill of spirit of turpentine into the hand, rub it on to the breast of the horse while suffering; let it be applied to the hollow or pit of the stomach, just at the point where the neck joins the breast, on a space six to eight inches in diameter. The relief is certain, if the grubs have not already cut through the coats of the stomach.—*Farmer's Register*.

Mixture for Cattle and Sheep. It has been recommended, by a gentleman who tried it, to mix salt with unleached wood ashes, in the proportion of one quart of fine salt to one half bushel of ashes, and place the mixture under cover, where the animals can have access to it. This composition, our informant said, preserves the health of the animals, increases their appetite, and he believed would preserve sheep against the rot, and horses against bolls.

To make a sick Horse drink freely.—A horse has a very sweet tooth—when he is unwell and won't drink, mix molasses or coarse brown sugar in the water; he will then drink freely.—*Old Colony Whig*.

ITEMS OF INTELLIGENCE.

It has quite a melancholy influence upon the feelings, and produces reveries of a grand but painful nature, to visit the country, which surrounds this borough, and behold the richness of its budding beauty blasted, and withered beneath the destructive influence of the frosts which have fallen upon it. The grapes, apples, peaches, pears are all injured, if not destroyed; the corn and potatoes are cut off; and the forest trees, which a few days ago were putting forth their leaves in that richness and loveliness which makes the heart throb joyfully, and turns the thoughts in cheerful channel "from nature, up to nature's God," are seared and blasted. They still turn the thoughts "from nature up to nature's God," but in sad and melancholy mood.—*Penn. Republican*, of May 21st.

Fifteen houses were destroyed by fire in the city of New York, on Thursday afternoon. Most of them were of wood, and they were occupied by forty families chiefly foreigners.—*N. Y. paper*.

Carelessness. On Saturday last, as Mr. Levi Marston was standing at the window of his house, in Portsmouth, N. H. with a child about six months old in his arms, a bullet discharged from a rifle on the opposite side of the mill pond, struck the child on the side of the head, near the top, and tore off a large piece of the scalp. Mr. Marston's own life was spared by mere chance. The mischief was caused by some idle fellows, who were firing at a mark in the neighborhood.—*N. H. Gazette*.

At Huntsville, in Alabama, there has been experienced a more severe frost, and greater damages have been done by it, than has ever before been known in the country. The whole of North Alabama has been affected by it, and it is feared that the entire cotton country has sustained serious injury.—*Ibid.*

A New Continent. The N. Y. Journal of Commerce has an extract from the Hobart's-town paper, giving an account of the discovery of a large body of land, somewhere to the southward of the Cape of Good Hope, the particulars of which have, they say long been a desideratum. Such of our readers as may wish a full account of the Voyage of Discovery, during which this land was first seen, taken from the "Log book of the brig Juba, commanded by Mr. John Brisbane, R. N." may find it in the Journal of the Royal Geographical Society of London, vol. the third, 1833, first part.

Colony of Pigeons. A Susquehannah, (Pa.) Co. paper mentions that immense numbers of Pigeons have taken possession of, and appropriated to their use, a territory said to be nine miles in length, and two miles in width; every foot of which, and almost every tree and branch of a tree upon it, are constantly occupied by them. It is presumable that the beech woods are indebted for this pigeon visit, to the abundant crop of beech nuts produced the last season; by which they are abundantly supplied with food.

The King of Sweden has become a temperance man, and designs to limit the working of distilleries in his dominions to six months in the year.

Rail Roads in England. There are now building in England what they term "The great Western Rail Road," which is to connect London and Bristol. Another is building between London and Southampton; another from London to Greenwich; another from London to Birmingham; another from Hull to Shelby; and the Northern Union Rail Road.

VALUABLE NEW WORK ON AGRICULTURE.

This day Published, by GEO. C. BARRETT, at the Office of the N. E. Farmer,—The

COMPLETE FARMER and RURAL ECONOMIST,
By THOS. G. FESSENDEN, Esq.

Containing a compendious epitome of the most important branches of Agriculture and Rural Economy, and the following subjects arranged in order:

| | | | |
|--------------|---------|----------------|-----------------|
| Soils, | Wheat, | Beans, | Mangel Wurtzel, |
| Grasses, | Rye, | Swine, | Ruta Baga, |
| Grain, | Oats, | Lime & Gypsum, | Potatoes, |
| Neat Cattle, | Barley, | Fences, | Haymaking, |
| Barns, | Millet, | Hedges, | Ploughing, |
| Dairy, | Hops, | Sheep, | Poultry, |
| Hemp, | Peas, | Horses, | Wood: |
| Flax, | | | |

and to which is added—Descriptions of the most approved Implements and Machines, with Engravings.

The work is printed on the best of paper, and is intended for a Farmer's Directory, which every farmer should be possessed of; and relying upon an extensive sale will be afforded at the low price of \$1.
m 21

[From the New England Magazine of June 1st, 1834.]

All men love a farm and a garden, and Mr. Fessenden is better qualified than any other man in New-England to compose a good work on these practical subjects—albeit he was in his youth addicted to the less profitable pursuits of wit and poetry. This work should be on the shelf of every farmer's library: there is much in it to guide him and nothing to lead him astray. All is practical, nothing is speculative. It embraces the entire transactions of a farm. The materials for the work must have been collected through many years. Excellence is comparative—and any traveller in England may there best notice the defects of American husbandry. Still, however, it is with caution that in our soil and climate we should adopt the English modes of cultivation.

The soils are first treated of, then grasses, grain, cattle, animals, dairy, manures, harvesting, poultry, implements, &c. &c. Those who would have a choice of implements may choose among many at the New-England Agricultural Warehouse. Here is every facility for saving labor and increasing crops; and the implements that are not useful—if any such there be—are studies of ingenuity. All are made in the best manner, and they are in some sort an illustration of Mr. Fessenden's book, many being neatly delineated in it.

MASSACHUSETTS HORTICULTURAL SOCIETY.

A stated meeting of this Society, will be held at their Hall, 81 Cornhill, (lately Market Street) on Saturday the 7th day of June, at 10 o'clock.
R. T. PAINE, Rec'g. Sec'y.

CULTIVATOR.

Just received at the Agricultural Warehouse, a few of Seaver's improved expanding CULTIVATORS, for weeding among Corn, Potatoes, &c. &c.
je 4

WILLIS'S IMPROVED STRAW & HAY CUTTER.

For sale at the Agricultural Warehouse 51 and 52 North Market street. The straw or hay cutter is a machine well worth the attention of every farmer, and should be in common use with every farmer feeding stock.

From the great improvement and simplicity of these machines of Willis's, the work is done with great ease and despatch, and requires but one person to operate it, which is not the case with any other machine, every farmer who is disposed to use his fodder to the best advantage and preserve his animals in the best health will in all cases cut their fodder.
my 21

BRASS SYRINGES.

Just received at the Agricultural Warehouse, a good assortment of Willis's improved Brass SYRINGES for Green Houses, Grape Vines, &c. &c.—see Complete Farmer, page 345.
je 4 J. R. NEWELL.

DAHLIAS.

A Collection of fine Double DAHLIAS, started in pots at 50 cents, for sale at the New England Seed Store, 51 & 52 North Market street.
G. C. BARRETT.

ZINC WARE.

Just received, a further supply of Zinc Milk Pans, Kettles and deep Bake Pans, and for sale at the Agricultural Warehouse, No. 51 and 52 North Market Street.

The manufacturers of this article having closed their works, no more of them can be procured at present,—and as the season is at hand when these are most wanted, and as they are found on trial to produce a great increase of Milk, they are highly recommended to the public as one of the improvements of the day.
my 14

FULL BLOOD SHORT HORN HEIFER CALVES FOR SALE.

Four full blood Short Horn Calves for sale from Imported Stock, sire and dams, if application is made in one week to the Publisher of the New England Farmer, he will furnish particulars as to prices, ages, &c.
may 14

HALL'S IMPROVED HAY RAKES.

Just received, and for sale at the Agricultural Warehouse, 50 dozen of the first and second quality of Hall's best warranted Hay Rakes.
my 14

NEW WORK ON FLOWERS.

Just published, the Florist's Manual, with Eighty beautifully colored Engravings, being the best work adapted to American floriculture extant—price \$2.50. GEO. C. BARRETT.

BRIGHTON MARKET.—MONDAY, June 1st, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 230 Beef Cattle, (including 60 unsold last week,) unsold 20; 20 cows and calves, 730 sheep and 130 swine.

PRICES. Beef Cattle—No particular variation from last week. The cattle generally were not so good, but about the same prices were obtained for an equal quality. We quote prime at 6 33 a 6 50; good at 5 88 a 6 25; thin at 4 50 a 5 50.

Cows and Calves.—In demand; we noticed sales at 20, 25, 27, 30, 32, 40, 45, and 50.

Sheep.—Dull—lots were taken at 2 25, 2 50, 2 75 and 3; a lot not sheared were taken at about 4 80.

Swine.—One lot 3 barrows were taken at 64, and one lot all barrows at 64; at retail 64 a 7 for sows, and 74 a 8 for barrows.

GARDEN AND FLOWER SEEDS.

An excellent collection of GARDEN and FLOWER Seeds of very best quality, in papers of 61 cents each, constantly on hand and for sale at New England Seed Store of

GEO. C. BARRETT.

MISCELLANY.

[From Sir Samuel Moreland's Perpetual Almanac, Ready Reckoner, and Gardener, published in the reign of Queen Anne.]

DIRECTIONS RELATING TO THE PURCHASING OF LAND.

First see the land which thou intend'st to buy,
Within the Seller's Title clear to lie;
And that no Woman to it doth lay claim
By Dowry, Jointure, or some other Name
That may it cumber. Know if bound or free
The Tenure stand, and, that, from each Feoffee
It be released; that the Seller be so old,
That he may lawful sell, thou lawful hold:
Have special care that it not Mortgaged be,
Nor be intayled on Posterity.
Then if it Stand in Statute bound or no,
Be well advised what Quit rent out must go,
What Custom service hath been done of old,
By those who formerly the same did hold;
And if a wedded woman put to Sale,
Deal not with her, unless she bring her Male;
Thy bargain being made, and all this done,
Have special care to make thy Charter run
To thee, thy Heirs, Executors, Assigns,
For that beyond thy life securely binds,
These things foreknown and done, you may prevent
Those things Rash Buyers many times repent,
And yet when you have done all that you can,
If you'll be sure, deal with an honest man.

LINES

—Written by the Rt. Hon. George Canning when a young man, and left by him on the table of a young lady on the morning of her marriage. She having a few days before presented him with a piece of plush to make a pair of breeches.

When all on this auspicious day
Well pleased, their grateful homage pay,
And sweetly sing, or softly say,
A thousand civil speeches.
My muse shall spread her trembling wings,
Nor scorn the lay her duty brings,
Tho' humble be the theme she sings,
A pair of shooting breeches.
Soon shall the tailor's subtle art,
Have made them neat, and strong, and smart,
And fortified in every part
With twenty thousand stitches.
Mark then the moral of my song:
O may your love but prove as strong,
And wear as well, and last as long
As these, my shooting breeches.
And when to ease the load of life
Of private care, of public strife,
The gods to me shall grant a wife,
I ask no rank nor riches:
For sense like thine alone I pray—
Temper like thine serene and gay,
One formed like thee to give away,
Not wear herself the breeches.

MARRIAGE.

Look at the great mass of marriages which take place over the whole world; what poor contemptible affairs they are! A few soft looks, a walk, a dance, a squeeze of the hand, a popping of the question, a purchasing of a certain number of yards of white satin, a ring, a clergyman, a stage or two in a hired carriage, a night in a country inn, and the whole matter is over. For five or six weeks two sheepish looking persons are seen dangling on each other's arm, looking at water falls, or making morning calls, and guzzling wine and cakes; then every thing falls into the most monotonous routine. The wife sits on one side of the hearth, the husband on the other, and little quarrels, little pleasures, little cares, and little children,

gradually gather around them. This is what ninety-nine of a hundred find to be the delight of matrimony.

IGNORANCE vs. KNOWLEDGE.

KNOWLEDGE has the wantonness of a child, and the cruelty of an ogre. He builds up systems in one age, only to overturn them in another; he begets theories in one century, and not only exposes them to perish, but is himself the unnatural instrument of their destruction in the next. He resembles Homer's infant on the sea-shore, raising castles of sand with pains and perseverance, then with hands and feet demolishing its labors; or he may be likened still better to Titan, devouring as fast as they see the light the offspring of his own loins. Now turn we to Ignorance and what do we behold? Not content with evincing the tenderness of a parent, by defending like a lion, his own notions and opinions whenever they are attacked; he rushes forward with disinterested courage to the succor of systems and theories with the procreation of which he had nothing in the world to do, the moment he sees them deserted by their natural protectors, and in danger of being annihilated by the ruffian Improvement, or that shocking desperado Reform. This promptitude to espouse the weak, is extremely amiable in Ignorance. Let him but see a principle in any science, astronomy, geology, anatomy, metaphysics or politics, no matter how philosophical its pedigree, in danger of being roughly handled by what is called the march of intelligence, or the extension of experience; in other words hustled by a knot of ill-looking facts, like a foot passenger in Oxford street by a gang of pickpockets, Ignorance at once cries, "to the rescue!"—makes common cause with the doctrine in distress—knocks down one fact with a flat contradiction—floors another with a shout—puts a third "hors du combat" with a horse laugh, and by this chivalrous conduct not unfrequently extricates its friend, and gives some useful error, or venerable prejudice a new lease of its existence. But in the catalogue of the vices of Knowledge, although there be many blacker, there is none so contemptible as his curiosity. Ignorance it must be allowed by his best friends, is in some few particulars rather more inquisitive than becomes his dignity; he is sometimes too anxious to discover what his next door neighbor is to have for dinner; or how many thousand pounds the old lady on the other side of the street has got in the Three per Cents; or what business the gentleman who lives six houses higher up, has with the fat man in a green coat and pink cravat, who knocks at his door every day, except Wednesdays, at five minutes past two precisely; but what of this?—It is only in downright trifles that any body can justly tax ignorance with curiosity—when was he ever known to meddle with the great secrets of the world? When for instance was he ever caught like the elder Pliny, peeping into the crater of a volcano? Never; he leaves such low tricks to those Paul Prys, cycloped philosophers. He would have remained in the dark forever as to the laws of electricity, before he would have stooped to the mean artifice of Dr. Franklin, who, on pretence of flying a kite, insinuated himself into the confidence of a thunder cloud, made himself acquainted with all its private affairs, and then (to crown his baseness) published them to the whole world. Nature never leaves her wardrobe, or a drawer of one of her scrutoires unlocked, but these dirty fellows

your men of science, take advantage of the oversight to tumble her dresses, read her family papers, and often purloin her trinkets for their cabinets and museums. What are mineralogists but a gang of thieves, who have discovered the secret springs of the chest, in which Nature keeps her treasures? What are phrenologists but pick locks, who actually boast of having in their possession a key to the whole mystery of the human mind? The mathematician you swear is about nothing handsome, he is generally to be found in angles and corners. The astronomer waylays nature by night; the botanist in wild and sequestered places—

"In wood or grove, by mossy fountain side,
In valley or green meadow;"

wherever, in fact she is likeliest to be found asleep or undressed. Who then can doubt the purity of the intentions with which he pursues his cryptogamias and syngenesias? No question, Apollo's pursuit of Daphne was nothing in the world but a botanical excursion;—divinity only wanted to ascertain the nymph's class and order. Then what have the conchologists and entomologists to say for themselves? The elders in the apocryphal legend Heaven knows were filthy old fellows enough; but their obscenity was chastity compared to the conduct of these men of periwinkles and butterflies; they did not put on their spectacles—at least it is not so written—to contemplate the bathing beauty; they were content to stare at Susannah's charms with the naked eye. Not so the entomologists; not even spectacles are enough for them; they must actually have microscopes or they see nothing.—*Metropolitan Magazine.*

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,
1 Case wet (but not damaged) Bishops Lawn.
1 do. do. do. Book Muslin.
Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation. m 14

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table matts. istf. a 16.

COMPLETE SET OF THE FARMER.

One complete set of 11 Volumes of the New England Farmer bound in excellent style. For sale at the Farmer Office. This will be found to make a valuable Library for an Agriculturist.

VOL. XII.

BOSTON, WEDNESDAY EVENING, JUNE 11, 1834.

NO. 48.

From the Portsmouth Journal. **BIRDS.**

It has been the ravenous practice of man to destroy all those beautiful creatures—and the more beautiful, the more furious he is to destroy them, and that too without the least gain.

Now can we be candid enough to consider the evil consequences of this practice, as well as the great benefits to be derived in forbearance of such a practice? It is my present intention to set forth some of the evils resulting from such brutal and inhuman practices, and to endeavor to bring to view some of the benefits unavoidably resulting from their discontinuance.

It is a melancholy fact in this vicinity, and probably elsewhere, at least as far as the extent of the New England States, that our songsters, who give the most delightful of all melody, are so extinct, that in our usual walks of business or of pleasure it is rare to hear or see a solitary one, especially one of those admired songsters the *navis* or *mock* bird that is so distinguished above all others of the bird tribe,—especially to see her so bold as formerly, rise to the top of a high tree, determined that every note should be distinctly heard, and there for fifteen minutes in succession, without the least intermission never repeat a single note; as soon as her song is ended, she is sure to remove to another of the loftiest tops and pitch another song in as clear and deliberate a manner as any of the human tribe possibly can. Now the poor songster, if she presumes to show her head, or sing us one of her old hundreds, even in a bush, she is immediately put to death.

The singing of birds in general, is above all music particularly at the closing of our long frozen winters, after being long shut up and excluded from most of the enlivening exhibitions of nature. The sight of a variety, and of plenty of those birds with their warbling voices around us in our walks, and in our business, would change the present melancholy scene very much. It is surprising that we notice the very great difference within a few years; I could once see a tolerable number of different species in my orchard, and about my farm; but men as they call themselves, and boys, would flock around my dwellings, and in dry seasons, when there was much danger of fire being kindled from their guns. Every bird of every description, was shot on its nest, or off, no matter, if a bunch of birds could be obtained to carry home for a show. I am not troubled with those gunners now; there are no birds on my farm save barn swallows, and a pair of Pewees, who are sure to come home every season, and breed in an out-building undisturbed.—We endeavor to protect them from guns and stones. They are as tame as we wish them; and they take off a few of the insects that infest our eyes and ears.

Besides the privation named of the sight and music of those birds, we are sensible of a great increase of insects that infest our fruit trees, and that prey upon our grain and corn fields. We may positively assert, that if birds were increased a thousand to one, hopping over our grounds in search for their food, that there would be a great diminution of those insects amounting to nearly total extinction. There are many that feed on the

insects on fruit trees, which if undisturbed, from a common course of nature, would free them from these pests which ruin the fruit. The different species of Woodpeckers used to be plenty, which are now almost extinct, from their exposed state, in searching out fruit orchards. The Cuckoo is a fine but rare bird; she exposes herself from singing her very melodious songs; also from the circumstance of her particular manner of living, which I believe is wholly on caterpillars. I have seen them light at a new nest and clear it completely.

There are many species of birds which I have not mentioned as to their beauty and usefulness, and some few that are mischievous. My design has been to show that we once were delighted with, and benefitted by those birds, and that we are now living in this dreary land, without their company, and without their great benefit. And now I will show that if we choose, we can soon enjoy their company again.

The remedy is practicable, it is only to legislate in their favor. To make the thing more perfect, every State should go hand in hand. A heavy fine should be laid against those who destroy any birds, except the most mischievous.

MANGEL WURTZEL FOR CATTLE.

By the Editor of the American Farmer.

LAST year we made an experiment with mangel wurtzel for cattle, and the result was highly satisfactory—so much so that we shall hereafter adopt it in preference to all other root crops for the purpose. Having about the sixth of an acre of ground prepared for early corn for which we had not seed enough, we determined to plant it in mangel wurtzel as an experiment, having very little confidence in its equality with ruta baga. We accordingly soaked the seed twenty-four hours in warm water, laid off furrows about two feet apart, and dropped the seed six or eight inches apart, covering it as we do corn. When the plants were up, we passed over the field with a weeding hoe, and subsequently run a small plough through it twice, clearing out the weeds with a hoe. This is all the cultivation it had, and we feel certain that all the work bestowed upon it, including the original preparation of the ground for corn, did not amount to more than two full days work for one man. We put no manure on the ground, though it had been manured the year before for potatoes, and for planting in early York cabbages, which were killed by the severity of the winter. The soil was a fair medium mold, a mixture of sand, clay and vegetable matter; high ground, but level. When the mangel wurtzel was gathered, it was estimated by every one at seventy-five bushels; some more, but none less. It was also perfectly evident that we might have taken at least one-fourth more, if not double the quantity, from the same ground, had we planted more carefully, and laid the rows fifteen or eighteen inches apart, instead of two feet. There were many places in the rows where there was not a plant for six or eight feet; and then again many places where they were so crowded that the roots could not fairly develop themselves.

As food for cattle, especially for milch cows, our

experiment was as follows: In October our best milch cow began to fail in her milk, and we cut an arm full of the tops of mangel wurtzel for her; this seemed to have a good effect, and it was repeated night and morning for a week, when she fully recovered her usual supply. The leaves were then withheld, and she immediately failed again in her milk. At that time her full quantity was about twelve quarts a day, and when the mangel wurtzel leaves were withheld, the quantity she gave was only about six quarts. She had a good pasture, with an excellent stream of water in it, and plenty of salt during the time; but at that season the grass does not afford sufficient nutritive matter.

After another week we began giving her the roots of the mangel wurtzel, cut small, and occasionally sprinkled with shorts or corn meal, and a little salt; one peck of the roots given thus, had the same effect on her milk that the tops had; and we suspended these a week, to try their effect the more certainly. The result was as above stated, a conviction that mangel wurtzel is the best and most profitable root we can raise for milch cows.

After cutting off the leaves, they very soon grow out again, so that they may be cut every fortnight. But we think it better to select the largest roots from crowded places, and give them tops and all; as we think the new growth of leaves is at the expense of the roots.

FRUIT TREES.

DR. THATCHER gives the practice of an intelligent cultivator, in pruning young trees in the nursery, which we consider very judicious:

"Mr. Cooper remarks that the side shoots should not be cut close to the stem, as the whole growth is thereby forced to the top, which becomes so weighty as to bend and spoil the tree. A better method is to cut the ends of the side shoots, which will encourage the growth of the trunk, until it acquires strength to support a good top. The side shoots may then be cut close. In forming the top Mr. C. has found it necessary to lighten the east and northeast sides, as fruit trees generally incline that way; and to encourage the branches on the opposite quarters, to keep the sun from the trunk; otherwise the rays of that luminary, when striking nearly at right angles, will kill the bark, bring on canker, and ruin the tree."

Professor Lindley says that transplanted trees "should not be headed down the first year, nor will they require to be headed down afterwards, in such trees whose growth is upright; but such as are of a pendant growth should remain till they are well established in the ground; and may then be headed down." In giving directions for the treatment of dwarf trees, he also says "they should not be cut down when planted, but should stand a year, and then be headed down."—*Genesee Farmer.*

To render Fruit Trees productive.—If the ground is richly cultivated for crops, the trees will grow thriftily, but will ripen but a little fruit. After they have acquired a sufficient size, the ground should be laid down to grass, or, when more convenient, a wide walk should be made over their roots.—*American Gard. Mag.*

From the Southern Agriculturist.

ON THE MANAGEMENT OF HORSES WHILST TRAVELLING.

As it is your request, I will now endeavor to say something about the treatment of a horse upon a journey, though, I assure you, that you have travelled much more than I have. I will however, say how I would treat my nags.

It is of great importance that the horse be in good condition before the journey is commenced, not very fat; he should eat nothing but the most solid food for sometime before you start, nothing light or green, for nine out of ten horses will founder if fed on green food. Early in the morning give a few swallows of water for some horses will not eat without, particularly if feverish at night. Give three quarts of corn soon after the water; he should not be limited in fodder, but let him have it before him from the time he is put up at night till you start. Give him as much water as he will drink before you start, travel very slow for the first hour, for many horses are foundered from the body becoming suddenly hot when full of cold water, just as when the reverse happens filling the body with cold water when it is hot. Give about a gallon of water frequently, for by giving a small quantity often, the stomach is kept more cool, and there is less danger. Twice or three times a day put about a pint of corn meal and a little salt into the water, and stir it well in. Whenever you water on the road, move off the horse immediately, to stand still after drinking is very wrong. When you stop for any time, say for an hour or so, do not water till you are going off. I never give corn during the day—three or four quarts of oats may be given, and fodder or hay, for the quantity he will eat will not injure him. In hot dusty weather it is very gratifying to the horse to wash or wipe the face, and the inside of the nostrils with a sponge and cold water, and if you add a little vinegar it is better; do this at the time of, and before watering. When you stop for the night, let the horse go into a lot to wallow and walk about for half an hour, then let a few bundles of fodder or hay be given to him while he is rubbed, curried and brushed, and afterwards as plentifully as can be given. When cool have his legs washed with soap and cold water, and the feet picked out, and then let him have his fill of water, but without salt. Be careful that the horse always eats some fodder before he gets his corn; give a strong large horse eight quarts of corn at night, or as many ears as are equal to it—it is better to feed on the ear than to shell it, as the horse eats not so fast and will perhaps eat less. If the corn is new give but half the quantity; always give oats in the morning if to be got, six quarts will not injure a horse. If the horse gets galled, wash the parts with strong whiskey and water. If your horse becomes dull and heavy on the journey, or loses his appetite, tie a lump of gum assafetida on his bit, covered or wrapped in a strong rag. This may be continued for the whole journey, and I believe prevents his taking any distemper if put with sick horses, or in stables where they have been: it is also a preventive of founder. Horses sometimes get lame on the road without any apparent cause. It is generally from being improperly shod. There are such various notions as to the treatment of a horse when foundered, that it is difficult to know what to say on the subject. I would bleed freely from the neck—give a pint of whiskey with a little warm water and molasses,

with a lump of alum about the size of a nutmeg dissolved in it, and urge the horse on his journey.

I have now my good sir, said what I would do with my horse on the road, and if any part of it is worth your consideration, you are welcome to it. Hoping that you will excuse great hurry and blunders, and with my best wishes for your having a safe and pleasant time of it,

I remain yours with regard, B.

GREAT EXPLOIT.

On Saturday, a pair of horses before a light wagon, trotted over the Centreville course on Long Island, 100 miles in two minutes less than 10 hours, and, of course, won the bet of 1000 dollars. Is this not unprecedented?—*New York Gazette.*

The *New York Commercial* adds the following particulars relating to this cruel treatment of these fine horses. We agree with the New-York editor that it is a fit subject for the Grand Jury:

It was a match against time by two horses belonging to Mr. R. B. Thiel, of this city, for \$1500, to trot in a light four wheel carriage, one hundred miles in ten successive hours; and was won, having two minutes thirty-five seconds to spare. If what we have heard be correct, the latter part of the match was a scene revolting to humanity. The horses performed wonders the first eighty miles, but evidently flagged the ninth hour, and on the tenth, became so completely worried, that, during a portion of that time, they were whipped with a degree of cruelty unheard of on any course in this country or in Europe. One of the morning papers states that men with whips had to drive them around the last mile, and that there is little hope of the recovery of one of these fine animals—should he even survive, he will never be fit for the road again. We shall be glad to give contradiction to this statement, if it be untrue. If it be true—and we had the story from the lips of a gentleman who was on the course—the authors deserve strong public censure, and it is the duty of the grand jury to indict them.

From the Maine Farmer.

WASHING SHEEP.

THE time of the year has commenced, when, if it is not already done, sheep must soon be washed. Now who does not know how to wash sheep? Aye, but how few there are washed as they should be. Thousands of dollars are lost to Maine annually from neglect in the single operation of washing wool as it ought to be done. The wool merchant always ready and abundantly willing to decry the article, finds that it is not so clean. He accordingly makes an allowance for the dirt, and depend upon it he makes more of an allowance than the real amount of the dirt would warrant.

Hence by the work not being thoroughly accomplished, a loss is sustained; a loss which though it may not amount to much to individuals, yet in the aggregate will swell to a large sum. Most of our farmers use no soap while washing their sheep. Others use so little that it does no good. Now a liberal use of this article would save much money to the community, not only by diminishing the allowance made for extraneous matter in the wool, but in the reputation which would be gained by always having perfectly clean fleeces. Manufacturers complain that although the staple of the wool from Maine is good, it is generally wretchedly cleansed. There is another point in this business which on the score of humanity we

would urge upon our farmers. It is care and tenderness exercised towards the animal during the operation. The work is too often entrusted to thoughtless boys and to others, who having a job to perform feel no interest in the flock and use but little gentleness towards the sheep in their hands. Many sheep receive injuries from the shaking and wrenching and slating about which they are doomed to undergo while in the hands of the washer. After having washed your sheep thoroughly be careful where you put them, if you would not lose your labor entirely. A clean smooth pasture free from sandy places, old decaying stumps, or burnt logs, should be the place for them to run in till shearing time. Many who in fact are careful in washing, are careless in this particular, and thereby lose nearly the whole of their labor. The sheep lie down in the sand, or they rub against the stumps, &c., and in a few minutes fill their fleeces with a load of dust or sand. We repeat, more care in this business will save the State much money, and not only this, but retrieve the reputation of our flocks.

FRAUD IN WOOL.

THE practice of rolling up a quantity of pulled wool, tag-locks, and filth in fleeces, has become so prevalent of late in many of the wool-growing districts, that it is proper at this time, when shearing is near at hand, to caution those who are about to purchase wool of the farmers, to examine critically the condition in which the wool is put up, and whenever fraud is discovered, the severest penalty the law will permit, should be inflicted on the perpetrator. Instances have occurred where nearly a fourth part of the weight of what was supposed to be purely fleece wool, has proved to be something of an entirely different character. Many extensive manufacturers have declared it as their determination not to purchase wool at any rate unless it is in good condition.—*Courier.*

From the Genesee Farmer.

SLIGHT COLDS.

I NOTICED in the *Pennsylvanian* of May 10, some remarks on a slight cold. This subject is certainly important, and the nostrums too often resorted to in such cases, tend more to create serious complaints than to cure. The neglect of mismanagement of these slight colds are often the means of inducing consumption, inflammation of the lungs, and other incurable disorders. We have often heard of molasses and rum, of hoarhound candy, and other nostrums. Now it is obvious that what we call a slight cold, is a stoppage of the imperceptible evacuation by the skin, and all stimulants or astringents are hurtful. To restore this tendency to the surface, is the main object, and I know nothing better than to take a tea-spoonful of ipecacuanha—pour on to it about a gill of warm but not hot water—take one tea-spoonful of this tea three or four times a day, keeping in the mouth a small piece of saltpetre about as large as a pea and swallow the spittle—this will cure in most cases.

Medicus.

To temper Large Instruments.—W. H. Raiford, in the *Southern Planter*, says, some wrought iron ploughs will last twice as long as others. This is owing, in a great measure, to the tempering. It is in vain, he says, to attempt to temper large instruments in a small quantity of impure water. The more and the purer the water the better will be the temper.

ALTERNATE HUSBANDRY

—Has been a principal means of converting one of the poorest counties of England, the county of Norfolk, into one of the most productive and wealthy. Most of this county possesses a sandy soil. Sixty years ago summer fallows, according to Young, were common there, and fields were left in grass three years. At the close of the last century, according to the same writer, no such things as summer fallows were known, and grass was left but two years. The number of horses was lessened; ploughings were not so frequent, often but one for barley; and some trusted to scarifying, and succeeded well. This change of system had the effect to increase the product one quarter and one third. The same system is coming into operation upon our sandy soils, and with equal if not greater advantages.—*The Cultivator*.

PEAS.

Those who would sow peas for seed, and who wish to raise them free from bugs, should consult the climate, and watch the time when the pea bugs deposit their eggs, note the time necessary for peas, after sowing, to arrive at that stage when bugs could deposit their eggs in the young fruit, and defer sowing until it shall be too late to have them injured.

In this vicinity, by sowing the Marrowfat about the tenth of June, and the Blue some eight or ten days earlier, they will not be injured.

Where peas are designed for feeding hogs in autumn, they should be sown early, as by that course the crop is greater than when sown late, as above, and the ground may be prepared earlier for wheat. The egg which is deposited in the young pea, does not injure it for feeding to stock in the fall.—*Goodsell's Farmer*.

AN EXPERIMENT ON OATS.

HAVING sown the same oats for several years without changing the seed, my crops became fuller and fuller every year of the black dust head or blast, until the loss from this cause, amounted to one half the crop: and when thrashed out, the black dust was so suffocating that the laborers were made sick by it. I determined in 1832 to change the seed, and got one hundred bushels of the purest seed that could be procured in Richmond; they did not quite hold out to sow all the land intended, and I had to use some of my own impure seed—which I washed effectually in very strong lime water, and allowed them to remain in the lime water the night before sowing. It proved an effectual remedy; the product was decidedly more clean on harvesting than that from the seed procured in Richmond, although that was tolerably pure.—*Farmer's Register*.

CORN.

One of the most important improvements, introduced by scientific farmers in the culture of this very important crop, within a few years, is the planting of from four to six times the usual quantity of seed; and, at the first hoeing, pulling up all but the proper number of plants, leaving the best and most thrifty ones to form the future crop. Experiment has shown the great advantages resulting from this course, if confidence is to be placed in the reports of our most successful farmers, upon this subject; or if science and the laws of analogy are to be trusted in this, as well as in other cases. Every farmer must have seen the difference in the size, appearance and thrift of the

corn-plants, in the same hill. What farmer would undertake to breed indifferently from a healthy, or a sickly race of animals? Why not apply the same principle to vegetable productions?

The additional quantity of seed, recommended in the culture of this crop, the expense of which is but trifling, enables the husbandman to select the healthy plants only, for the crop, removing all the sickly ones: and with them, the danger, if any exists, of communicating disease to such as remain. Within a few days, an intelligent farmer who had seen the experiment tried, expressed to us the fullest belief, that this improvement in planting had added one fourth, to the quantity and value of his crop.—*Northern Farmer*.

NEW WAY TO CATCH FISH.

We were much pleased with a story told us the other day, respecting the method sometimes adopted to catch trouts in the lakes in the back part of this State. A steel trap is taken and a piece of pork is tied upon the plate, the trap set and lowered down in the water. His troutship, who is not always eager to bite, but often prefers smelling and nibbling a little before he makes the fatal grab, comes up to reconnoitre, and while according to his custom he is turning the pork over with his nose, he springs the trap upon himself and is drawn up nabbed like an unlucky rat, by his head and shoulders.—*Maine Farmer*.

NEW MODE OF GROWING ONIONS.

AFTER the beds are formed and the seed planted in rows, in the usual way, the spaces between the rows are covered with strips of board of such width as will leave from two to two and a half inches between them for the rows. These boards are suffered to remain until the growth of the onion is considerably advanced, and until it begins to bottom; when they are removed and laid up for another year. This covering prevents the growth of weeds; keeps the ground from becoming too dry or too wet; screens it from the cold night air, and is said greatly to promote the growth of plants, as well as to save much labor in keeping down the weeds. If the boards are whitewashed, they will permit less heat to pass off during the night.—*Northern Farmer*.

Chickweed.—Some farmers have said that if they could cover up the open spaces in their fields which occur between their crops, with boards, they would want no other manure. Now if this opinion be adopted, it may follow that although chickweed abstracts some nourishment from the soil, yet its leaves and stems, acting in lieu of the boards, may completely counterbalance that loss.—*G. Farmer*.

Rochester, N. Y. The young men of Rochester have had Temperance meetings in all the wards of that Village. Young men in every part of the union can greatly advance the cause by setting themselves zealously to work.

MASS. HORTICULTURAL SOCIETY.

A STATED meeting of the Mass. Hort. Society was held at their rooms, No. 81 Cornhill, on Saturday, June 7th, the Vice President presiding.

The Secretary being absent, Chas. M. Hovey was chosen Secretary pro tem.

The Chairman of the committee chosen at a former meeting to take into consideration the expediency of the Society's having a public exhibition

of fruits and flowers in the ensuing autumn, made a report, and offered the following resolution, which was adopted:

Resolved, That the Committee appointed at a former meeting to take into consideration the propriety of a public exhibition the ensuing autumn, be authorized to proceed with the same if it shall appear to them practicable; and in case the receipts shall fall short of the amount of expenses attending the same, the deficiency shall be reimbursed from the funds of the Society.

Voted, That a committee be chosen for the purpose of carrying into execution the above resolution.

Messrs. Geo. W. Pratt, J. P. Bradlee, Wm. E. Payne, J. G. Joy, Jona. Winship, David Haggerston, Samuel Walker, Dr. S. A. Shurtleff, Thos. Mason, Chas. Senior, R. L. Emmons, C. M. Hovey, Wm. Kenrick, were appointed the committee.

Voted, That the Secretary be authorized to notify the chairman of the said committee of his election, with a copy of the resolution passed at this meeting, and requesting a meeting of the committee at the rooms of the society on Saturday the 14th inst.

Messrs. Wm. T. Andrews and Lorenzo Prouty of Boston, and Frederic Hayden of Lincoln were admitted Subscription Members.

The following letter was received from H. J. Finn, Esq. of Newport, R. I.

Boston, June 7th, 1834.

Dear Sir—In reply to your polite communication, which honors me with the title of "Corresponding Member of the Massachusetts Horticultural Society," I request that you will present my best acknowledgments to the President and Directors of the Institution; and assure them, that as far as my humble efforts and example may extend, they shall be exerted to promote the interests of that Science, which may date its present powerful influence from the formation of the Society, and the practical superiority of its distinguished members.

With sentiments of great respect for them, and personal regard for yourself, I remain, your obliged friend,

HENRY J. FINN.

Z. Cook, Jun. Esq.

Adjourned to Saturday, June 14th, at 11 o'clock, A. M.

CHAS. M. HOVEY,

Secretary pro tem.

EXHIBITED.

Pæonia moutan Bankse (or tree *Pæony*), from Hon. Jona. Hunnewell, Roxbury.

Pæonia moutan Bankse, *P. rosea*, Scotch roses, &c. from Mr. Wm. Kenrick.

Azalea nudiflora, and *flammea*, *Pæonia moutan Bankse* and *aristina*, Early white Italian Honey-suckle (*Lonicera caprifolium album*), *Magnolia cordata* and Scotch roses, from Mr. John Kenrick, Newton.

A bouquet of Flowers, consisting of Roses, Geraniums, &c. from Mr. Thomas Mason, Charlestown.

Pæonia officinalis rubra, and Guilder Roses (*Viburnum opulus*), from Messrs. Hovey.

For the Committee, CHAS. M. HOVEY.

A handsome specimen of the Mackay Sweeting Apple, in good preservation, was presented by Capt. Mackay of Weston.

For the Committee, E. VOSE.

From the Penny Magazine.

THE LOCUST.

THE locust belongs to that class of insects which naturalists distinguish by the name of *gryllus*. The common grasshopper is of this genus, and in its general appearance resembles the "migratory locust," of which we have to speak. The body of this insect is long in proportion to its size, and is defended on the back by a strong corslet, either of a greenish or light brown hue. The head which is vertical, is very large, and furnished with two antennæ of about an inch in length; the eyes are very prominent, dark, and rolling; the jaws are strong and terminate in three incisive teeth, the sharp points of which traverse each other like scissors. The insect is furnished with four wings, of which the exterior pair, which are properly cases to the true wings, are tough, straight and larger than those which they cover, which are pliant, reticulated, nearly transparent, and fold up in the manner of a fan. The four anterior legs are of middling size, and of great use in climbing and feeding, but the posterior pair are much larger, and longer, and of such strength that the locust is enabled by their means to leap more than two hundred times the length of its own body, which is usually from two to three inches. Locusts, as the writer of this article has seen them in the East, are generally of a light brown or stone color, with dusky spots on the corslet and wing cases; the mouth and inside of the thighs tinged with blue, and the wings with green, blue, or red. These wings are of a delicate and beautiful texture; and in the fine fibres by which the transparency is traversed, the Moslems of western Asia fancy that they can decypher an Arabic sentence which signifies "We are the destroying army of God."

The female locust lays about forty eggs, which in appearance are not unlike oat-grains, but smaller. She covers them with a viscid matter, by which they are sometimes attached to blades of grass, but are more usually deposited in the ground. For this purpose she prefers light sandy earths, and will not leave the eggs in contact with moist or cultivated grounds, unless she has been brought down on them by rain, wind or fatigue, and rendered incapable of seeking a more eligible situation. Having performed this, the female dies; and the eggs remain in the ground throughout the winter. If much rain occurs, the wet spoils them by destroying the viscid matter in which they are enveloped, and which is essential to their preservation. Heat also seems necessary to their production, for the little worm which proceeds from the egg, sometimes appears so early as February, and sometimes not until May, according to the state of the season. This, in the usual course becomes a nymph, in which state it attains its full growth in about twenty-four days. After having for a few days abstained from food, it then bursts its skin, comes forth a perfect animal, and immediately begins to unfold and trim its wings with the hinder feet. The insects which first attain this state do not immediately fly off, but wait in the neighborhood for those whose development is more tardy; but when their army is formed they take their flight from the district.

To those who have not seen a flight of locusts, it is difficult by description to convey an idea of the appearance it presents. As seen approaching in the distance it resembles a vast opaque cloud, and as it advances a clattering noise is heard, which is occasioned by the agitation and concus-

sion of wings in their close phalanxes. When they arrive they fill the air, like flakes of thick falling snow; and we have known the bright and clear sky of Chaldea, become darker than that of London on some heavy November day.

Wherever they alight every vegetable substance disappears with inconceivable rapidity before them. The most beautiful and highly cultivated lands assume the appearance of a desert, and the trees stand stripped of all their leaves as in the midst of winter. After devouring the fruits, the herbage, and the leaves of trees, they attack the buds and the bark, and do not even spare the thatch of the houses. The most poisonous, caustic, or bitter plants, as well as the juicy and nutritive, are equally consumed; and thus "the land is as the Garden of Eden before them, and behind them a desolate wilderness." It seems as if nothing could appease their devouring hunger, and the energy and activity they exhibit, and the rapidity of their operations, almost exceed belief. Their depredations are not confined to the open air; they scale the walls, and penetrate to the granaries and houses. They swarm from the cellar to the garret, and within doors, and without, they are a terrible nuisance, for they are continually springing about, and often, in consequence, give a person startling raps, on different parts of the face, affording very sensible evidence of the force with which they leap; and as the mouth cannot be opened without the danger of receiving a locust, it is impossible to converse or eat with comfort. When they have settled themselves at night, the ground is covered with them to a vast extent; and in some situations, they lie one above another several inches thick. In travelling they are crushed beneath the feet of the horses; and the animals are so terribly annoyed by the bouncing against them in all directions of the insects they have disturbed, that they snort with alarm, and become unwilling to proceed.

It is not merely the living presence of these insects which is terrible, but new calamities are occasioned by their death, when the decomposition of their bodies fills the air with pestilential miasma, occasioning epidemic maladies, the ravages of which are compared to those of the plague. Thus famine and death follow in their train; and instances are not of rare occurrence in the East, in which villages and whole districts have been depopulated by them.

Under these circumstances it necessarily becomes an object of anxious attention, in the countries they are most accustomed to visit, either to prevent them from alighting on the cultivated grounds, or to drive them off or destroy them after they have descended.

The impression is very general that noise frightens these insect devastators, and prevents them from alighting. When therefore, the people are aware of the approach of their armies, every kettle or other noisy instrument in the place is in requisition, with which, and by shouts and screeches, men, women, and children unite in the endeavor to make the most horrible din in their power. The scene would be truly laughable, from the earnestness which every one exhibits in this strange employment, were not all disposition to mirth checked by the consciousness of the fearful consequences of the invasion which it is thus endeavored to avert.

How far noise may really operate in preventing their descent in ordinary circumstances, it is not

easy to ascertain; but on the approach of evening, or when exhausted by their journey, nothing can prevent them from alighting. They will then descend even on the seas and rivers, of which some striking instances are recorded.

When a swarm has actually alighted, the means employed to drive them off, are much the same as those to prevent their descent. But this is never attempted in wet weather, or until the sun has absorbed the dew, as the locust is quite incapable of flying while its wings are wet. When the swarm is large, or when it has come down on cultivated grounds, no measure of destruction is practicable without sacrificing the produce; but when the depredators have been driven to waste grounds or happened in the first instance to descend upon them, various modes of extirpation are resorted to, of which the following is most effective: a large trench is dug from three to four feet wide, and about the same depth; the off-side is lined with people furnished with sticks and brooms, while others form a semi-circle, which encloses the extremities of the trench and the troop of locusts, which are then driven into the grave intended for them by the clamorous noise already described. The party stationed on the other side push back such insects as attempt to escape at the edges, crush them with their sticks and brooms, and throw in the earth upon them.

These insect devastators have fortunately a great number of enemies. Birds, lizards, hogs, foxes, and even frogs, devour a great number; a high wind, a cold rain, or a tempest destroys millions of them. In the East they are used as an article of food. In some parts they are dried and pounded, and a sort of bread is made, which is of much utility in bad harvests. They are sold as common eatables in the Bazaar of Bagdad, and the cooks of the East have various ways of preparing them for use.

SOOT DESTROYS CUT WORMS.

Soot destroys or drives off from all plants of the cabbage tribe, from pinks, and from other plants, those common and voracious grubs of gardens, the larvæ of the moths of the family Noctuidæ. After being annoyed almost to despair, by the ravages of this grub, I resorted to the use of soot, and thus applied it:—I laid it dry, and near an inch thick over the ground, and had it dug in.—The plants were then planted from 20 to 25 in a row, and so effectual was the soot that instead of losing eight or ten plants in one row, as I before had done, I think I did not lose more than that number in a bed of 200 or 300. In the grub's attacks on plants of the cabbage family, its habit is to eat some nearly and others quite asunder, a little below the heart: it often greatly annoys the farmers in their turnip fields. I have made use of the same remedy, since and have never found it to fail. Last summer I was troubled with the grub in a bed of pinks; I then made some soot water, and watered the bed well, and the bed was soon freed from the grubs. The precise mode of the soot's action on the grubs I cannot state: but I believe that the ammoniacal matter which it contains destroys some and disperses the remainder. I have not found the soot injure the soil at all; and I name this because I had been told it would.—*Farmer and Mechanic.*

Three Important Things.—The three things most difficult are—to keep a secret, to forget an injury, and to make good use of leisure.

MANGOLD WURTZEL OR FIELD BEET.

We are happy to find that farmers are awake to the cultivation of this crop; and so great has been the increase of demand for seed, that it has been impossible at all times to procure a supply. We have already had calls for ten times as much as was called for the last season, and all who cultivated it the last season are anxious to increase the quantity this. One farmer who has been longest in the cultivation of it, is putting in sixteen acres—and speaks of it as the most profitable crop he has ever cultivated.—*Goodsell's Farmer.*

PROGRESS AND EFFECT OF THE SEASON.

The frost about the middle of May destroyed most of our fruit. The forests have not yet recovered, and many trees look as brown, and dry, as if they had been girdled.

The week past has been very warm, and the Curculio, that enemy of all stone fruit in this country, has made its appearance, and wherever a plum or cherry escaped the frost, these little insects are sure to find them, and at once insert into them the seed of destruction. With all their industry, we think some of them will be disappointed in finding a proper place for depositing their eggs, which may diminish their numbers another year.—*Ibid.*

ROTATION OF CROPS IN PENNSYLVANIA.

A FARMER gives, in the Farmer's Reporter, a concise view of the mode of Agriculture in Pennsylvania. The corn is always planted on sward ground, carefully ploughed once, two or three weeks before time of planting. It is well harrowed without disturbing the sod; marked off into furrows three feet apart, in which the corn is planted in hills, one and a half or two feet apart. A little plaster is sprinkled on the hills when well up—barrowed and ploughed once—when too thick, the stalks are thinned. By this method, "we now raise," says the writer, "forty to sixty bushels of corn to the acre, where twelve or fifteen years ago, it was thought a crop of corn could not be obtained at all."

The next crop is oats, sown the succeeding spring. Wheat succeeds the oats, when barnyard manure is carted on. A rye crop follows the wheat. Cloverseed is sown on the rye in March. The clover is allowed to remain two or three years, and plastered; when the same rotation commences again.—*N. Y. Farmer.*

THE SHEEP—HEEDLESSNESS.

Cows and sheep possess much less of the instinctive apprehension of danger than horses. In a marshy country it is by no means uncommon for cows to be bemired, or *laired* as it is termed in the northern counties; and this is still more common with sheep, though so much lighter in weight.

In mountainous and rocky districts, the sheep is by no means to be trusted in places of danger, having none or little of the instinct which enables the goat and the chamois to make their way amongst the steepest precipices. It is remarkable that even upon seeing accidents befall their fellows they are not deterred from following heedlessly in the same track. The heedlessness of the animals in such cases, may probably arise from their being so much accustomed to follow others in the same track,—(a habit which causes a sheep grazing district to be every where intersected with sheep paths about a foot in breadth,)—and when the leader falls over a precipice, the next follows in the same way, as Suwarrow's Russians marched into a trench till it was filled with their dead bodies.—*Penny Magazine.*

MORUS MULTICAULIS.

A SUBSCRIBER asks our opinion concerning this tree as a hedge plant. We answer confidently that it will not answer for a hedge. Cattle are extremely fond of it, and would soon "eat up the fence" if made of so delicious a material. Its extraordinary value as food for silk-worms begins to be understood. Compared with the white mulberry, it will become fit for use 50 per cent. sooner, will yield 50 per cent. more food for the worm, and of a quality 33 to 50 per cent. better at the same time.—*Baltimore Farmer.*

VEGETABLE SILK.

THERE is at present considerable activity in a new branch of industry at Paris. We allude to the manufacture of carpets, and various other articles of general use, from a substance first imported into France by M. Pavy, to which he has given the name of vegetable silk. This substance has, in fact, an appearance very similar to silk, and can be employed as its substitute in a variety of cases. It is white, and can receive dye of any color. This vegetable is gathered in shoots of from 15 to 20 feet in length, and is of such strength that four of these shoots plaited together, will bear a weight of 40 pounds.

A GOLD TERRAPIN.

A GENTLEMAN from Booker's Gold Mine reports that he saw a small gold terrapin, taken from the mine, for which the proprietor refused the respectable sum of five hundred dollars, intending to send it to Peale's Museum in Philadelphia. The little creature was not much larger than a partridge's egg, and ran briskly about, from which circumstance it could not be solid gold, whatever its appearance may have been. Experienced miners report to have seen leather thongs that had been suspended in mines, coated with metallic silver. Another case is reported of a similar coating of the wooden supports left in a mine, which had been under water two hundred years. From such observations, we may infer that silver is sometimes in a gaseous state, and so gold may be; and in that way this curious little terrapin may have got its coating of precious metal. The extraordinary price offered for this non-descript will no doubt lead to its careful preservation.—*Lynchburg Virginian.*

CROCODILE BIRD....From Heroditus.

Now as the crocodile lives much in the water, he has his mouth within quite covered with leeches. All other birds and beasts shun the crocodile; but there is peace between him and the trochilus, inasmuch as he is benefitted by that bird; for when the crocodile goes out from the water upon the land and opens his jaws, which he is wont to do, in order to receive the cool breeze, the trochilus then entering his mouth devours the leeches; and he, delighted at the advantage he thus receives, never injures the trochilus.

TEMPERANCE IN NEW YORK.

It appears from the Report of the Executive Committee of the New York City Temperance Society, made at the meeting held on Friday evening last, that the number of individuals who have signed the pledge within the last year, ending Feb. 25th, amounts to 15,873—to which add 14,471, being the result of previous efforts, and the whole number who have pledged themselves to total abstinence is 30,345 in the City of New York.

ITEMS OF ECONOMY, &c.

Agriculture—says Sir John Sinclair, though in general capable of being reduced to simple principles, yet requires, on the whole, a greater variety of knowledge than any other art.

Salt and lime are said to be very useful for destroying slugs, snails and grubs which infest garden and other plants. For this purpose quick lime should be sown with salt when there is a prospect of a continuance of dry weather. The mixture also operates as excellent manure.

Charcoal sown on the top of the earth, and mixed with it, is stated to be very useful where onions are to be raised. It will protect them from insects and increase the amount of the crop. The charcoal dust is also said to prevent cabbages from becoming club rooted,—and it will increase the warmth of cold soils.

Manner of making Castor Oil very palatable to Children.—Take the quantity of oil you purpose for the dose, and boil it for a few minutes in an equal quantity of milk; then sweeten it with a little sugar. When the mixture has cooled, stir it well, and give it to the child. There will be no necessity of giving the child any thing to drink after taking the mixture, for the taste of it is more pleasant than any drink you can give.

To Wool Growers.—They are particularly requested by the manufacturers not to use cotton twine in doing up the fleeces; the particles of cotton that will inevitably adhere to the wool take a different color, which makes specks in the cloth. Marking sheep with tar of turpentine is also very objectionable.

Curious Fact.—The *Shaddock* contains generally thirty-two seeds, two of which only will reproduce Shaddocks; and these two it is impossible to distinguish; the rest will yield some sweet oranges, others bitter ones, others again forbidden fruit, and in short all the varieties of the orange; but until the trees are actually in bearing, no one can guess what the fruit is likely to prove; and even then the seeds which produce shaddocks, although taken from a tree remarkable for the excellence of its fruits, will frequently yield only such as are scarcely eatable.—*Lewis's Journal.*

Tame Bees.—That bees may be so tamed as not to hurt persons to whom they are accustomed, I have in many instances, heard exemplified, but most remarkably in the following account: A gentleman residing at Bury St. Edmunds, could do with impunity any thing he liked with his bees; he knew every one of them; could distinguish each bee from his fellow, as a shepherd is said to individualize his sheep by the physiognomy of each; and, if he wanted to show a particular bee to a friend, he would have the hive to which it belonged turned out into a cloth, roll the insects about with his hands, like so many peas, and unharmed, select from them the one required! This feat he has often been seen to perform.

One Animal preys on Another.—A large Hake was lately taken on the coast of England in which was found a clever sized Codling. On opening the codling a small Ling was found, sepulchred in his maw. On opening the Ling, an angle worm and several marine insects were found established in close quarters.

The seventeenth year locusts have made their appearance at the South in immense numbers. A letter from Forsyth county, Georgia, says they cover the country in "countless millions," and their noise is perfectly deafening. They are so numerous that the swine have fattened on them.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JUNE 11, 1834.

FARMER'S WORK.

Wood Ashes for Manure. Wood ashes are not only a valuable manure, but an excellent antidote to worms and other insects. They should, therefore, be used for plants liable to suffer by worms, bugs, &c.; such plants for instance as cabbages, turnips, cucumbers, melons, peas, &c. Deane observed that "a handful of ashes laid about the roots of a hill of Indian corn, is good to quicken its vegetation. But it should not much if any of it be in contact with the stalks. The best time for giving corn this dressing, is thought to be just before the second or third hoeing: But some do it before the first, and even before the plants are up. Like other top dressings, it is of most service when applied at the time when the plants need the greatest quantity of nourishment. This happens, in Indian corn, at the time when the plants are just a going to send out ears, or spindles." Ashes, however, will have the better effect in preventing worms if laid on before the plant is up.

Ashes in their full strength are, no doubt, best for manure; and they lose some of their value as manure unless they are kept dry; besides, if they are damp they adhere together, and it is not easy to spread them properly. Dr. Deane observed that "ashes should not be spread on land long before there are roots to be nourished by them, lest the rains rob them of their salts, by washing them into hollows, or sinking them to too great a depth in the soil. A few bushels on an acre are a good dressing for grass lands, that are low, and inclining to be mossy. But ashes from which *lie* has been drawn have no small degree of virtue in them. The earthy particles are but little diminished; and some of the saline particles remain in them, especially in *soaper's* waste, which has lime mixed with it."

Leached ashes are much used on Long Island as manure. From a paper in the first vol. of *New York Agr. Soc. Trans.* by M. E. L. Hommidieu, it appears that "ashes were found to succeed best on dry loamy lands, or loam mixed with sand. It is considered as the cheapest manure that can be procured. Ten loads of this manure, on poor land will produce ordinarily twenty-five bushels of wheat. The land is then left in a state for yielding a crop of hay of between two, and two and a half tons, to the acre, which it will continue to do for a great number of years. No manure continues so long in the ground as ashes."

A writer for the *New England Farmer*, from Catskill, N. Y. observed that "The use of wood ashes, when applied on a light but warm loam, (though many are not acquainted with its worth) will repay the first year three times their cost, in the rearing of a crop of turnips. Let the ground be well ploughed in the spring, once at least more before sowing the turnips, twice would be better. After the last ploughing, which should be immediately before the seed is sown, spread on an acre from 50 to 100 bushels of leached or unleached ashes; then harrow down the furrows, sow the seed and give the ground a thorough harrowing [and pass it over with a good heavy roller]. After the turnips are up, and the third leaf formed, give a dressing of plaster. One hoeing will pay well. Pursuing this method for the last seven years, I have not failed of a good crop, any one year."

J. Spicer, a writer for *Goodsell's Farmer*, recommends the application of plaster and leached ashes as follows:

"From my own experience, I am much in favor of plaster. I use from three to five tons yearly; and when I apply it to corn, which I have done for three years past, I use it with one half leached ashes as they are leached for common family use; put it in a cart, and shovel and mix it well. I then put one gill to the hill immediately after the first hoeing. I have tried the same quantity of clear plaster, side and side, twice, and find the mixture to produce the greatest effects. The two ingredients, when mixed, appear to produce a much greater power of attraction. My neighbors tried it last season, to great satisfaction, and will hereafter use them mixed, even if the cost were the same."

Another writer for the same paper, with the signature "R. M. W." says "A very general prejudice exists among farmers against leached ashes for manure. Vast bodies of them are suffered to go waste or lie idle in every direction about the country. I know by experience that they are excellent manure. I have tried them in my garden, and likewise in field culture, and always with satisfactory results. They are brought in vessels from Albany, Philadelphia, Baltimore, Boston and New York, and deposited at the landing, on Long Island, sold at from 12 to 25 cents per bushel, carted from six to ten miles, and used as manure by the farmers of Long Island.

"About twenty-five years ago I was on a visit to an uncle, and saw him receive four dollars for fourteen bushels of leached ashes. I remarked that the man could never hope to see his money again by spreading them on his land. He replied, *I know not how it is, but we grow rich by it.* I know many thousand acres of land on the Island, which are now producing fine crops of grass and grain, which were formerly too poor to produce any thing but *sorrel* and *mullen*. These have principally been made fertile by means of leached ashes, at this enormous cost of money and labor; and I am much at a loss to know why they are considered worthless among us, while they are in such request on the Island. They should be spread on the soil, and intimately mixed by the plough, or used in compost. In either way, I believe they would be found equally useful to us."

Dr. Deane's description of the soil to which wood ashes may be properly applied as manure is entirely different from the soil to which ashes are recommended by the other writers above quoted. Dr. Deane advised their application to *low and moist land*; and we believe they have generally been so applied in New England. But they are successfully used on Long Island as an application to "*dry loamy lands, or loam mixed with sand.*" Sir John Sinclair observes that wood ashes "are peculiarly well adapted for *gravelly soils and loams.*" Perhaps it is owing to the *mis-application* of this manure that the opinion prevails in some parts of New England that leached ashes ultimately leave the land cold and lifeless, and almost incapable of resuscitation. "Wood ashes consist principally of the vegetable alkali united to carbonic acid; and as the alkali is found in almost all plants it may be an essential constituent in the organs of the greater part. *The vegetable alkali has a strong attraction for water.*"* Ashes then have an attraction for

* *Treatise on Soils and Manures*, appended to the Philadelphia edition of *Davy's Agricultural Chemistry*.

moisture, and if applied to a soil naturally wet must increase its defects and diminish its fertility.

From the *Rohway Advertiser*.

NEW INVENTION.

We have examined the drawing of a machine to gather grain as it stands in the field without cutting. It is called the Locomotive Thresher, intended to be moved by horse power, and with the assistance of three men or boys of fifteen years of age, is calculated to go over ten acres of wheat or other grain per day, and gather say two hundred bushels, leaving the straw standing on the ground threshed as clean as is generally done in the ordinary way, thereby saving all the expense of harvesting; and by ploughing in or burning the straw, it is supposed the ground may be tilled *ad infinitum* without diminishing its fertility. Should this invention succeed, it will afford another inducement for farmers to inhabit and cultivate those beautiful prairies which abound in the far West. The ingenious inventor is Mr. John T. Vail, of La Porte, Indiana, formerly of this town.

Bones of the Mammoth.—We learn that in excavating a water passage in New Britain a few days since, a joint of the back bone of the Mammoth was dug up by the workmen. Further searches are making, and new discoveries are expected to be made.—*Hartford Review*.

ITEMS OF INTELLIGENCE.

Dromedaries. The French are, it is stated, endeavoring to introduce dromedaries from Algiers, into the *Landes* about Toulouse, where it is thought they may be very usefully employed.

Hail Storm. The Greenville Mountaineer states that a most unprecedented hail storm occurred in Spartanburg District, S. C. Some of the hail stones measured 7 and a half inches in circumference.

A New Counterfeit. Counterfeit ten cent pieces are in circulation. The impression of the die is pretty good, but they are said to resemble pewter in appearance and touch, and therefore may readily be distinguished from the real hard money article.—*Balt. Patriot*.

A Virginia paper relates, as a singular fact, that a mule owned by a gentleman near Norfolk, had lately brought forth a colt.

A letter from Manchester, Mississippi, states that 116 deaths from cholera, had taken place upon a plantation six miles from that place.

Important. The Editor of the Geneva Courier has made the important discovery that *hams* should be smoked with the *shanks downwards*! By attending to this, the thick joint of the ham will not become surcharged with oleaginous matter as at present. This must be looked to.

Tornado. The counties of Nottoway, Dinwiddie, and Prince George, Virginia, were visited by a terrific tornado, in the afternoon of the fifth inst which occasioned the loss of many lives, and the destruction of a large amount of property. It appeared in the shape of an inverted cone—its width varying from two hundred yards to half a mile—and the extent of its destructive march is estimated at not less than seventy miles. Every thing which came within its range was more or less injured; and on many plantations, not a single edifice of any description, was left standing. The number of persons killed or wounded in this war of the elements is supposed to exceed fifty.—*O. S. Journal*.

Interesting Fact. A few years ago a very worthy laboring man, in this town, who had been so unfortunate as to acquire a habit of drinking spirit, becoming con-

vinced of its ruinous tendency, had strength of mind sufficient to form an effectual resolution of future abstinence. At that time he had a wooden box made, with a hole in the lid, and labelled "RUM," into which he every day dropped as much money as he had been in the habit of spending for liquor. The box was never opened till very recently, when, on counting the sum, in it was found no less amount than *one hundred and eighty dollars*, with a part of which he purchased a good house lot, and the remainder will go towards putting a neat and comfortable new house upon it. Such examples are above all praise.—*Salem Gazette*.

Baron Hagal, the Austrian botanist, who lately visited the Neilgherry Hills, in India, declares that the unknown varieties of trees and shrubs, existing there alone, exceed 10,000. The wild rose runs up to the top of the highest trees, and grows to the thickness of four or five inches.—A delicious specimen of orange but not exceeding a filbert in size, is also found there. In the orange valley below Kotagherry, about 4500 feet above the level of the sea, numerous fruit trees are found, amongst which are the wild fig and lemon tree, the latter bearing fruit little inferior in size and flavor to that of Spain.

CULTIVATOR.

Just received at the Agricultural Warehouse, a few of Seaver's improved expanding CULTIVATORS, for weeding among Corn, Potatoes, &c. &c. je 4

VALUABLE NEW WORK ON AGRICULTURE.

This day Published, by GEO. C. BARRETT, at the Office of the N. E. Farmer,—The

COMPLETE FARMER and RURAL ECONOMIST,
By THOS. G. FESSENDEN, Esq.

Containing a compendious epitome of the most important branches of Agriculture and Rural Economy, and the following subjects arranged in order:

| | | | |
|--------------|---------|----------------|-----------------|
| Soils, | Wheat, | Beans, | Mangel Wurtzel, |
| Grasses, | Rye, | Swine, | Rota Baga, |
| Grain, | Oats, | Lime & Gypsum, | Potatoes, |
| Neat Cattle, | Barley, | Fences, | Haymaking, |
| Barns, | Millet, | Hedges, | Ploughing, |
| Dairy, | Hops, | Sheep, | Poultry, |
| Hemp, | Peas, | Horses, | Wood: |
| Flax, | | | |

and to which is added—Descriptions of the most approved Implements and Machines, with Engravings.

The work is printed on the best of paper, and is intended for a Farmer's Directory, which every farmer should be possessed of; and relying upon an extensive sale will be afforded at the low price of \$1. m 21

[From the *New England Magazine* of June 1st, 1834.]

All men love a farm and a garden, and Mr. Fessenden is better qualified than any other man in New-England to compose a good work on these practical subjects—albeit he was in his youth addicted to the less profitable pursuits of wit and poetry. This work should be on the shelf of every farmer's library: there is much in it to guide him and nothing to lead him astray. All is practical, nothing is speculative. It embraces the entire transactions of a farm. The materials for the work must have been collected through many years. Excellence is comparative—and any traveller in England may there best notice the defects of American husbandry. Still, however, it is with caution that in our soil and climate we should adopt the English modes of cultivation.

The soils are first treated of, then grasses, grain, cattle, animals, dairy, manures, harvesting, poultry, implements, &c. &c.

Those who would have a choice of implements may choose among many at the New-England Agricultural Warehouse. Here is every facility for saving labor and increasing crops; and the implements that are not useful—if any such there be—are studies of ingenuity. All are made in the best manner, and they are in some sort an illustration of Mr. Fessenden's book, many being neatly delineated in it.

MACHINE FOR CUTTING FODDER.

THE simplicity of the construction of this Machine, and the small probability of its getting out of repair, together with the neat and rapid manner that it performs its work, certainly renders it a desirable article for the purposes for which it is intended. It is constructed on an entire new principle from any heretofore invented, and will cut an hundred weight of hay in ten minutes, two inches long, can also cut any length from three inches to one-fourth of an inch; it is fed by placing the fodder in a hopper that stands perpendicular, the knife playing horizontally underneath, by which means all the complicated machinery for feeding and the power necessary to drive it is avoided.

The Subscriber having become the proprietor of the right of making, &c. said machine, in and for the State of Massachusetts, solicits the public to call and examine for themselves. Said Machine is for sale at the store of PROUTY & MEARS, No. 12 Commercial street, Boston. DAVID P. KING,

Who is also Agent for the States of Vermont, New Hampshire, Maine, and Rhode Island. cow6w a 2.

BRASS SYRINGES.

Just received at the Agricultural Warehouse, a good assortment of Willis's improved Brass SYRINGES for Green Houses, Grape Vines, &c. &c.—see Complete Farmer, page 345. je 4 J. R. NEWELL.

ZINC WARE.

Just received, a further supply of Zinc Milk Pans, Kettles and deep Bake Pans, and for sale at the Agricultural Warehouse, No. 51 and 52 North Market Street.

The manufacturers of this article having closed their works, no more of them can be procured at present,—and as the season is at hand when these are most wanted, and as they are found on trial to produce a great increase of Milk, they are highly recommended to the public as one of the improvements of the day. my 14

FULL BLOOD SHORT HORN HEIFER CALVES FOR SALE.

Four full blood Short Horn Calves for sale from Imported Stock, sire and dams, if application is made in one week to the Publisher of the New England Farmer, he will furnish particulars as to prices, ages, &c. may 14

MANGEL WURTZEL SEED.

300 lbs. Mangel Wurtzel Seed, raised from selected roots and not imported. This article cannot be too highly recommended for Stock, yielding 40 tons to the acre, and being a most profitable crop. Sow 2½ lbs. to the acre. For sale at New England Seed Store. GEO. C. BARRETT.

HALL'S IMPROVED HAY RAKES.

Just received, and for sale at the Agricultural Warehouse, 50 dozen of the first and second quality of Hall's best warranted Hay Rakes. my 14

BOSTON TRUSS MANUFACTORY.

JAMES P. FOSTER, Successor to the late John Beath, at the sign of the Eagle and Truss, No. 338 Washington street. Trusses made to order and fitted to the patient. All sorts of repairing done to Trusses in the best manner.

Among the variety of Trusses made and sold by J. F. Foster, are Patent Elastic Spring Trusses, with Spring Pads—Trusses without steel springs. These give relief in all cases of rupture, and in a large portion produce a perfect cure. They can be worn day and night. Improved Hinge and Pivot Trusses, Umbilical Spring Trusses, and Trusses with ball and socket joints.

Suspensory Trusses for individuals troubled with Hydrocele are always kept on hand, together with all the other kinds made by Mr. Beath, formerly.

The former friends and customers of Mr. Beath are respectfully invited to call as above, where they will be faithfully and personally attended to by Mr. FOSTER. LYDIA BEATH.

N. B. Ladies wishing for either Trusses or Backboards will be waited upon by Mrs. Beath, at her residence, 585 Washington street. L. B.

BOX PLANTS.

From Seven Hundred to One Thousand Yards of Prime BOX in good order for Planting. To be taken up at any time when ordered. Orders may be left with GEO. C. BARRETT, New England Farmer Office, or apply to THOMAS MASON, Charlestown Vineyard. It may be had on fair terms by the Yard or Hundred. m 7

BRIGHTON MARKET.—MONDAY, June 9, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 230 Beef Cattle, 165 of which were from Ohio and Kentucky; (one lot were fed by Henry Clay, not U. S. Senator;) 12 cows and calves, 720 sheep, and 110 small pigs. 50 Beef Cattle remain unsold, all of which are prime.

PRICES. Beef Cattle—The warm weather caused the butchers to hold back, and sales were effected very slow, but at prices nearly equal to last week. We quote prime at 6 17 a 6 37; good at 5 50 a 6; thin at 4 50 a 5 25.

Cows and Calves—We noticed sales at 22, 26, 27, and \$32.

Sheep and Lambs—Lots of lambs were taken with a few old sheep, at 1 75, 2, 2 25, and 2 50; wethers at 3, 3 50 and 3 84.

Swine—Those sold were taken at 2 50 a 4 each. Several contracts for lots were made, which are to be in market next week.

NEW WORK ON FLOWERS.

Just published, the Florist's Manual, with Eighty beautifully colored Engravings, being the best work adapted to American floriculture extant—price \$2.50. GEO. C. BARRETT.

MISCELLANY.

From the Ladies' Magazine.

THE THREE TWILIGHTS.

How glorious is the hour, when first
The world from sleep is waking—
When in the east a few faint rays
Denote that day is breaking!
And then, when from the Ocean's verge
A broader light is gushing,
And brilliantly the sea and sky
With vermil dye are blushing;
When stars withdraw their gentle light,
The moon her brightness veiling,
And, tinged with glory to the south
The clouds of night are sailing;
When birds pour forth their melody
To hail the early dawning,
And all the world doth seem to greet
The twilight of the morning!
When winter days have passed away,
And loosed the ice-locked fountains—
When trees put forth their tender leaves,
And verdure clothes the mountains;
When in the valley or the plain,
The first fresh flowers are springing,
And joyously the lightsome bird
From branch to branch is winging;
When cheerfully along their way
The woodland rills are flowing,
And with a pleasant melody
The western winds are blowing—
How much of gladness fills the world!
How happy every creature!
How doth the twilight of the year,
Bedeck with smiles all nature!
How much the twilight of the year,
And twilight of the morning,
Are like that happy time in life—
Our childhood's early dawning!
When unknown care, and unknown pain,
The heart is free and lightest,
And every hope, and every joy,
And all things shine the brightest!
When all the past hath no regret—
The present void of sorrow—
And not an anxious thought is there
Of what may come tomorrow:
O, well it were if thus through life—
All care and woe at distance,
We could live on, as free as at
The twilight of existence.

From the Southern Agriculturist.

CURE OF BITES OF RATTLESNAKES.

Philadelphia, November 20th, 1834.

FROM my earliest youth, I have been familiar with the account of a negro in South Carolina, having been set free by the Colonial Legislature of that State, as a reward for his discovery of a remedy for a bite of the rattlesnake; but in Carey's American Museum, vol. v, p. 435, the perscriptions of two negroes are given for this object, and one of them adds a remedy for "poison" generally, without specifying whether it be animal, vegetable or mineral. Both these men are reported to have experienced the generosity of the Legislature, by being made free, and by a pecuniary compensation. If such events ever took place it is reasonable to suppose, that a record was made of the occasion in the minutes of the Legislature, and of the grounds upon which their liberality was exercised. Unfortunately no dates are given in the statement in the Museum, but I should suppose that not much trouble would attend the ascertaining the facts in relation to the

subject, and as it is not uninteresting, I take the liberty to suggest the setting on foot an inquiry respecting it. A reference to the books of the Treasurer, might probably lead to the discovery of the year when the rewards, if any, were bestowed, and to all the facts connected therewith. These when ascertained, would form the materials for a useful paper in your work.

I am very respectfully, JAMES MEASE.

"The cure for the bite of a rattlesnake, as discovered by Sampson, a negro; for which discovery, the province of South Carolina purchased his freedom, and allowed him an annuity.

Take Heart Snake-root, both root and leaves two handfuls, Polypody leaves one handful, bruise them in a mortar, press out a spoonful of the juice, and give as soon as possible after the bite; then scarify the wound, and take the root of the herb Avena, bruise it, pour a little rum over it, and apply to the part, over which is to be put the Heart Snake-root and Polypody, which remains after the juice is squeezed out. These medicines and applications must be repeated according to the violence of the symptoms, so as in some dangerous cases it must be given to the quantity of eight spoonfuls in an hour, and the wound dressed two or three times a day.

The above herbs may also be bruised and beat up into a paste with clay, and when necessary may be scraped down to the quantity of half a common spoonful, and given amongst a little rum and water, and repeated as the doses of the juice above mentioned. A little paste may be wet with rum, and rubbed over the wound.

N. B. He always used this method when he could not find the green herb. Sometimes the cure is entirely performed by the patient's chewing the Heart Snake-root, and swallowing the juice, and applying some of the same herb bruised to the wound. When the part is greatly inflamed and swollen, all the herbs in the following list are taken to the quantity of some spoonfuls of each, and boiled into a strong decoction, with which it is to be fomented several times a day.

The herbs presented last by Sampson, are:—1. *Asarum cyclimini folia*, or Heart Snake-root of this province. 2. *Polypodium vulgare*, or common Polypody. 3. *Caryophyllata Virginia radice inodora*, or *Virginia avens*, called here Five fingers. 4. *Loachitis aspera*, or Rough spicewood. 5. *Hypnum julacum*, or small erect Clubmoss. 6. *Gnaphalium humile*, or creeping Goldlocks.

Sampson frequently went about with rattlesnakes in calabashes, and would handle them, put them into his pocket or bosom, and sometimes their heads into his mouth without being bitten. In proof of the efficacy of his medicine, he several times suffered himself to be bitten by the most venomous snakes, and once let his wounds come so near mortification, that it was doubted whether he could recover—yet he cured himself with them; he disarmed any snake of its venom with some one of the herbs. It is said chewing the Heart Snake-root, and spitting the juice upon a snake will instantly kill it."—From an old Almanac, published in 1780, by John Tobler.

The negro Cæsar's cure for poison, for discovering which the Assembly of South Carolina purchased his freedom, and gave him an annuity of one hundred pounds.

1782.—Cæsar's cure for the bite of a rattlesnake. Take of the roots of Plantain or Hoarhound, (in

summer roots and branches together) a sufficient quantity, bruise them in a mortar and squeeze out the juice; of which give as soon as possible, one large spoonful; if the patient is swollen you must force it down his throat; this generally will cure, but if he finds no relief in an hour afterwards, give another spoonful which never has failed. If the roots are dried they must be moistened with a little water. To the wound may be applied a leaf of good tobacco moistened with rum.

For the New England Farmer.

THE TEETH.

MR. EDITOR—An article in the last Farmer says, it has been thought a gargle of vinegar may be useful to clean and preserve the Teeth, being destructive to animalcules, &c.; but I believe any liquid that can remove tartar will affect the enamel. Those teeth which are least used are hardest to keep clean, and not chewing food sufficiently may therefore be one cause of foul teeth.—Rubbing the gums hard with salt and water keeps them in a healthy state; washing frequently behind the ears with cold water is said to prevent the aching, though not the decay of teeth: Hollow teeth are worth preserving when, not having become painful, the decay can be entirely scraped and wiped out and strips of gold leaf crowded in by the dentist's tool. TYP.

GARDEN AND FLOWER SEEDS.

An excellent collection of GARDEN and FLOWER Seeds of very best quality, in papers of 64 cents each, constantly on hand and for sale at New England Seed Store of

GEO. C. BARRETT.

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

1 Case wet (but not damaged) Bishops Lawn.
1 do. do. do. Book Muslin.
Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation. m 14

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table matts. istf. a 16.

COMPLETE SET OF THE FARMER.

One complete set of 11 Volumes of the New England Farmer bound in excellent style. For sale at the Farmer Office. This will be found to make a valuable Library for an Agriculturist.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

PIERCE'S IMPROVED PATENT REVOLVING HORSE RAKE.

For sale at the Agricultural Warehouse, 51 and 52 North Market street, the proprietors of this establishment having the right of disposing of these improved rakes, now offer them for sale, and recommend them to the public as deserving high estimation among the improvements of the day. They are in very general use in Pennsylvania and New Jersey, and are found to rank with the most important labor saving machines now in vogue. One man and horse with this implement will rake on an average from 10 to 12 acres per day.

For the New England Farmer.

ON THE CULTURE OF SILK, AND THE MORUS MULTICAULIS, OR NEW CHINESE MULBERRY.

THE cultivation of the Mulberry tree, for the purposes of silk, is of high antiquity in China. Its history there extends, to 2700 years before the Christian era. From China its cultivation extended to Persia, and the Isles of the Archipelago; from thence during the reign of the Emperor Justinian, it extended to Greece. Its cultivation commenced in Sicily and Italy in 1540, and from thence, finally, it was introduced to Provence in France.

Yet in France, although they raise so much silk, they still import annually to the amount of 30,000,000 francs of raw silk, or one-third of all they consume, for the supply of their manufactures.

In England, the climate, from its humidity, or other causes, is said to be unsuited to its growth; yet from the year 1821 to 1828, according to a late and authentic work on the Silk Trade, they imported of raw silk, 24,157,568 lbs., worth \$120,787,580. Of this amount, \$59,881,283, came from Italy alone.

In Tuscany, so fine is their climate, that two successive crops of silk are annually produced; and so extensive is its cultivation throughout Italy, that according to the Count Dandolo, two-thirds of all their exports consist of silk.

Yet in our own country, so highly favored in all respects by nature, its successful introduction is mainly due to individual exertion. But how much soever has been done and still is doing, the importations seem increasing. The imported silks left for annual consumption in the United States,

in the year ending 30th September, 1834, amounted to ten millions, with a trifling variation, and from the extreme beauty, added to the great usefulness of this material, the whole quantity consumed must very shortly be double this amount.

Wherever the Mulberry finds a congenial climate and soil, there also the silk worm will flourish. Such a climate and soil, and such a country is ours, throughout its whole extent, from its eastern to its western shores.

The cultivation of the Mulberry, and the raising of silk, may each with advantage be conducted as separate branches of the same department. The avenues of the Mulberry tree, on the plains of Reggio, with the habitations for the insects which are on either side, are the property of wealthy citizens who reside in Reggio; these furnish to another class the leaves, and every necessary requisite, receiving in return two-thirds of the product. Thus, too, in France, the plantations of the Mulberry constitute there, in many places a part of the real estate of the landed proprietors, the leaves being annually sold on the trees.

Of all the various mulberries for silk, the *Morus Multicaulis* or *Chinese Mulberry*, seems that which is most adapted to our wants. It originated in a country famous from antiquity for its silk, and renowned for its industry—a parallel to our own in its climates and divers latitudes—a country, a climate bounded and controlled by an eastern ocean. To the qualities which have been elsewhere stated, and to the very important reduction of labor in gathering the leaves, from their extraordinary size, we have still to add, that they appear to be preferred by the insects to all others; at the establishment of Madame Parmentier, they are stated to have left seven other species of the Mulberry to feed on this.

The sudden and extraordinary extension of the silk manufactures, both in France and in England, during the last ten years, has been mainly ascribed to the machine invented in France, by M. Jacquard; and the powerful impulse thus given, has been assigned to the *Jacquard Loom*. This loom is stated to perform all those labors, which had heretofore been exclusively confined to the most skilful hands, with important economy of time and labor in the preliminary steps, and is so decidedly superior to all other looms, for all the curious varieties of figure-silk weaving, that it has superseded them all, both throughout France and England.

Those resources, the millions we now annually expend for silks, the productions of foreign industry, and of foreign policy, draining our country of its treasures—those vast sums should be preserved to our citizens. This industry and resource of wealth, must not be compromised nor bartered, nor sacrificed to rival and particular interests, or to the interests of rival nations. The cultivation of silk being in no wise exclusive, but a great and general interest, alike adapted to every region of our country, from the north to the extreme south; from the Atlantic to our territories which are bounded on the Pacific ocean—it demands that equal share of protection which has been bestowed on cotton, on iron, on tobacco, and on the productions of the sugar cane. But the encouragement

of the cultivation of the Mulberry, and of the growth of silk, in the United States, as a resource of Agriculture seems not to have formed any part whatever of what is called "THE AMERICAN SYSTEM."

The enterprise, the fertile invention, the noble efforts of individual exertion, have already accomplished much; but the field is very broad and of vast extent; much yet remains to be done. That industry which still slumbers; that portion, which unawakened is now lost, being alone more than sufficient to accomplish all, if once aroused and rightly directed—more than sufficient to recover again those very considerable sums, the millions so prodigally expended, with interest an hundred fold.

By those unceasing toils and mighty efforts, and matchless labors, for which our people are so distinguished; the millions thus recovered, will not only be their just reward, but will add to the substantial wealth of the nation, and to the glory of the whole Republic.

Of the MORUS MULTICAULIS, or Many-stalked Mulberry.

CHINESE MULBERRY.

PEROTTET MULBERRY.

By these several titles we have distinguished a highly ornamental tree from China—a fruit tree—a new and most valuable species of Mulberry, for the nourishment of silk worms, a tree which is represented as possessing such decided superiority over all others, that it will be speedily substituted for them all, in every region of the globe.

The tree grows vigorous, upright and beautiful; the leaves in a light, friable, rich, and humid soil, are large and cordate; but in a dry and arid soil, they are of less size, elliptical, and without the heart-shaped indentation, their breadth being six inches, and their length eight; but in rich and humid soils, their dimensions are sometimes far greater, extraordinary specimens having sometimes measured more than a foot in breadth, and fifteen inches in length. They are curled or convex on their upper surfaces, of a deep and beautiful shining green.

These are the main qualities, which alone have been deemed sufficient to render this precious plant an invaluable acquisition to any country. While it was yet unknown even to Europe or America to be also a valuable fruit tree till in 1830, the tree bore fruit for the first time, and abundantly, in France. The fruit is long, black, and of sufficiently beautiful appearance; its flavor good, being intermediate between that of the red and that of the black Mulberry.

The introduction of this plant from Asia, is due to M. Perottet, Agricultural Botanist, and traveller of the marine and colonies of France. And according to M. Poiteau, the name of the zealous traveller should in justice be affixed to the precious tree which has given him celebrity, and which will contribute so much to the prosperity of French industry. It was brought by him to France [we believe in 1824] in that vast collection and variety of productions which he had during thirty-four months, procured in the seas of Asia, or gathered on the coast, or in the land of Cayenne.

The *Morus Multicaulis* appears to have originated in the elevated regions of China, from whence it has been disseminated throughout the low plains near the sea-shore. Among the number of Mulberries cultivated by the Chinese, for the nourishment of silk worms, the *Morus Multicaulis* appears to be the most esteemed of all, not only for the facility with which it is propagated and grown, but still more for the essentially nutritive qualities which the leaves possess. Chinese inhabitants assured M. Perotter, that to this tree the disciples of Confucius are indebted for the prosperity and solidity of their empire.

The first discovery of this tree by M. Perotter, took place at Manilla, the capital of the Philippine Isles. In descending the river which traverses that city, and on its banks, M. Perotter discovered the garden of a Chinese Inhabitant, where for the first time he saw the *Morus Multicaulis* which was there found growing with a vast variety of other precious plants, which had here been congregated from India, from Ceylon, from Sumatra, and from other sources, and from China.

In August, it was brought by M. Perotter from Manilla, and first introduced into the Isle of Bourbon; from thence into Cayenne and France. At a later period, it was sent from Cayenne to Martinique, and from France to Guadaloupe; also to Senegal. The numerous plants which are already disseminated in the divers climates of Africa, America and Europe, have all been produced by the two individual plants brought by M. Perotter from Manilla.

Besides what has been already stated, the characteristics which distinguish this Mulberry from others are those which result, 1st. From the remarkable property which the roots possess of throwing up numerous flexible stalks; the facility with which it is propagated from layers, or even from cuttings. 2d. The great length which these stalks acquire in a short space of time. 3d. From the remarkable development which the thin, soft and tender leaves speedily acquire, and the promptitude with which they are renewed.

This Mulberry should be cultivated in hedge rows, and never suffered to rise higher than seven or eight feet. M. Perotter has assured us, that but a few years are sufficient to raise considerable fields of them in full vigor, sufficient to support a immense quantity of silk worms; and regular plantations can without difficulty, be formed by planting the shrubs at a distance of from six to eight feet asunder, a space sufficient for the extension of the branches; sufficient also for cultivation, and to facilitate the gathering of the leaves. This last operation he further informs us, is so much facilitated by the flexibility of the stalks, and the superior size of the leaf, that a child is sufficient for gathering the food of a large establishment of silk worms.

The *Morus Multicaulis* according to M. Perotter, will be readily acclimated, inasmuch as it originated in a climate analogous to that of France. It appeared neither to suffer from the excessive cold of the northern, or the intense heat of the intertropical regions; as the plant left in the government gardens of Cayenne had acquired during eight months, a truly remarkable development, being clothed at that time with leaves of extraordinary size. Those also which were cultivated in Senegal, although planted in an arid soil, and situated beneath a dry and scorching sky, exhibited an appearance sufficiently satisfactory; yet

in all respects they had acquired less development than those which were planted in the humid climate of Guiana. A humid, rather than a dry soil seems best to suit this plant.

This Mulberry braves the most rigorous winters of France, not having suffered in the least even during the severe winter of 1829-30. I have taken particular pains to ascertain how they have fared in the extreme north of that country, and have very lately been informed by letter from M. Eyries, a gentleman of Havre, that they have supported well during ten years, the most rigorous winters of the extreme north of France. He has cultivated them to considerable extent, from their first introduction to that country.

And we are lately assured that, by the information received from all quarters, this Mulberry is destined (in France,) to replace the common White Mulberry every where, for the nourishment of silk worms, and that the silk which the worms form from the food afforded by this plant, is of the first quality. And from the experiments of Dr. Deslongchamps of Paris, it appears to have been ascertained, that the cocoons produced by the worms fed exclusively on this plant, are even rather heavier than other cocoons.

In our own country there may yet perhaps be some, who would advance the question whether this most desirable plant will endure the winters of northern climates. At New York, on Long Island, this Mulberry has sustained unprotected, the rigors of seven winters, as I am informed, and the extraordinary winter of 1831-2 which destroyed so many trees hitherto deemed hardy even to the root.

I have indeed sanguine expectations, that the *Morus Multicaulis* may prove as hardy in our climate, as the Peach tree, which was originally from Persia—or the cherry tree, when once their roots have become established. Its vegetation being rapid and luxuriant, and prolonged to a later period in autumn than that of most other trees, or till the tender and yet vegetating tips of the twigs, are checked by the frost; these extreme ends will generally be lost, as they always are of the common White Mulberry, when young.

In our climate there are many kinds of trees, which need protection during the first winter, though they may never require any afterwards. Such are the young seedling plants of but a single summer's growth, of the *Cherry*, *Plum*, *Pear*, the *Quince*, and the *White Mulberry*, &c. all which require to be carefully, compactly placed in cellars during winter, their roots buried in soil; or occasionally for protection, may be laid in out of doors compactly and in a slanting position, their bodies being in part protected by soil. For all these species are liable to be killed occasionally to the root by the first winter, or to be utterly destroyed by being thrown out by frost, yet in the second winter it is far otherwise; their roots becoming strong and firmly established, the well ripened wood of the second year, and the wood of two years growth, becomes indestructible by any but very extraordinary winters. I have taken the same precautionary measures with the young and tender plants of this Mulberry so valuable—the layers of but a single summer's growth, which are separated in autumn.

I will offer some further evidence of the hardiness of this plant, in addition to what I have stated in a former number, (see N. E. Farmer of the 15th of January, last.) But the experiments which

are now in progress elsewhere, as well as here, on a more extensive scale will, as I trust, soon enable us to put this subject more fully at rest.

Very late in the spring of 1833, more than an hundred young trees of the *Morus Multicaulis*, were set out on the Place of S. V. S. Wilder, Esq. in Bolton, Worcester County. The soil springy, the exposition cold, and sloping to the north; Mr. Joseph Breck, a distinguished botanist of Lancaster, the town adjoining, having especial charge of these plants, has lately very critically examined them. Thus unfavorably situated, and unprotected, they have borne the last winter without injury, except only the very tips of the twigs. Mr. Breck is persuaded that they are even hardier than the common White Mulberry, since some hundred of the latter, which stood very near, were killed half way down to the ground by this same winter.

I have just received a letter of the 30th ult. from John Gordon, Esq. a public spirited gentleman, who has during the last year, made trial of the *Morus Multicaulis* at Hampstead, N. H. These plants grew well during the summer, and have borne well the winter, and are now luxuriantly vegetating to within two or three inches of the tips. Mr. Gordon is now making trial of the White Mulberry, and the *Morus Multicaulis* in the city of Portland, in exposed situations; also of the silk worm, confident that they will all succeed well, and that the culture of silk will answer well in that climate.

Although the Mulberry flourishes most luxuriantly in a moist and rich soil, and protected situation, yet as your intelligent correspondent, R. of Hingham has before observed, (see N. E. Farmer, page 211 of the 15th of January last,) the leaves in such soils and situations, are more crude, and not of a quality so nourishing. Besides, the growth of the tree in such situations, being much more rapid, the wood is consequently more tender and more liable in northern climates to be killed by winter; and authors seem to be agreed, that the proper soils for the Mulberry tree, are dry sandy, or stoney; and trees on dry, light soils, and situated on the open plains, and on hills the most exposed to cold winds, will generally be found to suffer least of all from the effect of winter. Such appears to have been the case in 1831-2; the ravages of that destructive winter seem to have been generally confined to trees growing in particular situations and soils. Even delicate trees and plants the natives of more southern climes, become more hardy, and capable of supporting the northern winters by being planted on the north side of buildings and fences, and in their shade. The exposure to the most intense degree of cold, in such situations, is more than compensated by the protection which is thus afforded to the plants during winter, from the pernicious and far more destructive rays of the sun.

The prediction, in 1830, of the late Dr. Felix Pascalis, that, "after the discovery of this plant, a doubt no longer exists, that two crops of silk may be produced in a single season;"—this prediction has since been fulfilled—its truth confirmed by experiment—the soil and cultivation, the habitations for the successive generations of insects being yet the same; all thus converted to a double use, and the whole production doubled. It must be obvious, that the actual profit thus augmented must be manifold.

The honor of the discovery of this plant, its history and uses, belongs to M. Perotter. And much

that I have here stated has been before brought to light by the indefatigable researches of Gen. Dearborn. On this, as on other subjects, much is due to his exertion. WILLIAM KENRICK.

Newton, June 7th, 1834.

For the New England Farmer.

PRESERVING FRUIT TREES FROM MICE.

MR. FESSENDEN, In your paper No. 45 of the present volume is an article on the "injury to fruit trees from mice;" written by a or taken from the Northern Farmer. The writer says he "has within a few years lost trees to the value of \$500." He desires to be informed if there is "no means of destroying this mischievous race." Of the means of destroying mice, except on a small scale I know nothing, but to preserve trees from their destruction is easy, and costs nothing; I say nothing, because there is nothing to be done, but what should be done, were there not a mouse in creation. Viz: while in the nursery, keep the ground clear of weeds, grass, and rubbish of every kind, by ploughing and hoeing frequently; when planted out never let a weed or spear of grass grow within three feet of them; prevent this by digging about them Spring, Summer, and Autumn, leaving the earth about them smooth as possible, particularly in Autumn. I have pursued this course with many trees both in the nursery, and planted out, with perfect success, but when I have neglected my trees (as I have in one or two cases) and have not kept the ground clear of grass, &c. the mice have destroyed some of them.

Yours with respect, NATH'L S. BENNETT.
Framingham, June 6th, 1834.

For the New England Farmer.
WHITE PINE.

MR. FESSENDEN, This is a request that some of your correspondents or yourself would communicate the best method and time for transplanting the White Pine (*Pinus Strobus*) also directions for forming a grove of these, and what trees flourish in their company, and produce a proper contrast? It is well known that fifty or sixty years since, this tree was scarcely to be found in districts where now it fills the forest. This is the case in our country, where some of the older inhabitants can recollect its extreme rarity. Though it is so forward under the hand of nature, it is nevertheless very coy of the hand of man, at least when the ordinary method of cultivation, transplanting, is used.

The books tell much concerning the proper way of making a nursery by sowing the seed, but are silent as to the transplanting, except perhaps hinting that it is not the best method of culture; but this is not true, and the tree is transplanted in this country at least with success, as may be observed in Brookline and Cambridge. The time for removing evergreens differs somewhat from that proper for deciduous trees. The *Pinus Cembra*, of which there is a notice in the N. E. Farmer, vol. x, p. 369, deserves the consideration of agriculturists, and it might be acclimated, and the soil being probably favorable it would become an important acquisition.

Duxbury, June 7th.

From the Maine Farmer.

A STRANGE THING UNDER THE SUN.

Two brothers, blacksmiths, Joshua and Thomas, both lived once in the same town. A farmer

had been to Thomas to get his ploughshare repaired, but when he tried it, to make it plough he could not. He then carried it to Joshua. Joshua took it up and looked at it gravely for some time. At length he fixes it in his tongs and lays it on the anvil and says, Here John, take that sledge and strike a blow there. It was done.—Joshua looked again. It was not quite right. He placed it again on the anvil, and told John to strike another blow, a little lighter; this was done and master Joshua looked again. It did not quite suit him, and John was ordered to strike again, but very lightly. He did so. Master looked and was satisfied. "The plough will work now" said he "but I think it is strange that Brother Thomas does not know any better."

There is a moral to this story. It teaches us to look well to little matters, and not let any thing pass our hands half finished, when a little care and judgment properly exercised would render it complete.

I have seen a farmer make his posts for bars with the holes so far apart that small sheep, goats, geese, &c. could pass through easily, when another hole or two and bars sufficient to fill all the holes, would stop all such creatures, and save a great deal labor and vexation.

I have seen a farmer make quite a decent gate, but he could not afford the time or the expense to hang it. It would do for the present. He sets it in its place with a stick against it; but it is too much to take away the stick and replace it. Of course it is soon left to stand alone, slanted a little of course. The geese and pigs, &c. with their scrutinizing eyes, soon find the vacant spaces, and walk into the garden without ceremony. The sequel I need not tell. I have seen others—yes I have done it myself—make hedge and log fences, year after year, where rocks were plenty, because the time could not well be afforded to make stone fences. The result frequently is, the logs get rotten, will settle or fall down in places, or the cattle break through weak places and occasion a deal of trouble. And not only this, but the fires every two or three years will make a general sweep, and then two or three weeks must be spent just to get up something that will do for the present. For my own part I have most heartily repented of this practice, and am determined to forsake it as fast as I can. Is it not strange that people will do so?

I have seen farmers running about all winter, speculating, or something else to little purpose—no preparation made for fence, by getting out stuff. Spring comes and finds the fences down and nothing of substance to repair them with. The poor people are in difficulty, and I sometimes think it strange they will do so.

Another thing I have thought strange—it is that any person who has no fence that he can depend upon, should keep a herd of colts and young horses, of all cattle the most unruly to torment himself and neighbors. I have sometimes seen a herd of these animals come prancing over our mountains in high glee, jumping over fences, running through cornfields, grainfields, &c. without ceremony; I protest against this, it is a public nuisance.

But perhaps you will say fine the owners; I will tell you another story by way of answer.

A certain Grand Juryman while attending court, wished to speak with the Judge after the court was adjourned. He was shewn into a chamber where the honorable Judge,—lawyers, &c. were

engaged playing cards. A little surprised to see a Grand Juryman enter so unexpectedly, one says, I suppose you will present us for gambling? My oath said he, requires me to do so, but where the whole court are criminals, to whom shall I present you? J. H. J.

Peru, May 11, 1834.

SAFE METHOD OF EXTERMINATING RATS.

LET those who wish to poison rats, instead of applying to the chemist, intimately mix a pound of plaster of Paris (in its unslacked state) with about double the quantity of oatmeal. Let them place this within the reach of the rats; they will eat it greedily, and without being deterred by any bad taste. Through the humidity contained in their stomachs, the plaster of Paris will "set," and form an indigestible hard mass, which will, in fact, present, upon dissection, a good cast of the rat's stomach, and speedily produce a kind of Aldermanic death, i. e. by irremediable indigestion.

MASS. HORTICULTURAL SOCIETY.

Horticultural Hall, June 14th.

EXHIBITION OF FRUITS AND VEGETABLES.

GRAPES. A fine basket of White Chasselas grapes were exhibited by S. G. Perkins, Esq. ripe the 31st of May.

From the graperies of Jacob Tidd, Esq. very handsome clusters of the White Chasselas and White Frontignac or Muscat.

FIGS. A large and beautiful specimen of ripe figs, of excellent quality, from the Hon. John Lowell.

GREEN PEAS for premium by Col. Marshall M. Wilder of Dorchester. WILLIAM KENRICK.

An adjourned meeting of the Mass. Horticultural Society was held on Saturday, June 14th.

The Committee chosen at the last meeting, not being ready to report, the meeting was adjourned to Saturday, June 21st, at eleven o'clock.

CHA'S. M. HOVEY, Secretary pro tem.

FLOWERS EXHIBITED.

Mr. John A. Kenrick, Newton—Roses, Honey-suckles, Pæonies, Corchorus, Scotch broom, Spiræas, &c.

Mr. Thomas Mason, Charlestown Vineyard—Ranuncus, Anemonies, Roses, Larkspurs, Austrian and French Yellow Roses, Fraxinella, Papaver bracteata, and variety of other flowers, with a splendid specimen of Cactus speciosissimus.

Messrs. Hovey & Co. Cambridge—Roses, Pæonies, Lilies, Geraniums, Spiræa, Sophora, Viburnum, Phlox, Pinks, Roses, &c.

Mr. S. Walker, Roxbury—Double white rocket Iris-cælestina, &c.

Messrs. Winship—various kinds of Flowers; among which were the double flowering Japan clematis, and the Cymbidium dependens, or air plant, in fine bloom.

The members of the Society who were present, with the Committee, were highly gratified with the elegant specimen of Nerium splendens, Coffea arabica finely fruited, and the full grown and delicious flavored Figs, equalling in the opinion of gentlemen present if not surpassing most of those grown in a more genial climate, by Mr. Leonard, Gardener to the Hon. Jno. Lowell. Also, with the Dahlia Flowers, presented by R. Rogerson, Esq.

By order of the Committee,

JONA. WINSHIP, Chairman.

From the Southern Agriculturist.

PREPARATION OF BEET SUGAR.

Paris, December, 1833.

THE beets are collected when ripe, or a little before that time, and immediately brought to the cleaning machine. This consists of a cylinder composed of ribs of wood, and revolving in a trough filled with water; into this cylinder the beets with their tops, as torn from the ground are put, and thoroughly washed; one objection to cutting off the tops before washing, is that a quantity of saccharine matter escapes. They are then brought to the rasping machine, which breaks down their cellules and reduces them to fine pulp. In some places the beets are brought dried to the manufactory. They should then be cut in transverse slices, and dried in a stove heated somewhat below the temperature of boiling water, that being sufficient to destroy the principle of organic life in the beet, and which militates against the action of affinity present in all inorganic substances. The temperature should be below 112 deg. Fahr. as it appears that at that point the coloring matter is formed readily, either from a reaction taking place between the principles contained in the beet, or during the maceration, from the water used in that process. For the same reasons the time and degree of heat used in maceration, should not exceed that requisite to extract the saccharine matter.

The quantity of fibrous matter contained in the beet is so small, in proportion to the liquid, and the cellules containing the latter, are so minute, that it requires a most complete rasping to prepare them for the press. The presses most esteemed are those which press but a small quantity at a time, and that with expedition; as by these means most juice is obtained from the pulp. They are of two kinds, the screw and the hydraulic; but the limits of this paper will not permit me to give you a description of either; suffice it to say, that the pulp, having been placed in strong closely woven cloth, is submitted to these presses, and the juice flows immediately into cauldrons (coppers), in which it undergoes the process of defecation. From good beets Dombasle obtains 85 per cent. of juice; from poor and indifferent 60 per cent. is usually got. From boiling them and then cutting them in slices, over which a current of water flows successively, he has obtained 90 per cent.; 60 lbs. of juice of good white beets yield from 4½ lbs. to 5 lbs. of raw sugar; those grown in rich wet soils give less.

The juice thus, or otherwise obtained, is subject to a spontaneous alteration, which is important to know. If exposed to the atmosphere, it gradually acquires a stringy and oil-like consistence, which, increasing in proportion to the evaporation of the liquid, at last resembles that of the white of an egg. These changes take place in less than twenty-four hours, when the temperature is at 20 deg. to 24 deg. centigrades. The mass which before this change never showed any free acid, now contains both *acetic* and *nancetique* acids, (the latter described by Braconnot in 1813—*Annales de Chimie*.) It is supposed that this alteration takes place in the beet itself when kept in too large heaps, and thus subjected to too high a temperature. It is the formation of this viscous matter which presents a great obstacle to the crystallization of sugar, and which glueing together the crystals prevents the molasses escaping. To guard against this alteration of the juice, the utensils used in keeping and in stirring the beet juice should be kept scrupu-

lously clean, and the greatest celerity possible should be used in all the necessary operations, from the grinding to the defecation. The instruments of wood must be frequently washed with the greatest care, and when laid aside, should be covered with milk of lime, and which should not be removed before their immediate use is required. One of the best means to prevent this alteration in the beet juice, is to employ small coppers, capable of containing about two hectolitres (two hundred English quarts) each; five of this size are capable to serve for the fabrication of 30,000 lbs. of beet juice per diem. Although the heat may be applied to a large copper, long before it is filled from the juice flowing from the presses, too much time passes before it is full, and arises at the temperature of 70 deg. or 80 deg. centigrades, at which temperature the juice may be considered safe from the alteration above mentioned.

I will not dwell on the *modus operandi* of the substances used in the defecation of the juice, but proceed, at once, to state the process most generally adopted. The quantity of lime varies from 2½ to 3½ "grammes" for each "litre" (quart) of the juice. As a general rule, the quantity must be increased in proportion to the quantity of saccharine matter contained in the juice. The purest lime should be used, and in its greatest degree of causticity, and it should be reduced into a clear pap by means of a little water before put into the coppers. It is best to put it in the copper as soon as a few bucketfuls of juice has flowed in, it acting in preventing the decomposition already so much insisted on, which is apt to take place to a more or less great degree before the juice arrives at the requisite degree of temperature.

Two methods are now used to complete the operation. One consists in preventing the boiling of the juice, by extinguishing the fire before it arrives at 100 deg. temperature, and then being left at rest for half an hour, when the scum rises to the surface, the liquid is afterwards drawn off by a cock placed near the bottom of the copper.

The method preferred by Dombasle, is to continue the fire under the copper, and, when near the boiling point, watch the *first bubble* which swells under the scum; immediately take a ladleful of the juice from the spot where it arises, and pour on the spot a quart of cold juice which checks the action immediately; the same operations must be repeated as often as a bubble appears (which must never be permitted to burst and spread over the scum), until, by examining the liquor taken up in the ladle, the defecation is found complete, when the fire must be extinguished, and the liquor allowed to rest for a half hour before drawn off; always guarding the bubbles, which may continue to rise, from bursting by the means already indicated. By this method the operator is rendered complete master of the work, and in those cases in which sufficient lime has not been used, he can have time to add more when he finds that complete defecation will not take place. For this purpose he has only to dilute a quantity of the milk of lime in the cold juice, which he pours into the copper. Even the introduction of the cold liquid alone sometimes produces a remarkable effect; a single quart changing the state of the liquor and causing the separation of the feces in large flakes. The complete defecation is known by the liquid in the ladle being of a fine white wine color, and perfectly transparent, and that the feces are divided into large flakes which settle

quickly to the bottom of the ladle. The liquor having been drawn off, the scum and residue are then placed in cloths extended over a table composed of wooden ribs, and having an elevated border; below this is placed an inclined plane which conveys the juice into a reservoir containing the rest of the clarified juice. The cloths should be of cotton in preference to wool, which the lime, still retained by the feces, is apt to rot.

Now, place the juice thus defecated into coppers destined to concentrate it. The form of the different coppers is not an unimportant object. Those used in defecation should be deep, viz. the depth half their diameter; and when bullock's blood is employed in defecation, they should be as deep as wide. The coppers for concentration should be as wide as one foot in depth to four or five feet in diameter, those for cooking differ from these last only in having their bottoms three "lignes" in thickness at least. The combustible matter is pit-coal or wood, and the furnaces must be adapted to each. Animal charcoal is used in the concentration; that made from bones and not horns is employed. Its action is not confined to removing the color, but it acts also in an inexplicable manner, enabling the syrup to support a higher degree of temperature; and without it, it is almost impossible to cook the syrup on an open fire, which process will now be described.

Place the clarified juice into the concentrating coppers, and saturate the excess of lime, if it exist, by diluted sulphuric acid; it should not be rendered completely neuter, only so far that the purple (toursesol) paper changes slowly blue. Then pour in the animal charcoal in the proportion of 1½ lbs. to a "quintal" (100 lbs. weight) of the liquor. Boil and continue the concentration until the hot liquor supports (*porte*) 20 deg. *a l'areometre de Beaume*. It is then withdrawn and left to deposit in deep wooden vessels and kept in a cool place, where it precipitates during cooling, a great quantity of calcareous salts, among which the malates are most abundant. When the syrup is perfectly clear, (at the end of twenty-four hours usually) it may be submitted to the action of cooking (*cuite*.)

Being placed in the cooking coppers, carry it, by a brisk fire to 32 deg. of *areometre de Beaume*. Extinguish the fire, and throw in animal charcoal, in the proportion of ¾ lb. to a quintal of the juice which has furnished the syrup, viz. half the quantity employed the first time. Let the syrup now cool to about 75 deg. stirring it occasionally to mix the charcoal well with it; then carry it into the clarifying coppers, and submit it to the usual clarification of bullock's blood; it is then drawn off clear and the cooking proceeded with. The scum, &c. is placed on woollen cloths to drip. The proceeding is considered the most difficult part of the process. The cooking coppers now receive it, and the point of concentration is told by touching the ladle dipt in the syrup and drawing out the thread. The thumb being below, when the finger is drawn from it, the thread should break at the thumb. The thermometers used for this purpose are rejected by M. Dombasle, as not to be relied on. When of the proper consistency, it is poured out into the "*raffraichissoir*," where it crystallizes.

The method recommended by Payer, is to evaporate the *defecated* juice to twelve degrees of Beaume, without adding any animal charcoal; then draw off all the liquid into a filter filled with animal charcoal; evaporate *rapidly* the filtered liquid to twenty-five degrees of Beaume, and filter

again through a filter of Dumont with fresh animal charcoal. The syrup is thus rendered ready for the cooking, it yields more crystals of a more beautiful hue, and the suppression of the bullock's blood no longer leaves a portion soluble and alterable. Payer recommends also the copper on a pivot for cooking the clarified juice, it (cooking) being in this accomplished in five or eight minutes, while the other method requires thirty or thirty-eight minutes; moreover, the alteration is six times less in syrup cooked in this than in the usual stationary coppers. The fire being brisk the ebullition is commenced in one minute in every part of the copper; frequently the syrup is too viscous and rises in a thick froth, and incompletely wetting the bottom of the boiler, hazards the burning of the sugar; to check this instantaneously, throw in a small quantity of fresh butter, four or five grammes, which Dombasle recommends to have been previously melted, as that operation prevents the sugar receiving any flavor from it; as soon as the syrup, by means of the touch, is found cooked, draw the cord, and thus canting the copper, its contents pour out at once; open the stop cock and proceed with the process; seven or eight products being thus united in the rafraichissoir, it is rolled into the rooms containing the forms, for much of the French beet sugar (raw) is in loaf form.

I have thus, my dear sir, given all the information I possess relative to the manufacture of beet sugar from the expression of the juice to the crystallization. I have drawn freely from the latest and most esteemed works, but as yet have not been in a refinery. I thank you for the hint, how I may render my stay here serviceable to my native city; and shall use my endeavors to gain admittance into a refinery before my return.

I am, with great regard, dear sir, yours, very respectfully,
F. WURDEMAN.

From Goodsell's Farmer.

EXPLANATION OF AGRICULTURAL TERMS. (Continued from No. 46 of this Vol. N. E. Far.)

35. *Carbonic Acid*—is a combination of carbon and oxygen, in the proportions of eighteen parts carbon to eighty-two parts oxygen. The sources of this acid are immense: It exists in the atmosphere, it is found in abundance in many mineral waters, as at Ballston and Saratoga, in the State of New York; it is produced by the combustion of wood and charcoal; by the fermentation of liquors, and by the decomposition or putrefaction of vegetable substances; but the largest store of it is that enormous quantity solidified or rendered solid in all immense beds of chalk and limestone with which every part of the globe abounds. Of limestone, 45 parts in every 100 are computed to be carbonic acid. As before observed, when uncombined with any other substance, it always exists in the state of gas. It is heavier than atmospheric air. If this gas be poured from a wide mouthed jar upon a lighted candle, it will be as effectually extinguished as by water.

36. *Effervescence*—is a sudden disengagement of gas taking place within a liquid, and separating that with a hissing noise. We have an example of this, as before observed, by dropping a little pearlash into cider. The carbonic acid is disengaged and rises in the form of gas, producing much foam, with a hissing noise.

37. *Chemical Affinity*—is a term used to signify the attraction or tendency there is between the

particles of certain substances of different natures to unite, thereby forming a third substance possessing properties altogether different from those of either of the two substances of which it is composed. Thus, potash and oil have a tendency to unite, thereby forming soap, which is a third substance very different either from the oil or the potash of which it is composed. Those substances which are capable of uniting in this manner, are said to have an affinity for each other, as oil and potash; but oil will not unite with water, and therefore those substances which do not form a chemical union, are said to have no affinity.

38. *The primitive Earths*—are four, viz. clay, sand, lime, and magnesia. These are the only earths which enter into the composition of soil; they also enter in very minute portions into the organization of plants. Sand and clay are by far the most abundant; lime is required but in small proportion: every soil; however, is defective without it. Magnesia is found but in few soils; its place is well supplied by lime; its entire absence, therefore, is not considered any defect.

39. *Clay*—in agricultural publications, is called alumina, alumine, aluminous, or argillaceous earth. The term clay should not be given to a soil, which contains less than one-sixth part of aluminous earth.

40. *Sand*—is called silex, silica, silicious earth, or earth of flints. "The epithet sandy is not properly applied to any soil, that does not contain at least seven-eighths parts of sand, and sand soils are to be distinguished into silicious sandy, or flinty sand, and calcareous sandy, or chalky sand."

41. *Lime* as it exists in the soil, is commonly called calcareous earth. "The word calcareous is not properly applied to any soil, unless a specimen of it is found strongly to effervesce with acids; or unless water having a channel in the soil affords a white earthy deposit when boiled." "Each of these earths answer a determinate and specific purpose in the economy and growth of plants; and the perfection of soil lies in a mixture of the whole."

42. *Basis of the soil*—By this term is understood the primitive earths which enter into its composition.

43. *Vegetable Matter*—all vegetable substances in a decaying or rotten state.

44. *Animal Matter*—all animal substances in a putrifying state.

45. *Organic Matter*—is a term applied both to animal and vegetable substances in a putrifying state.

46. *Vegetable Mould*—the earthly remains of vegetable substances which have either grown and decayed on the soil, or have been conveyed thither in the progress of cultivation.

47. *Loam*—is a combination of vegetable mould with the primitive earths.

48. *Peat*—is a substance dug out of swamps; it is produced from the decay of vegetables; is of a fibrous texture, and may be cut with a spade. Peat is frequently used for fuel; it is of no use as a manure until it shall be brought into a state of fermentation, or putridity, which may be done by mixing it with other manures. Running water also extracts its antiseptic qualities, and leaves it ready to pass into a state of decomposition.

49. *Marle*—is a substance consisting of lime with a small portion of clay, and sometimes of peat, with a mixture of marine and animal remains. It is found extensively in some situations, at different depths under ground, and is distinguished into

shell, clay, and stone marle. It is useful as a manure.

50. *Putrescent Manures*—are all animal and vegetable substances in a decaying state.

51. *Excrementitious Matter*—is the manure from animals.

52. *Long Manure*—is green barnyard manure before it is rotted.

53. *Short Manure*—is barnyard manure made fine by rotting, so as to be cut easily with a spade.

54. *Fossil Manures*—are lime, marle, plaster of Paris, and other substances which operate on the mechanical constitution of the soil, but do not afford direct nourishment to plants.

55. *Compost Manure*—is that which is formed by the mixture of various substances, as turf, pond mud, weeds, ashes, lime, &c. with stable or yard manure, so as to constitute one uniform mass or substance, fit for the improvement of the soil.

56. *Irrigation*—is the turning of water from its natural channels, and carrying it by ditches over grass lands, so as to render them more highly productive.

57. *Tilth*—is the condition in which ground is left after tilling. When it is well pulverized by the plough and harrow, and made light to a sufficient depth, it is said to be in good tilth.

58. *Stumming Casks*—is burning within them matches covered with sulphur. A strip of cloth, ten or twelve inches long, and from one to two inches wide, smeared with melted sulphur, and lighted, is let down into the cask, and suspended from the bung. Some have a long, tapering bung, that may fit any cask, with a crooked wire in the small end, from which to suspend the match.

59. *Must*—is the new liquor pressed from apples or grapes, before it has worked or fermented.

60. *Lees*—is a term used to signify the gross sediment or settlings found at the bottom of casks containing fermented liquors.

61. *To rack Cider or Wine*—is to draw them from off their lees or sediment, into clean casks.

ROOKS.

From a notice of some length, on the usefulness of the rook, which has been published in the *Magazine of Natural History*, vol. vi, p. 142, 143.

"In the neighborhood of my native place, in the county of York, is a rookery belonging to Wm. Vavasour, Esq. of Weston in Wharfedale, in which it is estimated that there are 10,000 rooks, that 1 lb. of food a week is a very moderate allowance for each bird, and that nine-tenths of their food consists of worms, insects and their larvæ; for, although they do considerable damage to the fields for a few weeks in seedtime, and a few weeks in harvest, particularly in backward seasons, yet a very large proportion of their food, even at these seasons consists of insects and worms, which (if we except a few acorns and walnuts in autumn) compose at all other times, the whole of their subsistence. Here, then if my data be correct, there is the enormous quantity of 468,000 lbs. or 209 tons of worms, insects, and their larvæ, destroyed by the rooks of a single rookery."

REPELLING OF INSECTS.

TAKING the earth away from the roots of trees, and returning back earth mixed with a small quantity of sulphur, will keep insects from ascending the trees. Other repellants of insects may answer the purpose for one Spring—such as quick-lime, fine salt, old urine, strong soap-suds, a strong decoction of tobacco, onions, &c.—*Farm. Assist.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JUNE 18, 1834.

HEALTH AND CLEANLINESS.

Farmer's Work. Be so good as to see that every deposit of unhealthy and contagious matter in, upon and about your premises is removed, or so disposed of as to become food for your plants instead of the cause of disease to yourself or family. Life without health is scarcely to be desired. Indeed, the valetudinarian rather lingers than lives—his existence is a burthen to himself, and an annoyance to his friends. The chief requisites for health are exercise, tranquility of mind, good air, wholesome diet, good water and temperance in all things. If the forehanded farmer is not provided with all these, it is usually his own fault. Some drones, however, who undertake to live by farming, but are most likely to die by indolence, carelessness and inattention to their own important interests, contrive to provide for themselves and families an atmosphere, which would "all but" poison a crow or a toad, much more a human being:

"Thus, as the ancient poets learn us,
The crows, which flew o'er lake Avernus,
Were so bestench'd in one half minute
They giddy grew and tumbled in it."

If it is indelicate and unwholesome to take into the stomach water or food, poisoned with putrescence, what is it to take into the lungs the gases generated by putrefaction? Yet some farmers' barn yards, cellars, hog-pens, back houses, &c. are suffered to remain, during the summer months in such a state that, if they do not generate cholera or typhus fever, in their worst forms, which we fear is too frequently the case, they at least cause a degree of languor and debility, which embitters existence, and in a great measure disqualifies for any of the useful purposes of life.

"Ah! what avail the largest gifts of Heaven,
When drooping health and spirits go amiss,
How tasteless then whatever can be given,
Health is the vital principle of bliss."

The unhealthiness of the exhalations to which we allude is not the only argument against suffering them to go at large to poison as well as to "manure the atmosphere." It is a fact that the vapor or gases which emanate from decomposing animal and vegetable substances, which are so injurious to health in animals, are food for plants. The substances which offend the senses and injure the constitution of the farmer and his family, if arrested and properly appropriated by the hand of skilful industry, "may be so modified in the great laboratory of nature as to greet us in the fragrance of the flower, regale us in the plum or nectarine, or furnish the stamina of life in substantial viands from the garden, the field, and the stall of the cultivator."

But how is the desirable object of converting poison for animals into food for vegetables to be effected? We cannot better answer this important inquiry than by quoting a passage from "*Letters of Agricola*," attributed to John Young, Esq. of Nova Scotia:

"Earth is a powerful absorber of all the gases, which arise from putrefaction. The earth possesses not only the property of retaining the putrid steams, which are formed from the dung of decomposing bodies within itself, but also of attracting the effluvia when floating in the air. The salubrity of a country depends on the latter quality; as the practice of burying the dung in the earth is

founded on the former. The stench proceeding from the dissolution of organized matter never rises through the ground to assail the nostrils, although it is sufficiently offensive from bodies corrupting in air and water. A strongly dunged field, after being ploughed, sown and harrowed, sends forth a healthful and refreshing smell—a proof that all the putrid vapors, which otherwise would annoy us, are absorbed and retained for the nutrition of the crop. It is on this account that the poorest earth can be enriched to a very high degree by mere exposure to the gases of putrefaction. Put a layer of common soil along the top of a fermenting dunghill, from 12 to 13 inches thick, and allow it to remain there while the process is carrying on with activity, and afterwards separate it carefully from the heap, and it will have been impregnated with the most fertilizing virtues. The composts, which of late have attracted such universal attention, and occupied so large a space in all agricultural publications, originated in the discovery of this absorbing power of the earth, and in the application of it to the most beneficial purposes. A skilful agriculturist would no more think of allowing a violent fermentation to be going on in his dunghill, unmixed with earth and other matter to fix and secure the gaseous elements than the distiller would suffer his apparatus to be set at work, without surmounting his still with the worm to cool and condense the rarified spirit, which ascends by evaporation. In both, the most precious matter is that which assumes the æiform state; and to behold it escaping with unconcerned indifference, is a demonstration of the most profound ignorance."

Rye, as long as a liberty pole. A bunch of rye, grown the present season by Mr. ISAAC STONE of Waltham, is left in the N. E. Farmer Office, which contains stalks, or culms 7 feet 4 inches in length.

ITEMS OF INTELLIGENCE.

Depopulated Village. Extract of a letter from a traveller, dated at St. Louis.

A few miles below Alton, on the Mississippi, I passed a deserted village, the whole population of which had been destroyed by the "Milk sickness." [A fatal spasmodic disease, peculiar to the Valley of the Mississippi. It first attacks the cattle, and then those who eat beef or drink milk.] The hamlet consisted of a couple of mills, and a number of frame houses, not one of which was now tenanted; but the dried weeds of last year choked the threshold of the latter, and the raceways of the mills were cumbered up with floating timber, while the green slime of two summers hung heavy upon their motionless wheels. Not an object but ourselves moved through the silent town; and the very crows themselves seemed to make a circuit around the fatal place when they came in view of the thickly sown burial ground on the skirts of the deserted village.

Saffron. Some of the Hatfield farmers have begun to cultivate this medical and coloring plant in the field; six or seven acres have been planted this season. It requires a good deal of labor, especially in gathering the flowers. A farmer who has cultivated it a few years past, thinks that after the flowering season commences the gathering of the flowrets from an acre of saffron will employ five girls for a month. The price of Saffron was high the last year; some sold in New York at \$1.50 per pound. It may not bring half that sum this year. A square rod, it is said, will yield a pound or more.

Saffron has been extensively cultivated in some coun-

ties of England for centuries, but the English Saffron is a different plant from ours; it does not belong to the same class. The English plant continues several years, ours is annual. The flowrets of the English Saffron are purple, ours are yellow. Ours is called bastard-Saffron by the English. This kind is imported into England from the East Indies. The English Saffron after it is dried and made into cakes, does not average over 25 pounds to the acre. Saffron is used in medicine; and in Europe by dairy-women, confectioners, painters, dyers, &c. —*Hampshire Gazette.*

A new locomotive of great power and masterly machinery has been constructed for the New Castle and Frenchtown Rail Road, by Mr. E. A. G. Young, of Norfolk. The Beacon states, that on the first trial of the engine, notwithstanding the stiffness of the machinery, and without any headway being given to it, it ascended the inclined plane at Frenchtown, (the grade of which is 42 feet to the mile) with a load of 55 1-2 tons, at the rate of 12 miles per hour.—*Baltimore American.*

New Steam Carriage. A Manchester correspondent of the Globe says; "this day (Thursday se'night) a trial was made with a new steam carriage, built by Messrs. Sharp, Roberts & Co. of the place, carrying fifty to sixty persons; it went off in great style on the Oxford road, and did six miles in twenty minutes. This is a rate of travelling on the common road far surpassing any thing hitherto attempted, and will suggest the inquiry whether it will be necessary to go to the expense of making Rail Roads.

Experiment of Dr. Hunter. The celebrated Dr. Hunter gave one of his children a full glass of sherry every day after dinner for a week. The child was then about four years old, and had never been accustomed to wine. To another of the same family, under similar circumstances he gave a large orange for the same space of time. At the end of the week he found a very material difference in the pulse, heat of body, and state of bowels, of the two children. In the first the pulse was quickened, the heat increased, and the bowels deranged, whilst the second had every appearance of health. He then reversed the experiment, to the first he gave the orange, and to the second the wine. The effects followed as before; a striking evidence of the pernicious effects of vinous liquor on the functions of life in a full health.

Bottled Oysters. We saw a day or two since the neck of a common pint rum bottle found in an oyster bed in our harbor, and in which a number of erratic oysters had taken up their lodgings. They had most undoubtedly, introduced themselves when quite young, and had so snugly invested themselves to the inner surface, and became so firmly attached to their unnatural abode, that it was impossible to extricate them without actually breaking the bottle. In this predicament they died. They must have lived there a long time. The condition of these stupid oysters fitly illustrates the history of the tippler. He is introduced to the bottle in early life, and sucks away at its contents year after year—and becomes more and more cemented to it; it is at last the permanent abode of his unnatural appetite; in ninety nine cases out of a hundred, the rough hand of death alone can dissolve the connexion, and he dies as stupid as the oyster.—*Portsmouth Journal.*

Remedy for Ringworms. A correspondent of the American Farmer writes as follows: "After I had the tetter nearly twenty years on my hand, and had used a hundred dollars worth of tetter ointment, which took off the skin repeatedly without effecting a cure, a friend advised me to obtain some blood root (called also red-root, Indian paint, &c.) to slice it in vinegar, and afterwards wash the part affected with the liquid. I did so, and in a few days the scurf was removed, and my diseased hand was as whole as the other.

Asthma. We learn from an intelligent friend who has long been afflicted with this most distressing complaint, that the fumes of burning paper, saturated with a solution of saltpetre gives him perfect relief. He keeps a quantity of the paper—which has been simply soaked in strong saltpetre water, and afterwards dried—constantly on hand, and on the recurrence of a paroxysm obtains almost instant relief from burning half a sheet or a sheet in his room. Others who have been similarly affected, have tried it with a corresponding benefit. In no case has it been known to fail, so far as his information extends. We deem the testimony sufficient to warrant the publication of the prescription which certainly has the merit of simplicity. If it shall prove generally efficacious its value is beyond price. It can be readily tested.—*Newark Ad.*

The Aerial Plant. The burning sands of hot climates, even at Karsfields of the Cape of Good Hope, which are so arid and scorched that no water can be extracted from them, are the media in which the most succulent vegetables of which we have any knowledge, flourish and evolve; so deleterious, indeed, is a wet season to their growth, that they are destroyed by it. There are also various tribes of vegetables that are destitute of roots and which can only be supported and nourished by the air, and by the moisture which the atmosphere contains. A large portion of the class *Fuci*, have no root whatever; and it is stated that the *Aerial Epidendron*, (the *Epidendron Flos Aëris*.) denominated aërial from its extraordinary properties, and which is a native of Java, on account of the elegance of its leaves, the beauty of its flower, and the exquisite odor which it diffuses, is plucked up by the inhabitants and suspended by a silken cord, from the ceiling of their apartments, from whence it continues from year to year to put forth new leaves, to display new blossoms, and enshrine new fragrance, although fed out of the simple bodies before stated.—*London Magazine.*

A Market House is to be erected in Philadelphia—the roof metallic plates, supported by iron columns.

GRINDSTONES ON FRICTION ROLLERS.

Grindstones of different sizes hung on Friction Rollers and moved with a treader, is found to be a great improvement on the mode of hanging grindstones, the ease with which they move upon the rollers renders them very easy to turn with the foot, by which the labor of one man is saved and the person in the act of grinding can govern the stone more to his mind by having the complete control of his work.

The above Stones may be found of a very superior kind, and hung completely as above described at the Agricultural Warehouse, 51 & 52 North Market street. je 18

WILLIS'S IMPROVED STRAW & HAY CUTTER.

For sale at the Agricultural Warehouse 51 and 52 North Market street. The straw or hay cutter is a machine well worth the attention of every farmer, and should be in common use with every farmer feeding stock.

From the great improvement and simplicity of these machines of Willis's, the work is done with great ease and despatch, and requires but one person to operate it, which is not the case with any other machine, every farmer who is disposed to use his fodder to the best advantage and preserve his animals in the best health will in all cases cut their fodder. my21

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, $\frac{3}{4}$ miles from Boston, by the City Mills.

This Nursery now comprises a rare and extraordinary collection of fruit trees, Trees and Shrubs of Ornament, Roses, &c. and covers the most of 18 acres. Of new celebrated *Pears alone*, 130 kinds, a part of which, having already been proved in our climate, are specially recommended.—Of Apples 200 kinds—Peaches 115 kinds—Cherries, 55 kinds—Plums, Nectarines, Almonds, Apricots, Quinces, Grape Vines, Currants, Raspberries, Gooseberries, Strawberries, Figs, &c. &c.—selections from the best varieties known—a collection in unequal proportions of 800 varieties of fruit.

White mulberries for silk worms—the fruit poor. Also the *Morus MULTICAULIS* or *New Chinese Mulberry*, a beautiful fruit tree, so superior for silk worms to all others.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; selections from numerous importations, and first rate sources. White, Flowering Horse Chestnuts. Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering plants, a choice selection of 280 varieties, including the *Pæonies*, *Moutan* and *Papaveracea*—and 24 other kinds—and 83 splendid varieties of double Dahlias.

Gentlemen are invited to forward their orders early Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with Geo. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Jy 17

GOOSEBERRIES.

A new importation of superior kinds, just received, of all colors, by WM. KENRICK, Newton.

TURNIP SEED.

For Sale at the N. E. Seed Store, 51 and 52 North Market street, Early Dutch Turnip, Early Garden Stone ditto, Yellow Stone do.; White Flat Winter do.; Long Yellow French do.; Yellow Aberdeen do.; Ruta Baga do.

The two last are excellent kinds for Cattle. je 18

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

1 Case wet (but not damaged) Bishops Lawn.

1 do. do. do. Book Muslin.

Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation. m 14

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 6-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table mats. a 16

BRASS SYRINGES.

Just received at the Agricultural Warehouse, a good assortment of Willis's improved Brass SYRINGES for Green Houses, Grape Vines, &c. &c.—see Complete Farmer, page 345. je 4 J. R. NEWELL.

ZINC WARE.

Just received, a further supply of Zinc Milk Pans, Kettles and deep Bake Pans, and for sale at the Agricultural Warehouse, No. 51 and 52 North Market Street.

The manufacturers of this article having closed their works, no more of them can be procured at present,—and as the season is at hand when these are most wanted, and as they are found on trial to produce a great increase of Milk, they are highly recommended to the public as one of the improvements of the day. my 14

BOSTON TRUSS MANUFACTORY.

JAMES P. FOSTER, Successor to the late John Beath, at the sign of the Eagle and Truss, No. 338 Washington street. Trusses made to order and fitted to the patient. All sorts of repairing done to Trusses in the best manner.

Among the variety of Trusses made and sold by J. F. Foster, are Patent Elastic Spring Trusses, with Spring Pads—Trusses without steel springs. These give relief in all cases of rupture, and in a large portion produce a perfect cure. They can be worn day and night. Improved Hinge and Pivot Trusses, Umbilical Spring Trusses, and Trusses with ball and socket joints.

Suspensory Trusses for individuals troubled with Hydrocele are always kept on hand, together with all the other kinds made by Mr. Beath, formerly.

The former friends and customers of Mr. Beath are respectfully invited to call as above, where they will be faithfully and personally attended to by Mr. FOSTER. LYDIA BEATH.

N. B. Ladies wishing for either Trusses or Backboards will be waited upon by Mrs. Beath, at her residence, 585 Washington street. L. B.

Asparagus, 8 cents a bunch—Radishes, 3 cents—New Onions, 4 cents—Turnips, 3 cents—Lettuce, 3 cents—Cucumbers, from 12 to 17 cents a piece—Peas, \$2 a bushel—Strawberries, from 50 to 75 cents a box—Gooseberries, 12 to 17 cents a box.

BRIGHTON MARKET.—MONDAY, June 16, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 296 Beef Cattle, (including 30 unsold last week); 12 cows and calves, and 385 swine—95 Beef Cattle were left within a few miles of the market, and are not sold.

PRICES. Beef Cattle—Sales were but a very little lower than last week. We quote prime at 6 a 25; good at 5 50 a 5 75; thin at 4 50 a 5 25.

Cows and Calves—We noticed sales at 22, 24, 27, 30, and 35.

Sheep and Lambs—Lots of lambs with a few old sheep were taken at 1 75, 2, 2 17, 233, and 242.

Swine—We noticed one lot sold, nearly all barrows, at 6 1-4 at retail 6 1-2 a 7 for sows, and 7 1-2 a 8 for barrows.

MISCELLANY.

From Mellen's Poems.

THE HOST OF NIGHT.

Look at the host of night—
These silent stars!
What have they known of blight,
Or heard of wars!
Were they not marshall'd there,
These fires sublime,
Gemming the midnight air
Ere earth knew time!
Shine they for aught but earth,
These silent stars!
And when they sprung to birth
Who broke the bars,
And let their radiance out,
To kindle space?
When rang God's morning shout
O'er the glad race!
Are they imbedded there,
These silent stars!
Or do they circle air
On brilliant cars!
Range they in frightful mirth
Without a law—
Or stand they above earth,
In changeless awe!
Are they all desolate,
These silent stars—
Mung in their spheres by fate
Which nothing mars!
Or are they guards of God—
Shining in prayer!
On the same path they've trod
Since light was there!

STARS.

MANY stars which were marked by the ancients in their catalogues are no longer seen, but others are visible which were unknown to them. While a very few have receded, others have gradually increased in brilliancy. Some astronomers are of the opinion that the whole of our solar system is moving onward toward the constellation Hercules. If this be true, then it is very certain that the class of magnificent worlds, to which this globe belongs are revolving in an orderly manner, round some great central point of attraction, of which the human eye has never had a view. In the course of the last one hundred and fifty years some of the fixed stars appear to have moved. The star Arcturus has moved three minutes and three seconds in seventy-eight years. No fact has been more satisfactorily demonstrated, than that the law of gravity operates positively, from the sun to the planet Herschel, eighteen hundred millions of miles, and it is therefore probable, that the heavenly bodies which are discoverable with telescopes of the greatest power, are in subjection to some vast, inconceivably vast, central globe, self balanced somewhere in celestial space; and that may be the resplendent throne of God.

RESULT OF ACCIDENT.

MANY of the most important discoveries in the field of science have been the result of accident. Two little boys of a spectacle maker in Holland, while their father was at dinner, chanced to look at a distant steeple, through two eye glasses placed before one another. They found the steeple brought much nearer than their shop windows. They told their father on his return; and the circumstance led to a course of experiments, which ended in the

telescope. Some shipwrecked sailors once collected some sea weeds on the sand, and made a fire to warm their shivering fingers, and cook their scanty meal. When the fire went out they found that the alkali of the sea weed had combined with the sand, and formed glass; the basis of our discoveries in astronomy, and absolutely necessary to our enjoyment. In the days when every astrologer, and every chemist was seeking after the philosopher's stone, some monks carelessly making up their materials, by accident invented gun powder, which has done much to diminish the barbarities of war. Sir Isaac Newton's most important discoveries—concerning light and gravitation—were the result of accident. His theory and experiments on light were suggested by the soap bubbles of a child; and on gravitation by the fall of an apple, as he sat in the orchard. And it was by hastily scratching on a stone, a memorandum of some articles brought him from the washerwoman's, that the idea of lithography first presented itself to the mind of Shenfelder.—*Am. Mag.*

WORTHY EXAMPLE OF ECONOMY.

MATTHEW CAREY, speaking of his marriage, says, "My wife was about ten years younger than me. She was industrious, prudent and economical, and well calculated to save whatever I made. She had a large fund of good sense. We early formed a determination to indulge in no unnecessary expense, and to mount the ladder so slowly as to run no risk of having to descend. Happy, thrice happy would it be for thousands and tens of thousands, if they adopted and persevered in this saving course. What masses of misery would it not prevent! Some idea may be formed of the fidelity with which we observed this rule, when I state, that at a time when I did business to the amount of forty or fifty thousand dollars per annum, I hesitated four or five years about changing my gig for a one horse four-wheel carriage—and nearly as long about purchasing a carriage and pair. And during the whole period of our marriage, I never, as far as I recollect, entered a tavern except on a jury or arbitration, or to see a customer, or at a public dinner, or on my travels—never in a single instance for the purpose of drinking."

NATIONAL MEMENTOS.

In the English House of Lords, the Lord Chancellor is seated on a woollack, that the importance of the woollen manufacture, the great staple of that country may be indelibly impressed on the public mind.

When the first Congress met after the adoption of the Federal Constitution, it was in contemplation, but afterwards abandoned, to have the seats of each delegation wrought with some device, descriptive of the staples of their several States, viz.

New-Hampshire to be represented by a pine-tree.
Massachusetts, by a barrel of fish.
Rhode-Island, a hamper of cheese.
Connecticut, an ox.
New-York, a hoghead of flaxseed.
New-Jersey, a bundle of flax.
Pennsylvania, a bag of wheat.
Delaware, a bag of wool.
Maryland, pig and bar iron.
Virginia, a hoghead of tobacco.
North Carolina, a barrel of tar.
South Carolina, a bag of cotton.
Georgia, a barrel of rice.—*Boston Atlas.*

CURE FOR THIRST.

Of boiling soft water take three quarters, and of fresh tamarinds one quarter—put them together in an earthen jar for three or four hours—strain off the liquor—bottle it, and in about four weeks it will be fit for use—and a wine glass full of it in hot weather is one of the most agreeable, healthful nectars, and most powerful extinguishers of thirst ever discovered.

Although the tongue has no bones, it breaks bones.

CULTIVATOR.

Just received at the Agricultural Warehouse, a few of Seaver's improved expanding CULTIVATORS, for weeding among Corn, Potatoes, &c. &c.

VALUABLE NEW WORK ON AGRICULTURE.

This day Published, by GEO. C. BARRETT, at the Office of the N. E. Farmer.—The

COMPLETE FARMER AND RURAL ECONOMIST,
By THOS. G. FESSENDEN, Esq.

Containing a compendious epitome of the most important branches of Agriculture and Rural Economy, and the following subjects arranged in order:

| | | | |
|--------------|---------|----------------|-----------------|
| Soils, | Wheat, | Beans, | Mangel Wurtzel, |
| Grasses, | Rye, | Swine, | Ruta Baga, |
| Grain, | Oats, | Lime & Gypsum, | Potatoes, |
| Neat Cattle, | Barley, | Fences, | Haymaking, |
| Barns, | Millet, | Hedges, | Ploughing, |
| Dairy, | Hops, | Sheep, | Poultry, |
| Hemp, | Peas, | Horses, | Wood: |
| Flax, | | | |

and to which is added—Descriptions of the most approved Implements and Machines, with Engravings.

The work is printed on the best of paper, and is intended for a Farmer's Directory, which every farmer should be possessed of, and relying upon an extensive sale will be afforded at the low price of \$1.

[From the New England Magazine of June 1st, 1834.]

All men love a farm and a garden, and Mr. Fessenden is better qualified than any other man in New-England to compose a good work on these practical subjects—albeit he was in his youth addicted to the less profitable pursuits of wit and poetry. This work should be on the shelf of every farmer's library: there is much in it to guide him and nothing to lead him astray. All is practical, nothing is speculative. It embraces the entire transactions of a farm. The materials for the work must have been collected through many years. Excellence is comparative—and any traveller in England may there best notice the defects of American husbandry. Still, however, it is with caution that in our soil and climate we should adopt the English modes of cultivation.

The soils are first treated of, then grasses, grain, cattle, animals, dairy, manures, harvesting, poultry, implements, &c. &c.

Those who would have a choice of implements may choose among many at the New-England Agricultural Warehouse. Here is every facility for saving labor and increasing crops; and the implements that are not useful—if any such there be—are studies of ingenuity. All are made in the best manner, and they are in some sort an illustration of Mr. Fessenden's book, many being neatly delineated in it.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[If No paper will be sent to a distance without payment being made in advance.]

Printed for GEO. C. BARRETT by FORD & DANRELL, who execute every description of Book and Fancy Printing in good style, and with promptness. Orders for printing may be left with GEO. C. BARRETT, at the Agricultural Warehouse, No. 52, North Market Street.

NEW ENGLAND FARMER.

PUBLISHED BY GEO. C. BARRETT, NO. 52, NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE.)—T. G. FESSENDEN, EDITOR.

VOL. XII.

BOSTON, WEDNESDAY. EVENING, JUNE 25, 1834.

NO. 50.

THE SCARIFIER AND CULTIVATOR,

—Of which the above is a representation, is an implement of great value, is beginning to be rightly appreciated, and coming into general use in different parts of the country. It has five teeth, or scarifiers as represented in the figure; each of which answers most of the purposes of the coulter and share of a plough as well as supplies the place of the hoe with less labor and greater effect. These scarifiers are so constructed as to raise and pulverize the ground, leave it level, and in fine tilth, and at the same time destroy weeds.

Implements for similar purposes have been invented and recommended by European farmers. Among these are the Scotch Scarifier, Parkinson's Cultivator, Hayward's Cultivator, and Beatson's Cultivator. Cuts and descriptions of these may be seen in Loudon's Encyc. of Agr. pp. 381, 2, 3. It is obvious, however, at the slightest glance, that these machines are more expensive, complicated, and we should believe less effective than the above, which is called Seaver's Cultivator, from the name of its ingenious inventor, of Pennsylvania.

Loudon in describing the above named European implements makes the following observations:

"The use of pronged implements as substitutes for the plough, is comparatively a recent invention. They differ from the plough, in stirring the soil without reversing its surface, or altering its form, unless, indeed, they in some cases tend to even or level inequalities; they act both as the plough and harrow at the same time, and on suitable soils, and at proper seasons, much more labor is effected with less expense of men and cattle. Wherever, therefore, lands require to be stirred for any purpose, excepting that of reversing the surface or laying them into beds or ridges, recourse may be had to pronged tillage implements."

Seaver's Cultivators are well adapted to stirring the soil between rows of hops, likewise is a good substitute for a harrow in covering grain after sowing. The facility with which it is expanded and contracted, so as to be adapted to different widths of spaces between rows of vegetables, &c. is an improvement which adds greatly to the value of the implement.

The above Cultivator is for sale at the Agricultural Warehouse, 51 & 52 North Market street. The proprietors of this establishment having the right of this improved patent Cultivator now offer it for sale with all its improvements: as they have a large supply now on hand shall be happy to supply their customers, friends and the public. They have been at much trouble and expense in introducing this new implement as well as many

other labor saving machines. They hope to meet with that support and encouragement their attention and labor demands.

ON SUCKERING CORN.

I HAD the pleasure, about four years ago, to spend a day in company with old Mr. Macon of North Carolina, when our conversation was principally on subjects of agriculture; and among others the cultivation of Indian corn. After having inquired whether I had the suckers which grew from the roots of the corn pulled off, as is the common practice, and received my answer in the affirmative, he informed me that he had suffered them to remain, having, from repeated experiments, ascertained that they did not injure the corn; but on the contrary, the suckers more frequently than otherwise produced good ears of corn; and that if they failed to do so, there was an increase of fodder. I have since tried the experiment, and witnessed the following results: That after carefully examining the ears of corn on the stalks producing suckers, they were found to be as good as the ears on the surrounding stalks not producing them—that a large majority of the suckers produced good corn, though the ears generally were smaller than those on the mother stalk, and that (of course) there was an increase of fodder. Without entering into an inquiry, whether corn ought not to be planted so thick as to prevent its producing suckers, (if thick planting will prevent it, of which I am not sure,) or whether the pulling them off may not injure the corn, by inflicting wounds on the stalks, I can now safely recommend Mr. Macon's practice, as saving the time and labor of pulling off suckers, and what is of more consequence, as producing an increase of the crop of corn and fodder. I ought to add, that none but the suckers growing from the root ought to be suffered to remain.—W. M. WATKINS. Charlotte co. March 4.—*Farmer's Register.*

From the Mechanic.

STRENGTH OF CORDAGE.

THE Boston hemp manufacturing company have lately put up a machine, at their ropery on the Milldam, for the purpose of determining the strength of their cordage, spun in the common method by hand. A great number of experiments have been made by breaking ropes of various sizes and kinds on this machine, and the following exhibits the average result of these trials. The figures show the number of pounds required, by each inch of the square of the girt of the rope to part it.

| | |
|--|----------|
| Whale line spun by hand, best that could be procured, | 776 lbs. |
| Whale line spun by machines, | 994 |
| Russia bolt rope, 1st quality, | 723 |
| Bolt rope of machine spun yarns, | 915 |
| Running rigging, 1st quality Russia, | 442 |
| Running rigging, American, spun by hand, | 631 |
| Running rigging of machine spun yarns, | 717 |
| Cotton line, | 604 |
| Coire rope, | 215 |
| Rope made of Manilla hemp | 610 |
| Rope made of New Zealand flax, <i>Phormium Tenax</i> , | 722 |
| Mean of all hand spun hemp rope, | 633 |

Mean of all machine spun hemp rope, 875 lbs.

Showing the machine spun rope to be 36 per cent. stronger than the hand spun. If however, we reject the trials on Russia cordage which is very weak, the superiority of the machine spun ropes is reduced to 24 per cent. over all others.

In no instance whatever, was the trial on machine spun ropes made on selected specimens, but the pieces to be tested were taken from common coils as made for use. Indeed it happened that the machine spun ropes, except the whale lines, were made of hemp inferior in quality to that usually wrought in the machines. The modulus of cohesion, of the strongest ropes in these experiments is 30,700; or a rope of this strength could be let down into a pit 30,700 feet, or 5-8ths of a mile before it would be broken by its own weight. A rod of iron can sustain itself according to Mr. G. Rennie, only for a length of 19,700 feet.

On the 27th of March by the politeness of Mr. Treadwell, we witnessed the operations of the machinery for preparing the hemp and spinning the yarn; and we were also shown the method of impregnating the ropes with tar, which is done uniformly throughout their whole thickness, the tar being kept at a temperature below the boiling point. The ropes made of these yarns have the appearance of being *stained* rather than *tarred*.

The superior strength of the ropes made from yarn spun by machinery, appears to consist in this, that the fibres in the middle of the yarn are nearly of the same tension as those of the outside, whereas in the yarn spun by hand, they are much more tense in the middle; and the short fibres being the first to give way, the whole stress is thrown upon the outside ones, which being fewer in number, consequently cannot bear so much strain as a rope made up of fibres of equal tension.

The machine for trying the strength of ropes, is so constructed as to try them fairly and accurately. The following experiments on the strength of three ropes were tried in our presence, and we have no doubt of their correctness.

No. 1. Whale line spun by hand—girt 2 inches; broke by 2240 pounds.

No. 2. Whale line made by Boston hemp company, spun by machinery—girt 1 7-8th inches; broke by 3520 pounds.

No. 3. Running rigging made by the Boston Hemp company—girt 2 1-8th inches; broke by 3440 pounds.

As No. 2 was one seventh smaller than No. 1 we should add 502 pounds to the weight it actually bore, making 4022 pounds, for the weight it would have borne, if it had been of the same size as No. 1. Consequently it was 64 per cent. stronger than No. 1. Again, No. 3 was one ninth larger than No. 1; we must therefore deduct from the weight it actually bore, 382 pounds leaving 3058 as the weight it would have borne, had it been as small as No. 1. It was therefore 25 per cent. stronger than No. 1.

Rhubarb, or Pie Plant. The cultivation of this plant is on the increase. The stalks are put up in bunches, like asparagus, and sold in the markets at fair prices.

From the Baltimore Farmer & Gardener.

ART OF MANAGING SHEEP.

I HAVE been very desirous of ascertaining the particular method in which Mr. Barney of Philadelphia manages his sheep, that enables him so far to exceed every body else in producing fine mutton and good wool.

On his late visit to this city, I put the question to him, wherein consisted his superior management of sheep? he gave the following reply:—He said, a gentleman visited him not long since, and on going to his sheep yard, and viewing it asked him the same question. He showed at that time from 50 ewes, upwards of sixty lambs, all lively and brisk, with a loss, *I think he said, of three or four.* The gentleman observed to him that he had his shed covered with dead lambs, and asked wherein the secret in breeding lay. Mr. Barney observed to him, you stuff your sheep with dry food. Yes, as much good clover hay as they will eat, was the reply. Mr. B.—You give them no water, but suffer them to go out in time of snow and eat it as they are disposed to? Yes. Then, said Mr. Barney, there lies the secret. Your sheep fill themselves with dry hay; they get no water; and they have not a sufficient supply of gastric juice to promote the digestion of the hay in the stomach; they cannot raise it to *chew the cud*; they lose their appetite; they are thrown into a fever, and cannot bring forth their young, or they bring forth a feeble, starved lamb, that falls off and dies the first exposure to the cold or rain. On the contrary, I take care to provide my sheep with good clear water in summer and winter. I feed them regularly with hay through the winter, and give them ruta бага and mangel wurtzel every day. The ewes produce me 120 per cent. increase in lambs. You cannot, says Mr. Barney, get along without ruta бага and mangel wurtzel.

This gentleman has just sold his sheep for upwards of seventeen dollars per head to the butchers.—It is his opinion that sheep are the most profitable stock that a man can raise; and it appears he makes use of no expensive food, or increased quantity of it. But the secret of raising good stock of every kind, consists in maintaining that regular and cleanly mode of proceeding, which preserves the digestive organs of the animal in a healthy state, and enables them to convert what they eat into chyle, suitable for the nourishment of the animal.

A.

ALE FROM MANGEL WURTZEL.

By a Correspondent of the Coventry Herald.

From seeing an article in a newspaper, in the year 1829, describing how a good beverage might be produced from the mangel wurtzel, I have made a number of experiments, and have at length completely succeeded. In the article before alluded to, it was stated, that a portion of about ten pounds of the root to a gallon would make a good liquor; but with fifteen pounds weight to the gallon, an excellent ale will be produced; the addition of two pounds weight of treacle to a firkin will be a great improvement. One-third malt and two-thirds mangel wurtzel liquor will make capital ale; so that, even in this way, an important saving will be effected.

Our method is first to mash and clean the roots well, take off the top completely, scrape (rather pare) off the outer rind, slice and boil them until soft and pulpy; squeeze the liquor from the pulp as much as possible, and then boil it again with

about six ounces of hops to nine gallons, and work with yeast in the usual way. Thus a cottager, by boiling his pot over his winter fire of a night, and using the root as we have described, might seldom be without a refreshing beverage, even the greatest part of the year, for the roots may be kept in a cool place, in a proper state for use, during most of the winter. The leaves, stripped from the plants in August and September, are valuable for the cow or pig, not retarding its growth in the least; and the roots, boiled and mashed in the liquor, and either milk or a small quantity of meal added, will feed the pig at a trifling expense.

The culture of this invaluable root is very simple. Let the single seeds be put on well manured ridges, eighteen inches apart, and six or eight inches between the plant; hoeing down and keeping clean from weeds will be all that is necessary.

BOARD FENCE.

THE subject of fencing is one of much importance to the farmer; and every thing on that subject is highly interesting. The communication of *Dan. Bradley, Esq.* on the best manner of making board fence, is worthy of an attentive perusal from every farmer. A fence made in the manner he described, would undoubtedly be durable; but I would suggest whether the setting of the posts alternately on both sides of the fence would not greatly add to its strength. I have a fence in view made in this way some twenty years ago, standing in a situation exposed to high winds, yet as erect as when first built. A farmer of my acquaintance who has had much experience in this kind of fence, carried his partiality for it so far as to build a door yard picket fence in this manner; and for a plain picket fence it was the handsomest I ever saw. The posts were sawed six inches at bottom, two at top, and four inches wide. The upper rail was spiked on the posts, and the other two halved on. The pickets were two inches wide, one inch thick, and five feet in length, reaching to the ground. The bottom board was one foot wide, nailed on to the pickets, this giving a heavier finish than when the pickets are placed upon it.—The posts standing outside, instead of looking bad, were an ornament, adding an appearance of stability and firmness, always pleasing to a farmer.

To illustrate more fully the advantage of setting posts both sides of the fence, I will describe a fence I have seen made where almost the only support it had consisted in thus placing the posts. The posts were made of plank 18 inches wide, 2½ inches thick, 4½ long, sawed in two diagonally, so as to make two posts 18 inches wide at bottom and 1 inch at top—in shape a right angled triangle. These posts were placed on flat stones, and the boards nailed on in the usual manner, well battened and a good top board spiked on. As a precaution to its overturning, a strip of white oak plank three inches wide and three feet long is driven into the ground on the outward edge of each post, and nailed to it. A fence made in this manner, in situations not exposed to winds, may stand a long time—at least it will not rot—can easily be righted up, and a post set in the ground to support it when necessary. It at least shows the advantage of having the posts placed on both sides of the fence and having the bottom larger than the top. This kind of fence, if the boards are an inch thick, and well nailed, will withstand any horse or bull, and may perhaps be advantageous to those who cannot procure good timber for posts.

At any rate, set your posts on both sides of your fence, build it as recommended by *Dan. Bradley*, and if it wont stand a hard blow, I am mistaken.—*Genesee Farmer.*

We agree with the above writer, that fencing is a matter of the first consequence to the farmer and gardener; and that every hint on the subject becomes interesting. In order that we may supply our ratio in the progressing improvements, we relate the result of a mode we saw practised in that way.

The boards were made of the common yellow pine, 3-4 inch thick;—previous to their being put in the fence, they were laid for some time in a trough of the proper length, containing thin whitewash; care being taken that the boards were entirely submerged, and kept separate, by thin strips being placed between them. They were suffered to lie in this position until they were pretty well saturated with the whitewash; then taken out, and others put in their place, to undergo the same operation.

At the time we saw this fence, it had been standing seven years. One part of the string of fence was made in this way, and the other part made of materials of the same quality taken indiscriminately, but without the use of lime. That part which was taken made without lime, was at the time we speak of, undergoing repair; and at least one half the boards of which it was composed, were so far decayed, as to be unworthy of being made use of in the new fence. On the contrary, on examining the boards in the other portion of the fence, which had been treated with lime as above mentioned, it was found that it did not need repairing, and no signs of decay were perceived. On being chipped off, the boards presented the appearance, all through their substance, that may be seen in the staves of an old lye tub; and, to all appearance, would last as much longer, without needing a renewal.—*Baltimore Farmer.*

SAVOY CABBAGES.

THE green curly Savoy cabbage is one of the finest garden vegetables that is grown, and ought to take the place of every kind of cabbage put up for winter's use for the table. It is as hardy and as easily cultivated as any other kind of cabbage; it is much more delicate, sells more readily, and as many, indeed rather more, can be grown from a square in the garden, or from an acre of land.

An acre of land has 4310 square yards—equal to 43,560 square feet: two feet wide each way is enough to plant the Savoy cabbage; thus, an acre would yield 10,890 cabbages, which require as little cultivation as potatoes, after the ground is well prepared, and the plants are planted out, and which would bring, at the moderate price of one cent apiece, the enormous sum of one hundred and eight dollars and ninety cents.—*N. Y. Farmer.*

BRIMSTONE FOR CATTLE.

It is probably not known to many of our farmers that brimstone is valuable for cattle in keeping them free from ticks. These vermin are not only filthy in their appearance but an injury to the cattle. A piece of brimstone as large as a grain of corn, well pulverized, given in a little salt, will cause them to drop off, and prevent others from getting on for eight or ten days. I consider brimstone as necessary for a cow in the summer as salt.—*South. Plan.*

MAPLE. (Acer.)

There are nine sorts of this tree, enumerated by botanists, in this country; the most valuable of which is the sugar maple; of which kind only, something shall be said.

Where the farmer wishes to save his sugar maple trees, he ought not to tap them in the common way; but, instead of this, bore a hole two or three inches into the tree, out of which the sap can be drawn; and let it be plugged up after the sap has done running.

The method of making the sugar is too well known to need any minute description. It would be often well, however, if those who make this sugar, were to observe more cleanliness, in regard to the vessels in which the sap is gathered. Old troughs, which have lain for years exposed to the weather, are not very proper receptacles for the sap, if regard be had to the cleanliness of the sugar, and of course its value. Some make use of vessels made in the form of pails, which they keep for the purpose, and this is certainly more cleanly. The vessels can be laid up every year, after the time of using them is past, and be preserved many years.

In clearing pasture lands which abound with sugar maple, it would be well to preserve these trees as they do no injury to the pasture; but the difficulty is, that as soon as they become more exposed to the winds they are blown down. But let all the small maples in such grounds be left, and in a few years these will grow up with sufficient strength of root to withstand the winds, and become an article of profit, and ornamental to the farm. They may also be very easily dug up in the woodlands, and transplanted into such pastures.

This is a piece of economy which the farmer would do well to observe, if he wishes his farm to yield due supplies of sugar, when that article shall have become more scarce. Twenty trees to an acre, would do little or no injury to the pasture; and ten acres of such a maple orchard would, in a few years, yield no inconsiderable quantity of sugar. By boring the trees as above directed, no essential injury is done to them; so that they might be increasing in growth for half a century, or perhaps double that length of time.

The sugar of the maple may be grained in the manner directed for graining the sugar of the beet; or it may be done in the vessels in which the sap is boiled, if it be not too large for the purpose.

The trees may be raised from cuttings, or from the seeds.—*Farmer's Assistant.*

PLANTING FOR CHILDREN.

The strong desire existing in the human breast to provide for offspring, converts that toil which produces sweat on the brow, into pleasant and cheerful exercise. The Farmer rises early and labors until the setting of the sun, planting, sowing, and reaping—and all this to feed and clothe his family, in the hope, too, of having a little annual surplus for his children when he is gone; but, alas, how many toil in vain!—twenty, thirty, or forty years of care and labor appear to have made no provision for the rising members of the family. Had there been plantations of valuable timber or fruit trees made by the Farmer in his young days, their produce would now give a son or daughter a considerable "setting out."—*New York Farmer.*

Cream of tartar, rubbed upon white kid gloves, cleanses them very much.

CHINESE MULBERRY.

We have heard of no one in this part of the State having lost a single plant of the Chinese Mulberry; but on the contrary have seen many not in the least affected by the winter, even those that had grown the last season five or six feet from layers. We have raised them on highly manured and on poor ground. Those on the former were slightly injured in the extremities of the branches, but on the latter not at all. The White Italian Mulberry raised from seed on the above grounds, showed much greater injury from the winter.—*N. Y. Farmer.*

HOW TO DESTROY MOLES.

In the last Planter it is stated that the castor bean will destroy moles, I have tried the red Palma Christa (which some say is the same,) with success, merely by planting a few of the kernels in their paths or ploughed places; also calomel, by making holes in grains of corn, and inserting it in the holes and placing the corn in the ground for them. The calomel will not kill them till there comes a rain, when they will be found on the top of the ground.—*Southern Planter.*

PRESERVING AND PLANTING PEACH PITS.

SEEDS intended for planting should be buried in the ground immediately after the flesh is taken from them, to prevent their becoming dry, as in that case they are more sure to come up, than when they are allowed to dry and remain out of the ground until late in the fall. Whether the seeds are planted at first in the places where they are to remain, or are buried as preparatory for planting, it is important that they should be put in the ground either before they become dry, or so early in the season that they may swell again before winter, and that they should be so near the surface as to insure their being frozen, otherwise they may lie in the ground, like rose and thorn seed, one year before they will vegetate.—*N. Y. Farmer.*

MOUNT AUBURN.

This delightful place is daily visited by large numbers of gentlemen and ladies. The carriages and chaises of all, except proprietors of lots, are left at the gate while the parties promenade the grounds. Very great improvements have been made since last season, and others are in progress. The number of monuments erected, and on the ground, is very considerable, and they are seen through the trees in all directions; many of them are exceedingly neat and beautiful, and the grounds around them are laid out with much taste. In one lot the new-made grave of a child, is set round with young flowers, to bloom and die. The ponds have been neatly banked with grass, and flowering plants and shrubs set out around the borders.—*Bunker Hill Aurora.*

MASS. HORTICULTURAL SOCIETY.

An adjourned meeting of the Mass. Hort. Society was holden at their room on Saturday, June 21st, and was called to order by the Vice President.

Mr. G. W. Pratt declined serving as chairman of the committee appointed at a former meeting.

The following members were added to the committee—Z. Cook, jr. chairman; Messrs. E. Vose, M. P. Wilder, I. P. Davis, J. Lemist, J. W. Russell, B. V. French, and G. C. Barrett.

Adjourned to Saturday, June 28th, at 10 o'clock, A. M.

The following members constitute the committee to take in consideration the expediency of a public exhibition of fruit and flowers the ensuing autumn—Messrs. Z. Cook, jr. G. W. Pratt, J. P. Bradlee, W. E. Payne, J. G. Joy, Jona. Winship, D. Haggerston, S. Walker, Dr. S. A. Shurtleff, Thos. Mason, Chas. Senior, R. L. Emmons, C. M. Hovey, Wm. Kenrick, E. Vose, M. P. Wilder, I. P. Davis, I. Lemist, I. W. Runcle, B. V. French and G. C. Barrett. They are requested to meet at the rooms of the Society on Saturday 28th June, at 10 o'clock, as business of importance it is expected will come before them.

CHAS. M. HOVEY, Sec. pro tem.

FRUITS EXHIBITED.

Horticultural Hall, June 21st.

STRAWBERRIES. By E. Vose, a basket of Early Virginia.

By Thos. Hastings, East Cambridge, two boxes of Keene's Seedling.

By S. Pond, three boxes of Mulberry.

By Thomas Mason, three boxes of Royal Scarlet. By Messrs. Hovey, Keene's Seedling and Royal Scarlet.

APPLES. By E. M. Richards, a specimen of Monstrous Pippin, (kept in paper.)

For the Committee, E. M. RICHARDS.

EXHIBITION OF FLOWERS.

Saturday, June 21st.

Mr. Thos. Mason, Charlestown Vineyard—fine double Ranunculus, do. Anemonies, 2 elegant Bouquets.

Mr. S. Walker, Roxbury, Dianthus hortensis, Bow's Claudius, &c. &c., Pæonia Whitleji, Astrantia major, Hesperis double white, do. do. purple, Roses, &c. &c.

Mr. Wm. Kenrick, Newton—Pæonia Whitleji; Iris pallida, large pale violet; Hemerocallis flava, or yellow day lily; Blue Monkshood; Great flowering Chinese Larkspur; Chinese Pinks; Sweet Williams; varieties of Phlox; Sweet Rockets; Tradescantia, blue and white; Podolyria australis; Honeysuckles, Woodbines, Spireas, var. Roses, &c.

Mr. George C. Barrett, from Mr. Joseph Breck, of the Lancaster Garden—Adiantum pedatum (Maiden's hair), Gillia capitata (azure blue annual), Spiræa filipendula pleno (double Dropwort), Dianthus barbatus of sorts (Sweet William) among which was the double white; Centaurea of sorts (annuals), Delphinium sinensis (double blue), do. elatum (Ber Larkspur), Digitalis purpurea v. alba, Pæonia Whitleji, Papaver orientalis, Antirrhinum of sorts; Tradescantia, red, white, blue—this will continue to bloom every day in water; Kalnia latifolia.

Mr. Saml. Pond, Cambridgeport—fine specimens Pinks and other flowers.

Messrs. Hovey & Co.—fine double Ranunculus and other flowers.

Prof. Webster sent, to the gratification of all present, some superior specimens of double Ranunculus.

Also, was presented by Mrs. Archelaus Norcross, a fine specimen of the new and beautiful Macrophylla Rose, the first ever exhibited at the Society's rooms, and which justly excited the admiration of all amateurs present.

By order of the Committee,

JONA. WINSHIP, Chairman.

From Goodsell's Farmer.
IMPROVEMENT IN AGRICULTURE.

It is but fifteen years, since the first agricultural periodical was established in the United States.—This was the *American Farmer*, a weekly paper commenced at Baltimore in March 1819, and was continued till March last, when it was discontinued. The *New-England Farmer*, published at Boston, was next in order of time, and is now extended to the twelfth volume. These publications have had an important influence on the agriculture of those sections of country where they have been circulated and read. More recently, numerous other publications devoted to the same great object, most of them of high character, have been commenced and are still progressing. The result of all this is, that men of science and wealth have had their attention drawn to this subject; and agriculture, both as a science and an employment, has greatly improved in character; and is, we hope, soon to be advanced, in this country, to the high rank, which it has so long deservedly occupied in Europe.

The benefits resulting from agricultural publications, are becoming more and more important.—The spirit of inquiry is abroad. Scientific and well conducted experiments are constantly developing new principles in the science of physics; and the authors of new discoveries and valuable improvements are more liberal than formerly, and less reluctant to give the benefit of their experiments to the public.

There is no branch of human industry, to which science could be applied with greater benefit, than to that of husbandry; and yet there is no branch for which science has done so little. The reason is, farmers have been too negligent to avail themselves of the discoveries made by others. This they can now do at a very trifling expense.

Discoveries of new and important principles of Natural Science have been made, on which new modes of husbandry have been founded, highly beneficial in their results; but these benefits have as yet been confined to a few.

There seems but one very serious obstacle to the general diffusion of these benefits, among all classes of farmers; and that is, the want of a thorough conviction that knowledge is both power and wealth to the agriculturist, as well as to the mechanic or the professional man. The truth is, though our farmers are generally industrious, their industry is not always wisely or profitably directed.

Facts are always worth more than arguments in the search after truth, and abundantly show the value of science as the means of improvement in husbandry.

During the last twenty years, while most of our farmers have been impoverishing their lands, the application of new principles has enabled others to renovate theirs. As an instance of this, Earl Stimson, the President of the Agricultural Society, for Saratoga county, N. Y. should be honorably mentioned. He has brought into a state of almost unexampled fertility, a worn-out farm; and by a course of cultivation, particularly described in a former number of the *Farmer*, has increased his crops of corn, from 15 or 20, to 80, 100, and the last year to 150 bushels per acre—wheat, barley, and rye, from 10 or 15, to 40 or 50 bushels per acre; and hay from 1 ton to 3 1-2 and 4 tons per acre. To this statement of his crops, Mr. Stimson adds, "I know from my own experience, that it does not cost one half, if it does more than one

third as much, to raise a bushel of grain by good husbandry as it does by bad." From these facts it seems perfectly clear, that the knowledge and proper application of correct principles to practical husbandry, not only greatly increases the farmer's crop, but as greatly lessens the labor of cultivation.

Among the most important improvements of the present day, which claim the attention of agriculturists, is also that of farm-stock. That there are improved breeds, greatly superior to the common live stock of the country, and from which double the net profits may be had, with the same expense of keeping, there remains no doubt. Nor let it be said, that these breeds bear too high a price to be introduced on to the farms of New-England. The price is high, only because they are in the hands of a few enterprising individuals; the very circumstance which must render their introduction profitable to our enterprising farmers, who will undertake it.

To draw the attention of agriculturists strongly, to these various and important improvements, is all that is necessary to insure their introduction.

This subject, when rightly understood, commends itself, above all others of a mere secular nature, both to the private interest and public spirit of every class in the community; and he who shall have done most to advance these great interests of the country, will justly hereafter be considered its greatest benefactor.

From the Courant.

AGRICULTURAL.

As the season for hoeing Indian Corn approaches, the writer of this article takes the liberty of suggesting to farmers in his vicinity, a few hints relative to earthing or hilling up at the second and third hoeings, or as it is commonly called, *half hilling* and *hilling*.

The practice of most farmers within my acquaintance is, at half hilling to accumulate the earth from two to four inches, and at hilling from three to five inches more, making each hill a pyramid of about seven inches elevation. The reason offered in support of this practice is, that the corn will stand firmer and more erect, and therefore be less liable to be broken down by the wind and rain.

More than fifty years' experience in this branch of agriculture has taught me that this is erroneous both in theory and practice. By accumulating earth upon the roots of the corn they are deprived of that influence of the air and sun which are necessary to a healthy and vigorous growth.* Every one acquainted with the natural growth of this plant, must have observed the peculiar formation of the *brace roots* which sprout upon the stalk in a circular form a very little below the surface of the ground, radiating from the stalk in every direction. In like manner are the stalks of wheat, rye, barley, oats, &c. furnished with their brace roots, and stand in no need of hilling up to give them strength and firmness in their position. They are evidently designed to stay the stalk and hold it in an erect posture, not unlike the shrouds of a ship to sustain the mast. To render these braces sufficiently hard and strong to answer the design of nature, they must have the influence of the sun and air; but when buried by several

* It is well known where excavations are made in constructing canals and rail roads, and the earth to any considerable depth thrown upon the roots of large and healthy trees, it causes their death within a year or two, by placing their roots below the influence of the air, and warmth of the sun—the same effect is produced, and from the same cause, where timber land is flooded by water.

inches of superincumbent earth, they become soft, weak, and brittle, and nature to remedy this evil sends out another set above the former. This occasion an unnecessary waste of the nourishment of the plant, and at that advanced season of the year never become sufficiently indurated to perform their office to the best advantage.

If those farmers who may take the trouble of reading this article, should doubt the correctness of this reasoning, they are respectfully invited to test it by experiment upon a few rows or hills. For many years past the writer has practised upon the principles here recommended, and has uniformly been successful in his crop.

It may also be remarked that great injury is done both by the plough and the hoe at the time of hilling, by breaking and wounding the long fibrous roots so necessary to the growth and strength of the stalk. After the weeding or first hoeing, neither the plough or the hoe should be allowed to penetrate any deeper than is necessary to destroy the weeds and grass.

In cultivating the potato, the same reasoning so far as it respects the accumulation of earth, will apply—the bulb is formed simultaneously with the blossom bud. If, after that period there be much *hilling* up, the first formed bulbs grow but little; being out of the reach of that warmth and air which are required for a perfect growth, and another set above them is produced. Hence it is that by this mode of culture so great a proportion of the crop consists of small bulbs. Every cultivator must have observed that the largest potatoes in the hill are invariably found near the surface of the ground.

CORNPLANTER.

From the Baltimore Farmer.

PASTURING WHEAT.

PASTURING wheat closely, in the spring of the year, has been often practised to advantage in destroying the fly. It is now too late in the season to practise that method this year. If farmers would early examine their wheat, and when the fly is found committing its ravages, would turn in their stock and pasture it down closely, they would frequently save their crops. This insect deposits its eggs between the stalk and first leaf, near the root;—as the larva approaches to maturity, and increases in size, it exudes a poisonous moisture from the external covering of the larva, which causes the stalk to sphacelate; and by the increased bulk, pressing between the leaf and stalk, it obstructs the free circulation of the sap, and prevents a sufficient supply for the nourishment of the head and grain. By the disease caused in the stalk immediately in contact with the larva, the stalk is frequently broken off, and falls.

By pasturing closely, at the proper season of the year, which by the account below, corroborated by my own experience, may be as late as the 21st of May, the egg or young larva will be destroyed; and at the same time, according to the laws of vegetation, the cutting off the tops of the wheat will cause new lateral shoots, which will have no flies in them; and the roots spreading, as is always occasioned by cutting the tops, a greater supply of nourishment will be afforded to the grain.

Farmers are generally induced to sow late in consequence of the ravages of the fly in early sowed grain;—but it is worthy of their consideration, whether it would not be better to sow early and to sow less, manure more, and to have a fine pasture early in the spring, when all supply of

fodder is short; to fatten sheep, raise up poor horses, young calves, and to furnish a plentiful supply of good yellow butter for the market, at this season of the year, when it now wears such a pale, corn-stalk hue, and tastes so strongly of silver, that we poor citizens can hardly relish the taste of it.—

"To the Agricultural Society of Stark County, and Farmers generally.

The destruction of the wheat crops in this section of the country by the late severe frosts, it is presumed has been discovered by every observing wheat farmer, but if any are not apprised that their wheat is destroyed, and suppose it is safe because their fields appear green and vigorous, I would direct them to examine the inner part of the stem immediately above each joint, first divesting the stem of its double covering, and if they find the tender part of the stem, (which in a healthy state, easily separates from the joint,) is of a deep green color, all such stems I would pronounce destroyed; that although they will for some time imbibe the sap and nourishment from the root, they will perish without producing a head; therefore, that the root may not be exhausted by throwing its nourishment into the present stem, and give it an opportunity sooner to throw out new shoots, which will come forth about the same time, I am cutting wheat as near the ground as I can with the scythe. The success of this plan to save the crop is strongly supported by the following fact: On the evening of the 21st day of May, 1816, I arrived on my farm in this vicinity from the South with 200 head of cattle: on that night the whole number broke into my wheat-field, passed over two or three acres of it, and being hungry and fatigued, devoured all, bare to the ground, as far as they went. This part of the field I considered entirely lost, but it soon put forth shoots from the roots, and grew up an even and uniform crop: and now I must crave the indulgence of farmers, and particularly those who do not know me, when I state the fact that that which was eaten down, produced as good a crop or better in the opinion of some who were employed in harvesting it, than that part of the field which had not been eaten down, and though perhaps not quite so ripe was cut with the other part of the field.

The wheat that is frozen will put out shoots from the roots, whether we cut it or not; but if not, they will put out, grow up, and ripen unequally, for they will only put out as the old stock decays, and consequently will be later than when it is removed.

JOHN MYERS.

Canton, (Ohio,) 21st of May, 1834."

ON THE CULTURE OF CLOVER.

Few things have contributed more largely to the modern improvement of husbandry, than the introduction of clover in connexion with the rotation of crops. This plant serves to ameliorate and fertilize the soil, and at the same time it affords an abundance of wholesome food for every description of farm stock. Whether cut for winter stores, for soiling in the yard, or fed off by stock, but few crops surpass it in the quantity of cattle food which it affords. Although cultivated in Holland and Flanders from an early period, with great advantage, it was not introduced into Great Britain till the 16th century. At present, clovers enter largely into the succession of crops there, on all soils, and in every productive course of manage-

ment. They are principally instrumental in giving to Flanders its high celebrity as an agricultural country, greatly in advance, in improvement, of the states around it. The clover system has converted some of the poorest districts in England, into the most productive and profitable. In the United States it is comparatively of recent introduction; and even at this day its benefits are but partially appreciated or applied as they ought to be. In connexion with gypsum, clover first became a subject of notice and culture in the counties about Philadelphia, and in the county of Dutchess, some forty years ago; and we are much indebted to the example and writings of Chancellor Livingston, Judge Peters, and other gentlemen of learning, wealth and enterprise, for the improvement and wealth which it has conferred on our land. Many of our farmers have yet much to learn, before they can realize the full benefits which it is capable of affording in the profits of the farm. Although botanists enumerate nearly fifty species of the clover family, our present remarks are intended to apply merely to the common red kind (*trifolium pratense*).

There are three faults in the management of clover which we design briefly to notice in reference to alternate husbandry. Two of these are:

1. *Too little seed is usually sown.* The object of the clover crop is to procure a cheap food for animals and plants. Few if any crops surpass it in the quantity which it affords of these—and few exhaust the fertility of the soil less.—One farmer sows four to six pounds of seed to the acre, and gets in return a thin but coarse crop of hay or pasture.—Another sows ten to fourteen pounds, obtains double the burthen of the first, and at a trifling extra expense of less than a dollar to the acre for seed, while his land is doubly benefitted by the green crop to be ploughed in. From ten to fourteen pounds of seed should be sown to the acre, whether the object is to benefit the stock or the land. The product will be somewhat in the ratio of the seed sown; and the advantages of heavy stocking both in the hay and to the soil, will far outbalance the cost of the extra seed.

2. *Clover lays are permitted to remain too long before they are brought under the plough.* The common clover is a biennial, or at most a triennial plant; and if not ploughed under before the third year, its advantages to the soil, as a green crop are mostly, or wholly lost; while after the second year it adds very little to the crop of hay. But if turned under the first or second year, it furnishes to the soil a great quantity of vegetable matter, the true food of plants. It not only serves as a manure, but it benefits mechanically. Its tap roots penetrate and divide the soil, and as they decay render it friable, and permeable to heat, air, and moisture. A well set clover lay imparts to the soil as much benefit, in our opinion, as ten loads of yard manure to the acre. When a broadcast crop is to be followed by a tillage crop, as corn, potatoes, or small grain, there is manifestly a decided advantage in stocking it with clover, though it is to be turned under the ensuing fall or spring. We estimate its value as manure, to say nothing of the pasture which it affords, at from five to ten dollars per acre, while the cost of the seed does not ordinarily exceed one dollar. I have sown rye and clover, upon a piece of poor sandy land, for which I had no manure to spare, three years in succession with manifest advantage.

—*Albany Cultivator.*

DISEASES OF HOGS.

I am engaged in milling, and have kept a stock of about three hundred hogs in a large frame pen divided into twenty-four rooms, with plank floor, and lodging rooms covered and boarded, leaving open only sufficient room for them to enter. They had been fed on bran, shorts, and coarse middlings. I have lost during the last winter, about fifty—many of them were fat, and would weigh two hundred when dressed.

They are taken with weakness in the back, and lose the use of their hind parts—generally live from two to three weeks. On opening them have always found a great many slim worms, about an inch long in the leaf, and about the back bone. I have tried all medicines recommended by farmers in this section, and in no instance had a cure.

I have a neighbor, who purchased a drove last fall, and has given them seven hundred dollars worth of corn, and the stock now left are not worth the first cost in consequence of the same disease.

You, or your correspondents will confer a favor by giving me such information as you or they possess respecting a remedy.

Yours, respectfully, R. H. H.
Venice, Huron co., Ohio, April 2.

PRESERVING BACON.

THERE is much said about preserving bacon. I have noticed in all the communications on the subject, that it is recommended to have the bacon well dried; and I think this is the principal thing required. If bacon is not well dried, there is nothing that it can be packed in, that will keep it sound. When bacon is hung up for drying, boards or plank should be laid on the joints over it, in order to keep dirt or dust from falling on it, also to keep the smoke from escaping too soon. A smoke should be kept under it till it is thoroughly dry, and be continued in wet weather in the summer. Whoever will follow this plan will save their bacon.—*Southern Planter.*

From the New London Gazette.
COWS.

THE following statement of the cost, expense and the avails of a Cow for 14 months, made by a gentleman of this city, who has been a practical farmer, and who is no bad calculator, shows how profitable Cows may be with proper management. A farm of 100 acres, by such calculation and management as stated below, supposing it kept only twelve cows, would afford an annual income of at least \$1600.

| | |
|---|----------|
| Dr.—Cost of Cow and Calf, | \$20 |
| Paid for Pasturage, | 15 |
| 1½ tons Hay, at \$15, | 22 50 |

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JUNE 25, 1834.

HEALTH AND CLEANLINESS.

In our last (page 398), we gave some remarks on the importance of pure air and pure water as indispensable to health, and the methods by which farmers may best convert the poisonous gases, which emanate from manure heaps, &c. into food for plants. Since writing that article, we have had our attention directed to an essay in the *Companion to the British Almanac*, which relates in part, to the same subjects, but does not fall immediately nor exclusively under the cognizance, nor within the province of the cultivator. But, as every human being has a direct and all important interest in these topics, we shall make no apology for the following extract as a substitute for less valuable matter of our own fabrication.

We are all thoroughly aware of the necessity of breathing; and the agreeable freshness and reviving influence of the pure morning air must convince us that the breathing a pure atmosphere is conducive to health; yet we as carefully exclude the air from our houses as if its approach were noxious. Intending to shut out the inclemencies of the weather only, in our care to guard ourselves against the external air, we hinder that renewal of the atmosphere, which is necessary to prevent its becoming stagnant and unfit to support animal life.

Few persons are aware how very necessary a thorough ventilation is to the preservation of health. We preserve life without food for a considerable time, but keep us without air for a very few minutes, and we cease to exist. It is not enough that we have air, we must have *fresh air*; for the principle by which life is supported is taken from the air during the act of breathing. One fourth only of the atmosphere is capable of supporting life; the remainder serves to dilute the pure vital air, and render it more fit to be respired. A full grown man takes into his lungs nearly a pint of air each time he breathes; and when at rest he makes about twenty inspirations in a minute. In the lungs, by an appropriate apparatus, the air is exposed to the action of the blood, which changes its purer part, the vital air (oxygen gas), into fixed air (carbonic acid gas), which is not only unfit to support animal life, but absolutely destructive of it. An admirable provision of the great Author of nature is here visible, to prevent this exhausted and now poisonous air from being breathed a second time:—while in the lungs the air receives so much heat as makes it specifically lighter than the pure atmosphere; it consequently rises above our heads during the short pause between throwing out the breath and drawing it in again, and thus secures to us a pure draught. By the care we take to shut out the external air from our houses, we prevent the escape of the deteriorated air, and condemn ourselves to breathe over again the same contaminated unrefreshing atmosphere.

Who that has ever felt the refreshing effects of the morning air can wonder at the lassitude and disease that follow the continual breathing of the pestiferous atmosphere of crowded or ill ventilated apartments. It is only necessary to observe the countenances of those who inhabit close rooms and houses, the squalid hue of their skins, their sunken eyes, and their languid movements, to be sensible of the bad effects of shutting out the external air.

Besides the contamination of the air from being breathed, there are other matters which tend to depreciate its purity; these are the effluvia constantly passing off from the surface of animal bodies, and the combustion of candles and other burning substances. On going into a bed room in a morning, soon after the occupant has left his bed, though he be in perfect health, and habitually cleanly in his person, the sense of smelling never fails to be offended with the odor of animal effluvia, with which the atmosphere is charged. There is another case still more striking, when a person fresh from the morning air enters a coach in which several persons have been close-stowed during a long night. He who has once made the experiment will never voluntarily repeat it. The simple expedient of keeping down both windows but a single half inch would prevent many of the colds, and even fevers, which this injurious mode of travelling often produces. Outside passengers, though they may suffer a little more from cold and wet, generally escape those every day complaints of those who pay double their fare. If under such circumstances the air is vitiated, how much more injuriously must its quality be depreciated, when several persons are confined to one room, where there is an utter neglect of cleanliness; in which cooking, washing and all other domestic affairs are necessarily performed; where the windows are immovable, and the door is never opened but while some one is passing through it! On entering such a den of filth, the nose is saluted by a stench so horrible, as to make any person unused to it, recoil and pause before he ventures in; but the wretched inhabitant has his sense of smelling so blunted that he does not perceive that, with every breath he takes, he inhales a poison, which is sapping the vigor of his body, and destroying the energies of his mind.

A constant renewal of the air is absolutely necessary to its purity; for in all situations it is suffering either by its vital part being absorbed, or by impure vapors being disengaged and dispersed through it. *Ventilation therefore, resolves itself into securing of a constant supply of fresh air.*

In the construction of houses, especially in those built for the poor, this great object has been too generally overlooked, when, by a little contrivance in the arrangement of windows, and doors, a current of air might, at any time be made to pervade every room of a house of any dimensions. Rooms cannot well be ventilated that have no outlet for the air; for this reason there should be a chimney to every apartment. The windows should be capable of being opened, and they should if possible be situated on the side of the room opposite to and furthest from the fireplace, that the air may traverse the whole space of the apartment in its way to the chimney.

Fire places in bedrooms should not be stopped up with chimney boards. The windows should be thrown open for some hours every day, to carry off the animal effluvia, which are necessarily separating from the bed clothes, and which should be assisted in their escape by the bed being shaken up, and the clothes spread abroad, in which state they should remain as long as possible; this is the reverse of the usual practice of making the bed, as it is called in the morning, and tucking it up close as with the determination to prevent any purification from taking place. Attention to this direction with regard to airing the bedclothes and bed after being slept in is of the

greatest importance to persons of weak health. Instances have been known in which restlessness and inability to find refreshment from sleep would come on in such individuals, when the linen of their beds had been unchanged for eight or ten days. In one case of a gentleman of very irritable habit, who suffered from excessive perspiration during the night, and who had taken much medicine without relief, he observed that for two or three nights after he had fresh sheets put upon his bed, he had no sweating; and that after that time he never awoke, but that he was literally swimming; and that the sweats seemed to increase with the length of time he slept in the same sheets. By not permitting him to sleep in the same sheets or night clothes more than twice without their being washed, he instantly lost his debilitating affection.

ITEMS OF INTELLIGENCE.

☞ *The Death of the venerable and illustrious GENERAL LAFAYETTE occurred on the morning of the 20th of May last. He was born 1st Sept. 1757.*

We learn from the National Intelligencer, that a message was on Wednesday transmitted to Congress by the President of the United States, communicating official information of the unfortunate accident at Toulon. It appears that three of the guns of the Frigate United States had been inadvertently left shotted, all of which were discharged during the salute, and most of them directly into the French ship of the line Suffren, by which two men were killed and two wounded. The President recommends to Congress that pensions be authorized for the families of the unfortunate victims of the accident.—*Mer. Journal.*

Foreign. Richard Lander who discovered the mouth of the Niger, and who accompanied the late trading expedition up that river, is said to have been murdered by the natives at a place two or three hundred miles up that river.—A treaty, it is now believed was signed at London on the 22d of April, between England, France, and Spain, to bring about a settlement of the affairs of the Peninsula. The Queen of Spain to send an army to Portugal, Miguel and Don Carlos to be excluded. England to furnish a naval force if necessary. News had been received at Lisbon of the entry of a Spanish army of 10,000 into Portugal. Parliament had voted decidedly against Mr. O'Connell's proposition to repeal the Union bill—majority 480.

The Planet Jupiter. Professor Airy, by a very masterly process has determined the mass of Jupiter, by observations of the elongations of the fourth satellite, and he has proved that the magnitude assigned by Laplace is erroneous, and finds that the mass of Jupiter is more than 323 times that of the earth, being the 1048-69th part of that of the sun; a truly valuable result in physical astronomy.—*White's Ephemeris for 1834.*

Frost. There was a heavy frost in this place on the night of Saturday last, which did much damage in the gardens and fields. Corn, beans, cucumbers, &c. are entirely cut down in many places. Some persons have been through their fields with shears, and clipp the corn even with the ground—others are planting again. Grass and English grains generally, look promising. Notwithstanding these "nipping frosts" retard the labors of the husbandman, and render his prospects of an Indian corn crop extremely dubious, he has the assurance that seed time and harvest shall never fail, and has no reason to distrust the goodness of Him who watereth the hills from his chambers, and satisfieth the earth with his works.—*Newport, N. H.*

David Sherman (who got drunk with cider brandy and murdered his wife) was executed on Friday last.

Birds. An English writer estimates the quantity of worms destroyed by 10,000 rooks annually, at 200 tons. The 10,000 are on one estate. The damage done by birds is comparatively nothing to the benefits conferred by them in the destruction of mischievous insects; and the experience of agriculturists has shown that crusades against birds have always been followed by the devastations of insects. Granting a bounty for the destruction of the agents that nature has provided to keep insects in check, is entering into a treaty with the husbandman's worst enemies, and granting indemnity to predators infinitely worse than birds can possibly be.—*Bost. Galaxy.*

Cruelty. A person was arraigned before Wm. N. Green, Esq. in this village, on Saturday last, on charge of cruelly and inhumanly beating a yoke of oxen which were in his care. After an investigation, the magistrate not having final jurisdiction in such cases, he was ordered to give bail in the sum of \$100, for his appearance to answer to said charge, at the next term of the Court of Common Pleas.—*Worcester Spy.*

Spanish Horror of Drunkenness. In ancient days there was a law in Spain which decreed that if a gentleman was convicted of even a capital offence, he should be pardoned on pleading his having been intoxicated at the time he committed it; it being supposed that any one who bore the character of gentility, would more readily suffer death, than confess himself capable of so beastly vice as drunkenness.

Burden's Steamboat. An experimental trip was made yesterday afternoon with Mr. Burden's new steamboat, the result of which was very satisfactory. A person who was on board, thinks she went twice as fast as a common steamboat. She is not yet finished.—*N. Y. Jour. of Commerce.*

A Fleet. On Saturday afternoon at 5 o'clock, no less than thirteen steamboats started for Albany and the intermediate places—several of them with two and three tow boats attached. They were the Constellation, Constitution, De Witt Clinton, Victory, New London, Fanny, United States, Swiftsure, &c. &c. The Hudson river smoked like a tavern bar-room.—*N. Y. Jour. Com.*

A Good Fleece. Mr. George W. Leonard, of Talbot County, Md. sheared this spring from six sheep, forty-two pounds of clean washed wool; making an average of seven pounds to each sheep. Three or four pounds we believe is a common average.—*Easton Gazette.*

FRUIT TREES.

ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, $\frac{5}{8}$ miles from Boston by the City Mills, and $\frac{1}{4}$ a mile from the Worcester Rail Road.

A rare collection of Fruit trees, Trees and shrubs of ornament, Roses, Dahlias, &c. This Nursery now covers compactly, the most part of 18 acres; and includes of Trees and plants in different stages of growth, from two to three hundred thousand. Of new celebrated Pears alone, 450 kinds, a part of which having been already proved in our climate, are especially recommended. Of Peaches, a Capital Collection, for extensive numbers and fine kinds—Apples—Cherries—Plums—Nectarines—Apricots—Almonds—Quinces—Grape Vines—Currants—Raspberries—Gooseberries—Strawberries—Figs, &c.—Selections from the best varieties known.

MORUS MULTICAULIS, or NEW CHINESE MULBERRY, so celebrated for the food of silkworms.

OF ROSES. A superb collection of from 300 to 400 hardy and China varieties; from numerous importations, and first rate sources. White Flowering Horse Chestnuts, Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees and shrubs, 650 varieties. Of Herbaceous flowering Plants, 300 choice varieties, including the finest kinds of Peonies, and 100 splendid varieties of Double Dahlias.

Gentlemen are invited to forward their orders early in Autumn, being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed, and from thence when ordered duly forwarded, by land or sea. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Je 25

DISHLEY, OR NEW LEICESTER SHEEP.

Two Rams and one Ewe, with her Ewe Lamb of four months old, of the pure breed as above—were imported from England last year from one of the most celebrated flocks, superior as a large mutton breed, and also very heavy fleeces of long combing or worsted wool.

Also, a very fine, 3 year old Bull, 3-4 blood Durham Short Horn.

Apply to JOHN PRINCE.
Jaimaca Plains, June 25th, 1834.

GRINDSTONES ON FRICTION ROLLERS.

Grindstones of different sizes hung on Friction Rollers and moved with a treader, is found to be a great improvement on the mode of hanging grindstones, the ease with which they move upon the rollers renders them very easy to turn with the foot, by which the labor of one man is saved and the person in the act of grinding can govern the stone more to his mind by having the complete control of his work.

The above Stones may be found of a very superior kind, and hung completely as above described at the Agricultural Warehouse, 51 & 52 North Market street. je 18

TURNIP SEED.

For Sale at the N. E. Seed Store, 51 and 52 North Market street, Early Dutch Turnip, Early Garden Stone ditto, Yellow Stone do.; White Flat Winter do.; Long Yellow French do.; Yellow Aberdeen do.; Ruta Baga do.

The two last are excellent kinds for Cattle. je 18

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

1 Case wet (but not damaged) Bishops Lawn.
1 do. do. do. Book Muslin.
Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation. m 14

STRAW CARPETING.

ELIAB STONE BREWER, No. 414 Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table matts. istf. a 16.

BRASS SYRINGES.

Just received at the Agricultural Warehouse, a good assortment of Willis's improved Brass SYRINGES for Green Houses, Grape Vines, &c. &c.—see Complete Farmer, page 345. je 4 J. R. NEWELL.

ZINC WARE.

Just received, a further supply of Zinc Milk Pans, Kettles and deep Bake Pans, and for sale at the Agricultural Warehouse, No. 51 and 52 North Market Street.

The manufacturers of this article having closed their works, no more of them can be procured at present,—and as the season is at hand when these are most wanted, and as they are found on trial to produce a great increase of Milk, they are highly recommended to the public as one of the improvements of the day. my 14

BOX PLANTS.

From Seven Hundred to One Thousand Yards of Prime BOX in good order for Planting. To be taken up at any time when ordered. Orders may be left with GEO. C. BARRETT, New England Farmer Office, or apply to THOMAS MASON, Charlestown Vineyard. It may be had on fair terms by the Yard or Hundred. m 7

WHITE DUTCH CLOVER.

RECEIVED this week direct from Holland 1000 lbs. superior White CLOVER, warranted free from any kind of foul seed, and at least worth one third more than American. This will be found an excellent Grass for Pasture land, &c. a 16 GEO. C. BARRETT, New England Seed Store.

BOSTON TRUSS MANUFACTORY.

JAMES P. FOSTER, Successor to the late John Beath, at the sign of the Eagle and Truss, No. 393 Washington street. Trusses made to order and fitted to the patient. All sorts of repairing done to Trusses in the best manner.

Among the variety of Trusses made and sold by J. F. Foster, are Patent Elastic Spring Trusses, with Spring Pads—Trusses without steel springs. These give relief in all cases of rupture, and in a large portion produce a perfect cure. They can be worn day and night. Improved Hinge and Pivot Trusses, Umbilical Spring Trusses, and Trusses with ball and socket joints.

Suspensory Trusses for individuals troubled with Hydrocele are always kept on hand, together with all the other kinds made by Mr. Beath, formerly.

The former friends and customers of Mr. Beath are respectfully invited to call as above, where they will be faithfully and personally attended to by Mr. FOSTER. LYDIA BEATH.

N. B. Ladies wishing for either Trusses or Backboards will be waited upon by Mrs. Beath, at her residence, 585 Washington street. L. B.

BRIGHTON MARKET.—MONDAY, June 23, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 322 Beef Cattle, (including 50 unsold last week); 710 sheep; 18 cows and calves, and 150 swine.

PRICES. Beef Cattle—The cattle generally were not of so good a quality as last week, but about the prices were obtained for the goodness. We quote prime at 6; good at 5 25; thin at 4 50 a 5.

Cows and Calves—We noticed sales at 23, 25, 27, 30, and \$40.

Sheep—We did not obtain sufficient knowledge to give prices.

Swine—Most of those at market were small, and were sold without weighing.

MISCELLANY.

MORNING.

BY GEORGE D. PRENTICE.

How sweet the landscape! Morning twines
Her tresses round the brow of Day,
And bright mists o'er the forest pines,
Like happy Spirits, float away
To revel on the mountain's crown,
Whence the glad stream comes shouting down,
Through woods and rocks, that hang on high,
Like clouds against the deep blue sky.

The woven sounds of bird and stream,
Are falling beautiful and deep
Upon the spirit, like a dream
Of music in the hour of sleep—
And gently from the dewy bowers,
Soft murmurs, like the breath of flowers,
Are winding through the purple grove,
And blending with the notes of Lova.

The streams in veins of silver flow—
The sunrise gale o'er flower and tree
So lightly breathes, it scarce would blow
A fairy bark upon the sea—
It comes so fresh, so calm, so sweet,
It draws the heart from its retreat,
To mingle in the glories born
In the first holy light of morn.

A cloud is on the sky above—
And calmly, o'er the young year blue,
'Tis coming like a thing of Love
To gladden in the rising dew—
Its white waves with the sunlight blend,
And gentle spirits seem to bend,
From its unrolling folds, to hear
The glad sounds of our joyous sphere.

The lake unruffled by the breeze,
Smiles in its deep, unbroken rest,
As it were dreaming of the trees
And blossoms pictured on its breast;
Its depths are glowing, bright and fair,
And the far skies seem hallowed there,
Soft, trembling, as they felt the thrill
Of music echoed from the hill.

The living soul of beauty fills
The air with glorious visions—bright
They linger round the sunny hills
And wander in the clear blue light—
Off to the breathing heavens they go,
Along the earth they live and glow,
Shed o'er the lake their happy smiles,
And beckon to its glittering isles.
Oh, at this hour, when air and earth
Are gushing love, and joy, and light,
And songs of gladness at the birth
Of all that's beautiful and bright—
Each heart beats high—each thought is blown
To flame—the spirit drinks the tone
Of brighter worlds, and melts away
In visions of eternal day.

From the Tracts and Lyceum.

THE WHIPPOORWILL.

HAVING never seen any particular account of the habits of the *whippoorwill*, and being under the impression that they are not well known, I thought the following remarks might be interesting to some.

The peculiar cry of this singular bird, which resounds in all our groves during the early summer evenings, is familiar to every one; but its object in making this cry, is perhaps known to few among the acquaintances of this nocturnal visitor.

It seems that it is the call of the bird to its mate.—Having lived where they came nightly to the very door, I have had a good opportunity to watch their habits, as far as the dusk of twilight would permit.—After the call of the whippoor-

will had been repeated for sometime, another individual would frequently arrive, and then it ceased. There was then heard a kind of croaking in a low and subdued tone, or else a clucking, with intervals of over a second between each note.

From these circumstances, we have good reason to believe that the cause assigned is the true one. From the apparently solitary habits of the bird, and the time at which it comes out from its solitudes of the forest, it would seem necessary that the bird should have some means of indicating its place to its mate.

A similar provision is assigned to the glow-worm, whose winged partner would with difficulty find its creeping consort, were it not thus provided; and this is no doubt the use of the flickering taper of the fire-fly, which we all have loved from our childhood.

The whippoorwill begins to sing about the first of May, but is not much heard till near the middle. His song gradually dies away in June, and by midsummer he is hardly to be heard. He is one of our most singular birds, and, I think peculiar to our country. ORNUS.

IMMENSITY OF SPACE.

Far as the earth seems to be from the sun, it is near to him when compared with Uranus; that planet is no less than 1843,000,000 of miles from the luminary that warms and enlivens the world; situated on the verge of the system, the sun must appear to it not much larger than Venus does to us. The earth cannot even be visible as a telescopic object to a body so remote; yet man, the inhabitant of the earth, soars beyond the vast dimensions of the system to which his planet belongs, and assumes the diameter of its orbit as the base of a triangle, whose apex extends to the stars. Sublime as the idea is, this assumption proves ineffectual, for the apparent places of the fixed stars are not sensibly changed by the earth's annual revolution; and with the aid derived from the refinements of modern astronomy, and of the most perfect of instruments, it is still a matter of doubt whether a sensible parallax has been detected even in the nearest of these remote suns. If a fixed star had the parallax of one second, its distance from the sun would be 20,500,000,000,000 of miles. At such a distance not only the terrestrial orbit shrinks to a point, but the whole solar system, seen in the focus of the most powerful telescope, might be covered by the thickness of a spider's thread. Light flying at the rate of 200,000 miles in a second, would take three years and seventy days to travel over that space; one of the nearest stars may, therefore, have been kindled or extinguished more than three years, before we could have been aware of so mighty an event. But this distance must be small when compared with that of the most remote of the bodies which are visible in the heavens. The fixed stars are undoubtedly luminous like the sun; it is, therefore, probable that they are not nearer to one another, than the sun is to the nearest part of them. In the Milky Way and the other starry nebulae, some of the stars that seem to us to be close to others may be far behind them in the boundless depth of space; nay, be rationally supposed to be situated many thousand times further off; light would therefore require thousands of years to come to the earth from those myriads of suns, of which our own is but "the dim and remote companion."—Mrs. Somerville.

UNWISE MEN.

The angry man—who sets his own house on fire, in order that he may burn up that of his neighbor.

The envious man—who cannot enjoy life because others do.

The robber—who for the consideration of a few dollars, gives the world a right to hang him.

The hypochondriac—whose highest happiness consists in rendering himself miserable.

The jealous man—who poisons his own banquet and then eats of it.

The miser—who starves himself to death, in order that his heir may feast.

The slanderer—who tell tales for the sake of giving his enemy an opportunity to prove him a liar.

VALUABLE NEW WORK ON AGRICULTURE.

This day Published, by GEO. C. BARRETT, at the Office of the N. E. Farmer.—The COMPLETE FARMER and RURAL ECONOMIST, By THOS. G. FESSENDEN, Esq.

Containing a compendious epitome of the most important branches of Agriculture and Rural Economy, and the following subjects arranged in order:

| | | | |
|--------------|---------|----------------|-----------------|
| Soils, | Wheat, | Beans, | Mangel Wurtzel, |
| Grasses, | Rye, | Swine, | Ruta Baga, |
| Grain, | Oats, | Lime & Gypsum, | Potatoes, |
| Neat Cattle, | Barley, | Fences, | Haymaking, |
| Barns, | Millet, | Hedges, | Ploughing, |
| Dairy, | Hops, | Sheep, | Poultry, |
| Hemp, | Peas, | Horses, | Wood: |
| Flax, | | | |

and to which is added—Descriptions of the most approved implements and Machines, with Engravings.

The work is printed on the best of paper, and is intended for a Farmer's Directory, which every farmer should be possessed of, and relying upon an extensive sale will be afforded at the low price of \$1.

[From the New England Magazine of June 1st, 1834.]

All men love a farm and a garden, and Mr. Fessenden is better qualified than any other man in New-England to compose a good work on these practical subjects—albeit he was in his youth addicted to the less profitable pursuits of wit and poetry. This work should be on the shelf of every farmer's library: there is much in it to guide him and nothing to lead him astray. All is practical, nothing is speculative. It embraces the entire transactions of a farm. The materials for the work must have been collected through many years. Excellence is comparative—and any traveller in England may there best notice the defects of American husbandry. Still, however, it is with caution that in our soil and climate we should adopt the English modes of cultivation.

The soils are first treated of, then grasses, grain, cattle, and animals, dairy, manures, harvesting, poultry, implements, &c. &c.

Those who would have a choice of implements may choose among many at the New-England Agricultural Warehouse. Here is every facility for saving labor and increasing crops; and the implements that are not useful—if any such there be—are studies of ingenuity. All are made in the best manner, and they are in some sort an illustration of Mr. Fessenden's book, many being neatly delineated in it.

THE NEW ENGLAND FARMER.

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

[No paper will be sent to a distance without payment being made in advance.]

NEW ENGLAND FARMER.

PUBLISHED BY GEO. C. BARRETT, NO. 52, NORTH MARKET STREET, (AT THE AGRICULTURAL WAREHOUSE.)—T. G. FESSENDEN, EDITOR.

VOL. XII.

BOSTON, WEDNESDAY EVENING, JULY 2, 1834.

NO. 51.

COMMUNICATIONS.

For the New-England Farmer.

I HAVE taken great pleasure in visiting, occasionally, the Hall of the Horticultural Society, and regret that my grounds are too extensive to admit, with what leisure is permitted me, the indulgence of more frequent contribution to those beautiful displays of Fruits and Flowers that delight the senses, and shed a perfume like "Araby the blest."

I feel, and I trust it is common to all, much obliged by the exertions, labor and spirit of the Society, of which I have the honor to be a too useless member. I, however, find it necessary to state that I had the good fortune to raise from a potato of the "Old fashioned Red," well known to ancient Farmers, one that weighed over 43 ounces. This was lately had from Maine. It would be grateful indeed to find a renewal of this, and of the cranberry, &c. formerly so much esteemed. I thought this "apple of the earth" quite worth notice, more especially as it exceeded the weight of the Long Red, according to the subjoined account, published by the Philadelphia Society for Promoting Agriculture.

My "Pomme de Terre," however, was smothered in the perfume of Dahlias, Geraniums, &c. and it is presumed wilted and "died of a rose in aromatic pain," and I am compelled to give this obituary notice that it *once was*, and attained this size.

Yours, &c. A DORCHESTER FARMER.

To the President of the Philadelphia Agricultural Society.
ON THE LONG RED POTATO.

I herewith send samples of some potatoes, denominated the "Long Red." The potatoes, in the opinion of some are very good for the table. I believe them equally valuable for stock, and on account of their prodigious yield, think them well worth the attention of agriculturists generally. Some of the samples, when first taken from the ground last fall, weighed from 2 lbs. to 2 lbs. 9 oz.

With respect, thy friend, ISAAC C. JONES.

By the Editor. We trust our Readers will be pleased with the playful remarks of "A Dorchester Farmer." They furnish a good humored hint on an important subject of production, which is made, by the facts now connected with it, quite interesting to the agriculturist.

For the New England Farmer.

MANURING CORN IN THE HILL.

MR. EDITOR—Sir, Noticing the opinion of a writer in the Genesee Farmer, as quoted in the New England Farmer of 4th inst. on the subject of manuring corn in the hill, as being injudicious and unprofitable, and stating his reason for the opinion that the plant derived its nourishment from its fibrous roots, and that the manure would not benefit the plant after its roots had extended beyond the circle where it was deposited, and that it was said they would extend to the height of the stalk above ground, and that if the season was dry they would fire fang, &c.

I cannot acquiesce in the writer's opinion, having studied the practical science of Agriculture many years, I find I am very deficient in that noble and useful science—I beg to know if the

writer's opinion applies to the general soils on which we grow corn. I am in favor of manuring in the hill, and feel persuaded if the operations are performed with judgment and skill, it will produce the best corn, both in quantity and quality. I am induced to give my practice in hope of obtaining information and correction if erring.

Early in the spring I trench plough a piece of sod ground, cutting the sod with a sharp coultter and share as thin as possible, which falls into the trench; another plough follows in the same furrow, ploughing deep and covering up the sod with soil (on which the sun has never shed its rays). As soon as the surface has received the frost, it is well harrowed down.

At the time for planting I furrow out the land three and a half feet apart both ways, with a yoke of oxen, furrowing deep to deposit the manure, putting a good shovel or dung fork full to each hill, on which I throw three times the usual quantity of seed (selecting the finest plants at the first hoeing). It is unnecessary to draw mould on the manure before the seed is deposited, but particular attention must be paid that the manure is not doubled on the seed, but covered with some fine mould with the hoe, being very careful to cover up all the dung with the soil, the gentle heat from the manure will cause the corn to spring up quick, a strong plant, and by its gradual decomposition feed the centre of its roots, which will force through the manure into the sod below and send forth its fibres with vigor and cause the plant to grow luxuriantly until it arrives to maturity. On examining the hill at corn harvest, very little of the manure can be found, consequently no fire fang is likely to take place if judiciously managed. Any information on the subject will be kindly received by

A SUBSCRIBER.

Billfield Farm, Hyde Park, Dutchess Co.

By the Editor. We believe that the expediency of Trench-ploughing, and manuring Indian corn in the hill depends on circumstances, which have been thus explained by Dr. Deane:

Trench Ploughing. "In old countries, where lands have been ploughed for a thousand years, the rich black soil has been growing deeper and deeper. So that trench ploughing by this time may be very proper in many of their fields; and even necessary to bring up the strength of manures which had subsided to a greater depth than common ploughing reaches.

"But there is only a small proportion of our land in this country, to which trench ploughing is suitable, or which will well pay the cost of it. In most of our soils, even where the hard under stratum or pan lies deep, trench ploughing would throw up so much cold hungry earth, and bury the upper mould so deep as to render the land very barren at first. The places where it would answer best, are hollows, into which much vegetable mould has been washed down from the neighboring heights, which has a black moory soil to a great depth; and such spots as have been used as gardens, and have been often dug with the spade."

Again he observes, "The depth that the plough should go is a matter that ought to be attended to. The depth should be governed in some measure by the staple of the soil. Where the soil is deep,

deep ploughing is best. But where the soil is very thin, shoal ploughing is necessary, for if the plough turn up much of the under stratum, and mix it with the soil, it will be rather hurtful, at least for some years after."

The celebrated cultivator Earl Stimson, of Galway, N. Y. in a letter to Judge Buel, published in the current vol. of the N. E. Farmer, p. 317, states as follows:

"The land I now till, at first would not produce on an average more than fifteen or twenty bushels of corn, ten or fifteen bushels of wheat, barley or rye, and from half a ton to one ton of hay per acre. I commenced making, saving and applying my manure in the most economical way on the surface, and ploughing shallow; and in ten or twelve years, I found I had brought the land back to its original state of fertility," &c.

With regard to manuring corn in the hill, Dr. Deane's rule was as follows: "If twenty loads of good manure can be afforded for an acre, it should be spread on the land and ploughed in: If no more than half that quantity, it will be best to put it in holes. In the former case, the corn usually comes up better, suffers less by drought and worms; and the land is left in better order after the crop. In the latter case the plants are more assisted in their growth, in proportion to the quantity of manure. If the manure be new dung, burying it under the furrows is by far the better method. None but old dung should be put in the hills."

Such are the opinions of the celebrated agriculturists Dr. Deane and Mr. Stimson. But they are fullible, and we would be glad to publish such views of the subject either in corroboration or contradiction of those opinions as our correspondents may be so obliging as to furnish.

For the New England Farmer.

TRANSPLANTING WHITE PINES.

MR. FESSENDEN—In your last paper is an article from one of your correspondents requesting information as to the best method of transplanting the white pine. As I have suffered much inconvenience from erroneous advice upon this subject I am very happy that I have the opportunity of giving your correspondent the result of my experience, and enabling him, if he will follow my directions, to raise a grove of pines as easily as he can raise a grove of mulberries.

I have planted them in November, March, April and May; but I believe the last of March to be the proper time to remove them successfully. The ground is then moist and the trees may be taken out without breaking the roots or injuring the trunks by wrenching them. The bark of the pine is so tender that if the earth be not first cut round with a spade, the strength necessary to pull it out will slip the bark and so injure it as to prevent its growth, although there may be no external wound or injury.

Those which I have transplanted are from three to eight feet high, and when I have taken them out of the ground, I have taken the earth from the roots with my hands. The holes for receiving them are made large enough to admit all the roots extended in their natural position, it being injuri-

ous to bend or coil them up. When the holes are about half filled, water is poured in so as to make the earth like mortar, and this process effectually covers all the roots and fibres, and leaves no part of them naked. The holes are then filled up, covering the roots about three inches deep, and stones placed near the trunk to prevent the wind from moving the roots from their position in the earth. None of the branches should be cut off.

The trees should be planted so thick as to shade the roots of each other. Natural groves of pines grow most rapidly when they grow very thick, and are more regular in their forms. Where they stand singly or alone, they rarely have a handsome shape, nor do they attain to any considerable height. This may not always be the case, but it is believed to be generally so.

A friend of mine has succeeded very well in removing the earth with the tree. His method is, to cut round with the spade and retain the earth removed with the roots, and the only objection to this mode is, that the earth falls out in the removal, which leaves in setting it into the earth a hollow place directly under the trunk. In almost every instance when I have attempted his plan and the tree has not succeeded, in taking it up, I have found that the under side of the larger roots directly under the trunk had not touched the earth.

After planting the trees I have covered the ground with hay to the depth of four or five inches. Chips would answer the same purpose. This keeps the moisture in the ground, effecting an operation similar to that produced by the falling of the leaves of the pine.

White pines grow best in a good soil; like other forest trees they will grow any where, but they are most thrifty when the soil is rich. It is a remark often made by those engaged in the lumber trade that where land bearing pines is good, the timber will be good. It is believed the banks of the Connecticut, in New Hampshire and Vermont, were covered with a heavy growth of white pine when the settlements commenced in 1764. But if I am wrong in this, you can correct me.

The laurel, which bears one of the most beautiful flowers found in New England, may be planted among pines with great certainty of success. This like the pine, must be so planted as not to have its roots exposed to the sun. I have two large roots which are now covered with blossoms and look very finely. This is the second time they have blossomed since they were transplanted, and they appear as vigorous and thrifty as when in the woods.

Your correspondent asks what kind of forest trees may be planted with the view to the best advantage. This inquiry I cannot answer.

If the information I have given shall be of any service, I shall be very grateful to your correspondent if he will tell me how I can successfully transplant the walnut and white oak. I have made several attempts at transplanting them, and have failed totally. I thought I would take a more certain course, and so planted the nuts, thinking I could raise them from the seed, but the squirrels dig them up nearly as soon as they are put down, and now I am in despair.

Very respectfully, your humble servant,
GERVASE MARKHAM.
Worcester, June 21st, 1834.

The cost of transporting the obelisk of Thebes to Paris will not be far from two millions of francs.

From the Genesee Farmer.
ON THE MANAGEMENT OF NEWLY TRANSPLANTED TREES.

WE have observed in regard to transplanting fruit trees, that we have rarely lost one that stood in cultivated ground, where the hoe was introduced several times in the course of the summer; but on the contrary where the trees were set in grassy land, or where the cultivation was neglected, our losses have been considerable. We therefore advise in order to insure the safety of such as have been planted out, either in the last autumn or this spring, to have the ground well hoed round them as often as once a month; and if it be done every fortnight, it will be still better. The labor will not differ very materially from hoeing a hill of corn. It is worthy of notice however, that the oftener it is done, the easier it is to do—because the soil will be kept loose and mellow.

To water trees in that condition may sometimes be useful; but we are not free to recommend it very highly. A loamy soil that is much watered, soon becomes hard; the surface is glazed, rendered in a great measure impermeable to the air, and consequently is no longer capable of affording in dry weather the necessary nourishment to the plant. The sources of its fertility are obstructed. This may be better understood by some of our readers, when we state on the authority of Sir Humphrey Davy, that a soil in the greatest degree absorbent, exposed to the atmosphere till it becomes dry to the touch, still contains moisture equal to one eight part of its whole weight. This is discoverable by subjecting it to a heat indicated by 300 degrees of Fahrenheit's thermometer. Now all water not chemically combined, but only adhering to parts of the soil, is in constant use in vegetation: and the one-eight part referred to is of this kind. If we estimate common fertile soils however, as containing only one-twelfth part, then in 400 pounds of soil, even when it is dry to the touch, we shall have 33 pounds of water in store for the use of vegetation; and it is particularly worthy of notice that such soils, when deprived of a portion of this by plants, procure a fresh supply by constantly absorbing water from the atmosphere, where it exists in the state of vapor. In effect, a good soil is a perpetual fountain, even in dry weather.

From these statements it must be evident that unless the ground is frequently cultivated and kept mellow, so that between its particles the air can pass in, the latter cannot impart the moisture which it holds in solution; but when the soil is freshly broken, minutely divided, and prevented from conglomerating, these invisible springs are preserved in order, and plants that drink from them will long resist the drouth. Let the hoe then, be freely and frequently used.

FRUIT TREES.

HORES have been cherished this spring, that the canker worms which have made such desolation among our orchards, for some years past, were in some measure destroyed by the late frosts of the season, or by some other cause; but this we believe is not the case—the insects only being later in their operations.

We have heard of a very simple remedy for this case, accidentally discovered, and successfully practised by an individual of this town. It has proved entirely effective in his own garden. It is nothing more or less than taking the burrs, commonly called *cuckold-buttons*, produced by the bur-

dock, and forming two rings or bands round the trunk of the tree a few inches apart. This of course should be done in the fall; and it is easily accomplished, as the burrs readily and closely adhere to each other, and will remain for a year or more. The numerous sharp points or hooks will prevent the ascent of the worm or grub. The individual who has tested it says that he never knew the insects to be able to pass the second barrier. This is a *deposit* subject worthy of consideration, and the heretofore obnoxious burdock should be protected rather than destroyed.

ON THE CURING OF CLOVER.

The common method of curing clover is bad. The object to be attained is, to cure it in the *cheapest* and *best* manner. The common practice of spreading clover from the swath, causes the leaves and blossoms to dry and crumble, ere the haulm or stocks are sufficiently cured. Thus either the finer parts of the hay are lost, or the crop is housed with so much moisture, as to cause it to heat, and often to spoil. Clover should only be spread when it has become wet in the swath and should be gathered again before the leaves dry and crumble. Both these evils may be avoided, and labor saved withal, by curing the grass wholly in the swath and cock. After experiencing the serious disadvantages of the old method, I adopted the one I am about to recommend, and have pursued it satisfactorily ten or a dozen years. My practice has been to leave the clover to wilt in the swath, and when partially dried, either to turn the swaths, or to make grass cocks the same day, so as to secure the dried portions from the dew. That which is not put into cocks the first day, is thus secured the second day, or as soon as it becomes partially dried. These grass cocks are permitted to stand one, two, or three days, according as the weather is, and as the curing process has progressed, when they are opened at nine or ten o'clock on a fair day, the hay turned over between eleven and three, and soon after turning, gathered again for the cart. Thus cured, the hay is perfectly bright and sweet, and hardly a blossom or a leaf wasted. Some care is required in making the cocks. The grass is collected with forks and placed on dry ground, between the swaths, in as small a compass as convenient at the base, say two or three feet in diameter, and rising in a cone to the height of four or five feet.

The advantages of this mode of curing clover are:

1. The labor of spreading from the swath is saved.

2. The labor of the hand rake is abridged, or may be wholly dispensed with, if the horse rake is used to glean the field when the hay is taken off, the forks sufficing to collect it tolerably clean in the cocking process.

3. It prevents in a great measure, injury from dew and rain—for these cocks if rightly constructed, (not by rolling) will sustain a rain of some days—that is, they have done this with me—without heating, or becoming more than superficially wet.

4. Clover hay made in this way may almost invariably be housed in good condition; and if rain falls after the grass is mown, the quality of the hay is infinitely superior to what it would be under the old process of curing.

The rationale is this: The outside of the clover parts with much of its moisture while in the

swath, and what is called sweating in cock is merely the passage of moisture remaining in the succulent stocks, to their exterior, and to their leaves and blossoms—it is a diffusion—an equalization of the remaining moisture in the cock. When this has taken place, evaporation is greatly facilitated, and the whole mass acquires a uniform dryness on opening the cocks to the influence of the sun, and winds, if too long an exposure is guarded against. Evaporation progresses in the cocks, after the hay is gathered for the cart, and during the operation of loading and unloading.—*Cultivator.*

From Poulson's Advertiser.

MAMMOTH SYCAMORE TREE.

I HAVE just come from viewing this stupendous vegetable production. It is a *mastodon*, and is really well worth visiting.

This tree was reared on the banks of the Mohawk, in the town of Deerfield, within a mile of the city of Utica, (N. Y.) on land owned by the late venerable Mr. Thomas Sherman. Its dimensions are in its present state, 10 feet high from its base to the commencement of its branches; its circumference 32 feet, and its interior is capable of containing between 40 and 50 common sized persons.

The following is a copy of a letter received from an old and respectable inhabitant, residing in the vicinity of the place from whence the tree was taken to the proprietor.

Deerfield, (N. Y.) March 25th, 1834.

Mr. Stevenson—Dear Sir, It is with pleasure I learn that you are about making a tour of the principal cities of the United States for the purpose of exhibiting that surprising and wonderful phenomenon in nature, the Mammoth Sycamore tree, reared on the northern banks of the Mohawk, in this town, a memorial precious to its inhabitants from many sad and pleasing recollections. It may not be displeasing to you to hear from an old man, and one who was born and bred almost under the shadow of its branches, some incidents relative to its existence. Often in my boyhood have I climbed its topmost height in search of bird's nests, or sat at its base watching the placid stream of the Mohawk as it passed. But these pleasures are fled and seem only as a dream. I re-visit the scenes of my childhood and manhood, but something is wanting—the mighty Mohawk still pursues its devious course, but the companion and shelter of my youthful days has vanished, cut down by the ruthless hand of man. But why should we repine. The incidents, sad and solemn as they are which have taken place under its once benignant shade, has made it a nation's property, and those who could not have the pleasure of visiting it where it once stood in its pristine glory, will be gratified with having it brought to their own doors.

Under this tree have assembled hordes of sanguinary savages, celebrating their infernal orgies over the bodies of our peaceable and defenceless fellow countrymen, not even sparing our women and children. But what rendered it still more dear to us is the circumstance, that the first, the fast, and firm friend of our country, the young, the gallant Frenchman, the generous, the brave La Fayette, after a fatiguing, laborious, and dangerous march through the then wilderness, which has now become a garden of Eden, reposed under its branches, and partook of his homely fare.

It is said while resting here he shed tears of anguish at the heart rending details of his older companions in arms, who had been eye witnesses to the appalling sight of the effect of sword and bayonet of the hostile Briton, and the tomahawk and scalping knife of the still more merciless savage, which had crimsoned this lucid stream with the blood of his adopted countrymen.

And why should our tree of Columbian growth be less celebrated than that of Scotia?

A tree at Ellerslie, in Scotland, nothing in comparison to the size of this, gave shelter to the valorous but unfortunate Wallace, and has since been sought and almost worshipped by those of his countrymen who could reach it.

I am extremely sorry to hear that you intend leaving these shores and crossing the Atlantic with this precious relict of our nation's growth, and it is hoped that you will before your departure, give our citizens an opportunity to view the natural curiosity. Your friend and servant,

THOMAS SHERMAN.

GARLIC.

THE medical properties of garlic are various. In dropsical complaints, asthmas and agues, it is said to have been successfully used. Some instances have occurred, in deafness, of the beneficial effects of wrapping a clove of garlic in muslin and putting it into the ear. As a medicine internally taken, it is usually administered as a bolus, or made into pills. Its smell is considered an infallible remedy against vapors, and as useful in nearly all nervous disorders to which females are subject. An oil is sometimes prepared from garlic, which is so heavy as to sink in water; but the virtues of this pungent vegetable are more perfectly and more readily extracted by spirit of wine than in any other way. A syrup also is made from it.

The juice of garlic is said to be the best and strongest cement that can be adopted for broken glass and china, leaving little or no mark, if used with care. Snails, worms, and the grubs or larvae of insects, as well as moles and other vermin may be driven away by placing preparations of garlic in or near their haunts.—*Domestic Encyclopedia.*

Asparagus. Among the vegetables at a Horticultural Exhibition in England, were some heads of asparagus forced in four days by hot water.

MASS. HORTICULTURAL SOCIETY.

AN adjourned meeting of the Mass. Hort. Society was held at their room, on Saturday 28th June, the Vice President presiding—

Voted, That the committee appointed at a former meeting to take into consideration the expediency of an exhibition of Fruits and Flowers the ensuing autumn, be limited to the number of thirty.

The following members were then chosen to complete the committee—*Jacob Tidd, E. Putnam, J. Houghton, jr. E. M. Richards, E. Edwards, J. A. Kenrick, N. Davenport, James Vila, David Fossick, Thos. Brewer.*

Voted, That a sub-committee of five be appointed, to make proper arrangements, and attend to any business which may come before them—and

E. Vose, Jona. Winship, I. P. Davis, Dr. S. A. Shurtleff, G. W. Pratt—were appointed the committee.

Adjourned to Saturday, July 5th, at 11 o'clock.

CHAS. M. HOVEY, *Sec. pro tem.*

EXHIBITION OF FLOWERS.

Horticultural Hall, Saturday, June 28.

Mr. THO. MASON, Charlestown Vineyard—20 varieties Roses, double Carnations, double Ranunculus, Anemonies, with two bouquets of flowers making a variety.

Mr. S. WALKER, Roxbury—Pinks var. Bow's Claudius, Ford's seedling, Major Shaw, Roses var. seedling Roxbury Belle, and a variety of other flowers.

Messrs. HOVEY—Ranunculus, Globe Dahlia, Bouquet of flowers, Delphinium Roses, &c.

Mr. G. C. BARRETT, from Lancaster Garden, —*Campanula persica, folia, var. pleno, Campanula medium, var. alba, purpurea, Gladiolus communis, Corronilla varia, Penstemon lævigata, Lamium rugosum, Zeronthemum lucida, Digitalis alba and purpurea; Phlox carnea, sauveolens, and maculata; Anchusa paniculata, Delphinium sinensis, Clematis erecta, Gillea capitata, Centaurea equus of sorts, Pæony fragrans; Tradescantia red, white and blue; double Pinks, Spiria trifoliata Antirrhinums of sorts; Delphinium elatum, grandiflora; Clarkea pulchella, Coreopsis lanceolata.*

Mr. A. HOUGHTON, Lynn—variety of flowers.

Mr. SAMUEL POND, Cambridgeport—variety Roses, Pinks and other flowers.

Mr. J. A. KENRICK—variety of roses and other flowers.

Dr. SHURTLEFF, Moss Roses and other specimens.

Messrs. WINSHIPS—Improved seedling Roses, common kinds, and other flowers.

Many other gentlemen exhibited flowers, but as no names were attached the committee were unable to report on them. Those who may hereafter present flowers for exhibition at the Society's rooms, are requested to furnish lists, if they have a desire to have them reported, and the Committee would further respectfully remind the public that the exhibition of all productions for public inspection closes precisely at 12 o'clock, by a general regulation of the society.

By order of the Committee,

JONA. WINSHIP, *Chairman.*

We were much pleased with the appearance of Winship's Seedling roses. The petals were much more numerous and beautiful than in common roses; and afforded a striking comment on a text, from which we have often held forth, to wit: Vegetables as well as animals may be improved indefinitely by renewing from the seed, and propagating from the finest specimens of the best varieties.

—*Editor.*

FRUITS EXHIBITED.

Grapes. A basket containing 18 bunches of Muscadine and Sweetwater grapes, full grown and well filled, by Mr. JACOB TIDD of Roxbury.

Strawberries. 5 boxes Keen's Seedlings, 1 do. Mulberry, and a pot containing a plant of Keen's Seedling, with a profusion of fruits, by Mr. THOMAS HASTINGS, East Cambridge.

2 boxes of Royal Scarlet, by Mr. THOMAS MASON, Charlestown Vineyard.

1 box Blush Chili, by Mr. HAMILTON DAVIDSON, Charlestown.

4 boxes Methuen, 1 do. Conical Hautboy, 1 do. Southborough Seedlings, by Messrs. HOVEYS, Cambridgeport.

1 box Keen's Seedlings, and a large dish of fine Downton, by Mr. ELIJAH VOSE, Dorchester.

N. B. The specimens of Strawberries as noted above, were all excellent.

For the Committee, B. V. FRENCH.

From the Genesee Farmer.

HINTS ON PRUNING.

The principal objects of pruning, are to procure a good bole or trunk for timber; to form a head for the protection of fruit; and to subserve the purpose of ornament.

To effect these objects with the least trouble and greatest advantage, upon all non-resinous trees, the following rules are recommended:

1. Begin to prune the tree when it is young.
2. Cut close and smooth to the bole or limb.
3. Cut, when small, the branches which are likely to interfere, or become useless, and which if suffered to remain, will require to be removed at a more advanced period of growth.
4. Do not trim to excess. Let the branches occupy, at least a third of the entire height of a tree.
5. Do not prune when the tree bleeds. Where the preceding suggestions are observed, we may add—
6. Prune in the summer.

I proceed to offer my reasons for the rules here recommended, and

First, The food required to nourish the lateral useless branches, will go to increase the diameter and height of the plant, or swell the fruit, if these are judiciously removed. But a main consideration is, that the excision of small branches causes only small wounds, and small wounds speedily heal. The observation of this rule, therefore, facilitates growth, promotes health, and ultimately saves labor.

Secondly, This rule needs very little argument to enforce its propriety, as every observer must have frequently seen and lamented the ruinous effects of an opposite practice. The snags either send out useless spray; or, deprived of the feeble aid of these, they die and rot, and carry disease into the bole, and are thus often the cause of the premature loss of the tree. If cut close, the enlargement of the living wood soon covers the wound. In large branches where the saw must be used, the healing process is greatly facilitated, by pareing the cut, particularly the exterior edges, with the pruning knife; and it is a good precaution, before you use the saw, to notch under the intended cut, to prevent tearing the bark when the limb falls. In extirpating sprouts from the roots, and neither they nor those growing from the bole should be suffered long to remain, the like precaution of cutting close should be observed; for which purpose it is necessary first to remove the earth from about the collar, with the spade or other instrument.

Thirdly, The reasons for pruning a tree while young, apply here: It is easier to cut small than large limbs, and the wounds of the former soon heal. But the question presents, what limbs are to be cut? Generally all that are likely to cross each other, all feeble spray, the strongest on the bole, and the weakest in the top; for while the trees are in nursery, I think it serviceable to leave a few scattering laterals upon the bole, and it is beneficial, at all ages, to thin most kinds in the top. Yet the answer to the inquiry will depend principally upon the species of tree, and the design of the planter. If his object be timber, the leading shoot should be feathered up in a spiral form, and all other shoots likely to interfere with its growth be cut away. If the object be fruit, beauty and utility are to be consulted, and these are seldom incompatible in the eyes of a fruit grower, for with him productiveness constitutes

beauty. If ornament be the main consideration, no special directions can be given, as the species employed, the location, and the taste and fancy of the planter, will have a controlling influence. The rule for timber trees will not apply to either those destined for fruit or ornament.

In orchard and garden fruit, generally, the endeavor should be to obtain a low and spreading top. When a clean bole is obtained to a sufficient height, say, in the orchard, of seven or eight feet, and in the garden, according to fancy, the leading shoot should be cut in, and three or four more branches left to form the head; which, when the habit of the tree will permit it, should be pruned so as to give it a besom form, or that of a broom divested of its centre. Several advantages arise from this and a more extended form. It admits the air more freely, to mature the fruit and wood; it renders the trees less liable to be blown down; it facilitates the gathering of the fruit, and the pruning of the tree. But its principal advantage consists in its tendency to increase oviparous or fruit buds, and consequently to augment the fruit. A great growth of wood seems to be incompatible with a great crop of fruit, and vice versa. A cow that gives much milk seldom takes on much flesh during the milking season. If the secreted food is converted into milk and fruit, there can be but little reasonable hope of its adding to the flesh of the animal, or the wood of the vegetable. Erect branches produce most wood buds. Straight limbs produce less fruit than those that are curved or crooked. Whatever retards or diminishes the flow of elaborated sap, in a healthy tree, is favorable to the production of fruit. Hence wall trees, whose limbs are trained in the form of a fan, or in a horizontal direction, bear better fruit than those that grow upright as standards. Hence young trees are more apt to show blossoms the first and second year after transplanting, than in the two subsequent years. Pomologists have endeavored to render this law in vegetation subservient to their interests, by adopting artificial means for producing the production of fruit buds. These means consist in ring-barking, transplanting, cutting the roots, training, pruning, &c. The pears in the Caledonian horticultural garden are trained *en quenouille*, that is, the lateral branches are cut in to a short distance of the main stem, and kept so, and the fruit is produced on the spurs growing from these short branches. In the horticultural garden of London, the limbs of the pear are tied down in a drooping position, resembling somewhat in appearance the weeping willow. The vines cultivated at Thomery, celebrated for their superior fruit, are planted 18 inches apart, trained in the form of a T, the top horizontally, and restricted in their growth to four feet from the main stem. In this way a trellance of eight feet long, and eight feet high, is sufficient for five vines, which produce upon an average 320 bunches of fruit. These modes of training have a common object, that of restricting the growth of wood, and producing an increase of fruit. Those who wish to examine the modes of training here spoken of, in detail, are referred to Loudon's Gardener's Magazine.

Fourthly, Leaves are as necessary in the economy of vegetation as roots. The sap must be elaborated in these before it can be transmuted into wood, bark or fruit. A tree cannot thrive therefore, when these organs are deficient or diseased. If sufficient leaves or branches to produce

them, are not left to concoct or digest the sap which is propelled from the roots, the tree, to use a modern term, but a just comparison, becomes *dyspeptic*; the vegetable blood is vitiated, the wood loses its texture, and a stunted growth or premature death generally ensues. Hence great precautions should be used against excessive pruning.

Fifthly, To prune when the tree bleeds tends to debilitate, by wasting what is designed as food for the tree. I have known it fatal to the vine. What is called bleeding is the flowing of the sap from wounds, before it has been converted into aliment. This sap flows most freely while the buds are swelling, and until the leaves are fully capable of discharging their office, as is strongly instanced in the maple, birch, &c. Our orchards are generally pruned in March, which is probably the most unfavorable month in the year for this operation.

Sixthly, The advantages of summer pruning are that the tree being then in vigorous growth, the wounds heal speedily; and the sap being concocted and thick, does not flow from the wounds, and thereby impair the health of the plant. Summer pruning should not be performed, however, before July, when the new growth has considerably advanced. It may be well to add, as this suggestion may seem unsound, that summer pruning is recommended by the best authorities. "As a general rule" says Pontney "summer is preferable to winter pruning;" and Sang suspends pruning, "from the beginning of February, to the middle of July, but carries it on during every other month of the year."

In regard to evergreens, which with us are confined principally to resinous trees, it is the general practice of nurserymen, and I think it a judicious one, not to prune them until they have acquired some years growth, and then but sparingly and at long intervals, displacing two or three tiers of the lower branches, every two or three years. Monteith says, "never cut off a branch until it has begun to rot, as the bleeding of a live branch will go far to kill the tree."

The implements employed in pruning, and the manner of using them, are matters of moment. If the operation is commenced when the tree is young, and judiciously followed up, a good knife, a small saw, and a chisel fixed on a six foot handle, to trim the tops and extremities of the branches, are all the tools that are required. A large saw will be occasionally wanted; but an axe or hatchet should never be employed, as they fracture the wood, bruise and tear the bark, and disfigure the tree.

Albany, December, 1830.

From the Genesee Farmer.

DIFFERENT BREEDS OF SWINE.

UNTIL lately I had little idea that so great a difference existed in the breed of swine. Last fall when in Albany, I bought of Mr. Bement two beautiful China spotted hogs. The female was in pig to a fine white English boar, sent to Mr. B. by Doctor Hosack; and although young, she produced a fine litter of eight pigs, the finest in shape and proportion that I ever saw. The male pigs I gave away to my agricultural friends in different parts of the country, and the females with their mother, and the China boar I sent this spring to my farm on Grand Island. They have eaten there scarcely anything but grass, and yet all keep too fat for

good breeders, so my farmer says, and lie down nearly all the time, never attempting to get into mischief or causing trouble. When we took possession of the farm, I bought ten "wood hogs," of the man who had occupied the place previously. To be sure they looked scurvy and mean, with long snouts, high thin backs, light quarters and long tails; yet I thought something could be made of them. So at it we went. I ordered the hogs to have all the slops and wash of the family, not a small one, with the skim-milk of several cows; and even my beautiful plump Chinas were turned off to pick their own way for the benefit of these graceless rooters of the woods. Well, we kept the rascals about six weeks, and fed them well, and actually, the more we fed them, the worse they looked; and finally to get rid of the nuisance which their sight occasioned me whenever I visited the farm, and to be free from their mischief, for the Vandals were continually prying about to see what harm they could do when not eating, I agreed with one of my men to put the hogs into a boat and rid the island of them at once, sell them for the most he could get, and give me half the amount. He thought *selling hogs to the haves* a good business, and forthwith despatched them to a neighboring still-yard, a worthy receptacle for such a concern.

I actually believe, that with what those ravenous beasts consumed, we can keep thirty of the China breed, well growing, fat, and quiet. They are of good size, will fat to full 400 pounds, and their pork is of most superior quality. I believe them every way superior to the Byfield or Grass breed, being longer bodied and very broad. I intend increasing the breed as rapidly as possible from my own stock, and keeping no other, unless to improve by an occasional cross from abroad, to keep up good blood and constitution. Yet strange to say, although my China boar is pronounced by excellent judges the most perfect animal of the kind they ever saw, he was kept through the last fall and winter in town by a neighbor of mine, and did not earn his keeping. So much encouragement for procuring fine animals to improve the stock of the country. I however obtained the animals for my own use, and their superior quality abundantly pays for their extra expense in purchase.

Neat Stock. We found on Grand Island among the settlers, a little breed of cattle, very hardy and active, that were accustomed to full feeding in the summers on the abundant grass and herbage of the island, and during winter starved off their flesh to pretty sorry dimensions by the return of spring. I have bought a number of these little cows, say fifteen or twenty. They are mostly excellent milkers, tolerably shaped, and may be much improved by crosses of the finer breeds. I have also purchased several of the best cows to be found in the neighboring country, and intend making a thorough trial in breeding. My improved Short Horn bull is at one farm, and the Devon at another, and we have about thirty cows in calf to the first, and twenty to the latter. I have also three Devon cows of the best blood to be found, and intend if time and opportunity offers, to make some regular comparisons of the expense of keeping, quantity of provisions consumed, and the relative profits for dairy and beef of the two breeds and their crosses. Both appear well. But to my eye the improved Short Horn bears the palm. His splendid stately figure, noble carriage, great size and fine beautiful limbs, show much in his favor;

while the compact roundness and solidity, deep mahogany color, and beautiful form of the little Devons, have much to commend them also. In fact, both breeds are good for different purposes, and cannot be too highly esteemed; yet I am free to say that further observation inclines me to prefer the improved Short Horns for a general stock.

Cattle in our neighborhood have sometimes died of the bloody murrain, supposed to be caused by sucking in leeches when drinking. We have as yet lost none. I have had constructed some heavy plank troughs, 12 or 15 feet long, and fastened on to heavy wooden blocks, to prevent being upset, for the use of the cattle. In these a coating of tar has been poured over the bottom, and sulphur and alum sprinkled on; then a considerable quantity of salt, so that the cattle can lick it up at their pleasure. Cattle will never eat more salt than they want, and the other articles serve as preventives to disease. Many people only salt their cattle occasionally. But this is apt to be neglected, and cattle get altogether too little, and cannot be kept perfectly healthy without *enough* of it. It also seems to keep them about home, and attaches them to the yard, and makes them docile, affectionate, and easy to manage. All domestic animals have good feelings and dispositions if kindly treated, and much of the sullenness and vice in which they sometimes indulge, arises from bad treatment in the first instance by their keepers. These matters should be well taken into account by every farmer and breeder of stock. Not only humanity, but economy and good thrift requires it.

ULMUS.

IMPROVED SYSTEM OF BEE MANAGEMENT.

THERE is no branch of rural economy connected with more agreeable associations than that of bee management. The proverbially industrious habits of the insect, and its extreme ingenuity in the construction of its domicile, and the disposition of its treasures, are such as to excite the admiration of the most unobservant. The common necessity of destroying the stock in order to obtain the produce of their labors, has been always matter of regret. Many plans have been hitherto devised for the purpose of obtaining the honey without the destruction of the bees. But they have only been attended with partial success. The object has, however, been latterly and more perfectly attained by Mr. Nutt, a practical apiarian of Lincolnshire whose system of management has given this branch of rural economy an importance and value of which it was not before considered susceptible, both in the greater productiveness of the bees, and the much superior quality of the honey.

The first part of Mr. Nutt's plan of operation is to have the hive, into which the stock is introduced, untouched. When it is filled with honey, (the contents of which are to be reserved for the use of the bees,) the capacity of the hive is increased by the addition of another box to the side communicating with the hive by apertures, which give free admission to the bees in all parts of the box.

The next important object in Mr. Nutt's system is to ensure a regular and uniform temperature in this portion of the hive, without diminishing the temperature of that which contains the stock. The ventilation necessary for this purpose is effected by the means of a perforated tin tube, extending down to a considerable distance from the top into the hive, and connected with an aperture at the bot-

tom, which may be partly or wholly closed by a tin slide, thus modifying the circulation of the air and consequent degree of temperature. The temperature of this side box, which is indicated by a thermometer introduced into the tube, ought to be 70 deg. which is the natural temperature of the working hive; but in that which contains the stock, a temperature of 90 deg. is necessary, as well for the incubation of the queen bee, as the maturity of the young. The parent hive is, then, as well the residence of the queen bee as the nursery of the young, whilst the side boxes are but additional storehouses for the reception of the superfluous honey, which may be taken away without impoverishing the stock, or robbing them of their winter sustenance.

When the thermometer placed on the side box rapidly rises to 90 or 100 deg. the necessity of again providing the bees with fresh room is indicated; and this is effected by establishing another box on the opposite side of the hive. The bees, finding an increase of room, will readily recommence their labors in this new apartment.

Then follows, in Mr. Nutt's system, the operation of separating the bees from this second hive. This is effected by the ventilator, by which the internal temperature of the hive may be reduced to that of the external atmosphere; and when on the approach of night, the bees, recoiling from the cool air, go back into the middle box, the connexion between the two may be closed, and the full hive withdrawn, without the imprisonment or destruction of a single laborer. The same arrangements are again renewed, as the bees continue their successful labors. In this system, no provision is made for swarming, which cannot occur under this arrangement, the emigration of a part of the stock being only occasioned by a want of room in which the bees may pursue their labors.

The honey furnished under this system of management is found to be far superior both in quality and quantity to that obtained under any other arrangements. The honey and wax are as white as refined sugar. This superiority in quality it owes as well to the modified temperature at which the bees secrete their products, as to its total exemption from all extraneous animal and vegetable matters, and in particular from the pollen or bee-bread, which is taken in considerable quantities into the stock-hive for the support of the young. This superiority of the honey is only equalled by the quantity of the supply; the usual annual supply from one stock is about one hundred weight of honey; whilst, in the course of one season, Mr. Nutt has procured the large quantity of 296 lbs. This increase in quantity is owing to the excellent disposition of the arrangements, by which the industrious efforts of the bees are never retarded, nor their strength weakened at the time when the fruits and flowers abound from which their treasures are obtained.—*New Bedford Courier.*

MARLE

—Is usually found at a depth of from one to three feet, and may be known by the effervescence it occasions when dropped in vinegar or other strong acid—a load of even the weakest kind well mixed with the black bog dirt found above it, is more efficacious manure than two loads of common barn-dung. Having little or no effect when first applied to wheat and rye, by afterwards covering the ground with a thick growth of white clover, it is rendered fit for producing largely of those crops.

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JULY 2, 1834.

FARMER'S WORK.

Preservation of new made Hay. It has been recommended by some agriculturists, in housing new made clover hay, especially if it happen not to be thoroughly dry, to mix layers of the hay, while depositing it in the mow, with layers of straw reserved for that purpose. In this way the strength of the clover is absorbed by the straw, which cattle will eat greedily, when thus managed. Another way to preserve clover, or indeed any other kind of grass is to salt it, when stowed away in the mow. From 4 to 8 quarts to the ton is recommended, to be scattered, layer after layer as evenly as possible, so as to impregnate the whole mass.

Saving Seeds. Gather seeds of all the sorts, which you intend to sell or to sow from the finest, fairest and most fruitful specimens of the plants on which the seeds grew. It is a fact of much importance to be known and practised on by every cultivator, that vegetables as well as animals may be improved by propagating from the best individuals. Some have found their account in culling their seed wheat from fine plants before harvesting the general crop.

Manure from Swine. It is a good plan to keep even your hogs at work lazy as they are, they will establish a manure manufactory, if you will furnish the stock and fixtures, and charge nothing for their labor or time. The raw material may consist of brakes from swamps, weeds from fields and gardens, turf, scrapings of ditches and other refuse matter, which you had better make over to your swine, and cart to their pens, than keep on hand.

Fallen Fruit. It will be consonant with the best rules of rural economy for every farmer, gardener and orchardist to gather all his fallen and decaying fruit, as well as such as being set too thick should be picked in part, in order to make room for the remainder. These you will boil with a little Indian meal, oats, refuse rice, or other farinaceous substance. The fruit will be the more valuable as diet for hogs for having been boiled, and the worms [curculiones] which it generally contains when fallen or decayed are thus sure to be destroyed.

Pastures and Cattle. Plaster or live ashes, sown upon pasture grounds will not only repay a handsome profit by increasing the value of feed by bringing in the finer grasses, such as white clover, &c. but will greatly improve the soil for any succeeding crop. It will not be correct husbandry, when you have turned your cattle to grass to overlook or neglect them. It will be well to see every animal every day; and take care to keep salt always within their reach. We apprehend that farmers often suffer by their negligence in this particular. Good water is likewise a great accommodation in pastures. "Water," says a writer for the American Farmer, "must always be within the reach of all animals at all times, and that of the purest quality. Some farmers, having no running water in their pastures, give their cattle water twice or thrice a day by driving them to a spring or pump, or stream. They may want water at these times, and may not, just as it happens; but they certainly do not get it at all times when they do want it. Of this we can judge by ourselves. Who could possibly do with water only at certain times, and these times always the same?"

With the human species this would be insupportable. It is the same with all animals, and the whole benefit of water depends upon its being taken when the stomach calls for it. Water, of all substances that contribute to the support and nurture of animal life and health, is least capable of being regulated in its administration by times and seasons. Animals that have free access to salt require water oftener than those which have no salt; but those that are salted irregularly require constant access to water more than any others, as their thirst is fitful in proportion to the irregularity of their salting.

"Let those who have been careless in this matter try the experiment of giving salt, regularly and plentifully every other day, with constant access to pure water, and the improved condition of their stock in one month, will induce them to continue the practice hereafter. They will never again, see their cattle licking one another, and filling their stomachs with 'witch balls.'"

Some writers, however, deny the necessity of water in pastures for some sorts of stock. Dr. Deane observed that "sheep, calves and horses, unless they are worked, it is said require no water in their pastures. The want of water induces them to feed in the night, when the dew is on, and the grass the more nutritious. Cows, however, want pure water." This want of coincidence in opinion among the sages of agriculture deserves consideration, and it were well if the matter were decided by the test of experiment.

We have before stated, page 382, that a mixture of salt with unleached ashes, in the proportion of one quart of fine salt to one-half bushel of ashes, and placed where cattle and sheep can have access to it, was recommended by a practical farmer; but it is sometimes useful to give line upon line.

Hay-making. Make as much of your hay as is practicable in the early part of the season, as there is at that time a greater probability of your being favored with fair weather. The *Farmer's Guide* asserts that "it has been found by actual observation, for a number of years, that on an average more rain falls in summer after the 15th or 20th of July than before." "Grass" says Mr. Goodsell in his *Farmer* "after it is mown in wet weather is not materially injured, although it does not dry for some days, provided it is often turned over to prevent its turning white. The loss of nutritive matter does not correspond to its change of color. Timothy (herds grass) cut late, or after the seed has come to its full size, does not look as green as when cut in flower, and yet contains more nutritive matter, and is preferred by most kinds of stock."

How to preserve Peas against drought. In an article written by the conductor of Loudon's Magazine, entitled *Notes on Gardens*, &c. we find the following passage. "We were struck with the great breadth devoted to late peas, which looked so remarkably well that, considering the extraordinary dryness of the season, we could not help asking Mr. Oldacre (the gardener) if he had any particular method of watering them? His answer was, that he never watered them at all after they were above ground. He sowed them in the bottom of drills 6 inches deep, filled the drill half full of soil, and then gave them such a thorough soaking of water as to saturate all the soil under and about the seed. After this he fills in the remainder of the earth; and the whole compartments being now dry in

appearance, he rolls it quite smooth with a heavy roller, and gives no other culture of any kind till the peas are fit to stick.

ITEMS OF INTELLIGENCE.

The Crops. Owing to the May rains the wheat fields present a more luxuriant appearance than at this period in any of the last eight years, and having thoroughly covered the ground, will prevent the rays of the sun from extracting the moisture from the root. Unless injured by mildew or some other accidental cause, wheat promises to be unusually abundant; but other crops are all in too backward a state to form an opinion of them, except pasture and meadow, which give promise of abundance, and will be excellent unless parched by hot and dry weather. If the farmers would manure their meadow lands slightly—plough the ground intended for spring crops in the fall, and plant earlier, they would run much less risk from dry summers and early frosts than they do according to their present system; they would also have weightier crops and of a better quality. Fall ploughing is quite as necessary to spring crops as summer fallowing is to fall wheat.—*Hamilton Mercury*.

Shocking Occurrence. The Norristown Herald states, that on Friday last, a daughter of Mr. B. Hoffman, near the Broad Axe tavern, of Montgomery county, who was subject to spasmodic attacks, unfortunately while engaged in feeding some hogs, fell into the pen and was partly devoured by the ravenous beasts. When found life was extinct.

Longevity. A few days since, says the Gloucester Telegraph, some gentlemen called to see Mr. Pew, of this town, who will be one hundred and two years old the third of August next, but were not successful as he was engaged in hoeing, some distance from home.

Muzzling Dogs. The Select and Common Councils of Philadelphia, after due deliberation, have passed a new ordinance for the more secure fastening of dogs' mouths. It provides that after the first of July next, instead of the leather strap, now used, all dogs shall be muzzled with a substantial wire basket, placed so as effectually to enclose the mouth, and prevent snapping and biting.

A beautiful specimen of fine cloth, made from the fibres of the leaves of the pine apple, from Manilla, resembling the finest linen cambric, was presented by Miss Eliza Schreoder, at the late Horticultural Exhibition in Baltimore.

Recruiting Grass Land. We copy from the New England Farmer a communication from Mr. William Clark, jr. of this town, detailing his method of laying down land to grass. We have recently examined two pieces of grass, sown by him the last season among corn and not noticed in his communication. Both will yield good crops, but the grass on the upland piece is superior to that in the meadow. The upland, an old, worn-out sandy field, has on it one of the most luxuriant crops of clover and herdsgrass that we have seen this season. Whatever others may think of Mr. Clark's experiments, it is certain that they have been profitable to him.—*Hampshire Gazette*.

Clover Seed in Oak Casks. In this country we believe most of the clover seed sent to market is in casks made of oak. This wood injures the color of the seed, giving it a dull brown appearance, resembling old English seed. In England all kinds of clovers are kept in sacks made of hemp. Farmers would, therefore, do well to send their clovers in bags.—*N. Y. Farmer*.

A woman was frozen to death in Schoharie co. N. Y. on Thursday, 15th of May. She was going from one dwelling to another, during the snow storm, became chilled, stopped on the road, and perished.

See to your Wells. Parents, if you wish to preserve the health of your families, immediately appoint a day for the purpose of thoroughly cleansing your wells, as you will not only add to the flavor of the water, but prevent many of those contagious disorders that rage at the coming season of the year. I have recently consulted an experienced and candid Physician, who gave it as his opinion, that a strict attention to the cleansing of wells would serve as a preventive to a large proportion of the disorders which are common to the autumnal months. He gave me an example of the inattention of people to this important subject. He said, being called to examine a patient in a family of high respectability, he was persuaded that the complaint originated from using stagnant water. By his request, the well was cleaned out, when behold the skeletons of one cat and five toads were among the filth that was taken out of the well. He gave me other satisfactory evidence of the correctness of his opinion. I advise all who have not already done it, to cleanse their wells.—*Worcester Spy.*

Some ladies in Illinois have formed a butter society, for the purpose of encouraging the manufacture of good butter.

A Mammoth Trout.—Gen. Cadwallader and lady of Philadelphia, being on a visit to Bethlehem, Pa. Mr. G. H. Goudie presented to Mr. Ziegler, of the Eagle Hotel, one of the largest brook trout perhaps ever known in this county, which was served up in his best style, at a dinner last Monday to the General and lady, and a party of ladies and gentlemen of Bethlehem, Pa. The trout measured 22 inches in length, 19 inches in circumference, and weighed 7 1-8 lbs. It was raised by Mr. Jacob Schneider of the Lehigh Water Gap, who had kept it for the last six years in a trough in the second story of his house. We understand Mr. C. of Bethlehem has about 400 fine trout yet in his front house, measuring from 10 to 17 inches in length.—*Easton Sentinel.*

ISLAND IN THE WINNEPESOGEE LAKE FOR SALE.

Will be sold at public auction, on the premises, on THURSDAY, the seventeenth day of July (unless previously disposed of at private sale,) the Island in Winnepesogee Lake known as MERINO ISLAND.

This island is situated within the limits of Tufstonborough, N. H. about 35 miles from Concord, and one quarter of a mile from the mainland. It contains between five and six hundred acres, and is admirably calculated for a sheep and dairy farm, for which it has for several years past been very successfully cultivated. It is in two parts, connected by a neck two rods wide. One part (of which about one half is cleared, and the other in forest) contains the pasture, nearly 300 acres in extent, of very high and sweet feed—the other part, about 200 acres, (of which two thirds are cleared,) contains all the buildings, which are extensive and very convenient, having all been erected by the present proprietor within ten years. There is a comfortable farm house, of 43 by 24 feet; a barn 80 by 40, with a shed up to the eaves on three sides, of 15 feet wide for sheep; another barn of 50 by 30 feet for cattle and horses; a dairy and cheese house, with ice house connected; corn-barn, and wind-mill, nearly new.

At the same time and place, will be sold the STOCK now upon the island, consisting of about 500 Sheep and Lambs, of the best merino and Saxony blood; an imported Bull (full blood North Devon); about 30 Cows and Heifers, chiefly of the Alderney and Durham breeds; a yoke of Oxen, and two yoke of Steers. The horned stock are all very superior animals, and the butter and cheese from this dairy has commanded the highest prices in Boston for the last three years.

Also, two MARES, four and five years old, sired by Barefoot, of much promise; one other Mare—also the Swine—and all the Farming Tools.

The Steamboat leaves Alton on Tuesdays, Thursdays and Saturdays, and Centre Harbor on Mondays, Wednesdays and Fridays, and will land passengers on the island.

For terms and conditions of sale, apply to PRESCOTT & DERBY, No. 16 Court st. Boston, and for view of the premises to Capt. PILSBURY, on the island. jy 2

TURNIP SEED.

For Sale at the N. E. Seed Store, 51 and 52 North Market street, Early Dutch Turnip, Early Garden Stone ditto, Yellow Stone do.; White Flat Winter do.; Long Yellow French do.; Yellow Aberdeen do.; Ruta Baga do.

The two last are excellent kinds for Cattle. je 18

Ruta Baga.

FRUIT TREES.
ORNAMENTAL TREES, ROSES, FLOWERING PLANTS, &c. NURSERY of WILLIAM KENRICK in NEWTON, $\frac{5}{8}$ miles from Boston by the City Mills, and $\frac{1}{2}$ a mile from the Worcester

A rare collection of Fruit trees, Trees and shrubs of ornament, Roses, Dahlias, &c. This Nursery now covers compactly, the most part of 18 acres; and includes of Trees and plants in different stages of growth, from two to three hundred thousand. Of new celebrated Pears alone, 150 kinds, a part of which having been already proved in our climate, are especially recommended. Of Peaches, a Capital Collection, for extensive numbers and fine kinds—Apples—Cherries—Plums—Nectarines—Apricots—Almonds—Quinces—Grape Vines—Currants—Raspberries—Gooseberries—Strawberries—Figs, &c.—Selections from the best varieties known.

MORUS MULTICAULIS, or NEW CHINESE MULBERRY, so celebrated for the food of silkworms.

Of ROSES. A superb collection of from 300 to 400 hardy and China varieties; from numerous importations, and first rate sources. White Flowering Horse Chestnuts, Weeping Willows, Catalpas, Mountain Ash, Silver Firs, Venetian Sumach, Altheas, Honeysuckles, Azaleas, &c. &c.—in all, of Ornamental trees, and shrubs, 650 varieties. Of Herbaceous flowering Plants, 300 choice varieties, including the finest kinds of Peonies, and 100 splendid varieties of Double Dahlias.

Gentlemen are invited to forward their orders early in Autumn, being an excellent season for transplanting. Address to WILLIAM KENRICK, NEWTON. Trees, &c. delivered in Boston free of charge for transportation, and suitably packed. Or orders will receive the same attention if left with GEO. C. BARRETT, who is agent, at his seed store and New England Farmer Office, Nos. 51 & 52, North Market Street, Boston. Catalogues gratis on application. Je 25

DISHLEY, OR NEW LEICESTER SHEEP.

Two Rams and one Ewe, with her Ewe Lamb of four months old, of the pure breed as above—were imported from England last year from one of the most celebrated flocks, superior as a large mutton breed, and also very heavy fleeces of long combing or worsted wool.

Also, a very fine, 3 year old Bull, 3-4 blood Durham Short Horn.

Apply to JOHN PRINCE.

Jamaica Plains, June 25th, 1834.

GRINDSTONES ON FRICTION ROLLERS.

Grindstones of different sizes hung on Friction Rollers and moved with a treader, is found to be a great improvement on the mode of hanging grindstones, the ease with which they move upon the rollers renders them very easy to turn with the foot, by which the labor of one man is saved and the person in the act of grinding can govern the stone more to his mind by having the complete control of his work.

The above Stones may be found of a very superior kind, and hung completely as above described at the Agricultural Warehouse, 51 & 52 North Market street. jc 18

BRASS SYRINGES.

Just received at the Agricultural Warehouse, a good assortment of Willis's improved Brass SYRINGES for Green Houses, Grape Vines, &c. &c.—see Complete Farmer, page 315. jc 4 J. R. NEWELL.

ZINC WARE.

Just received, a further supply of Zinc Milk Pans, Kettles and deep Bake Pans, and for sale at the Agricultural Warehouse, No. 51 and 52 North Market Street.

The manufacturers of this article having closed their works, no more of them can be procured at present,—and as the season is at hand when these are most wanted, and as they are found on trial to produce a great increase of Milk, they are highly recommended to the public as one of the improvements of the day. my 14

BOX PLANTS.

From Seven Hundred to One Thousand Yards of Prime BOX in good order for Planting. To be taken up at any time when ordered. Orders may be left with GEO. C. BARRETT, New England Farmer Office, or apply to THOMAS MASON, Charlestown Vineyard. It may be had on fair terms by the Yard or Hundred. m 7

WHITE DUTCH CLOVER.

RECEIVED this week direct from Holland 1000 lbs. superior White CLOVER, warranted free from any kind of foul seed and at least worth one third more than American. This will be found an excellent Grass for Pasture land, &c. a16 GEO. C. BARRETT, New England Seed Store.

SEEDS.

Just received direct from Holland, a large assortment of CABBAGE SEEDS, in small and large quantities. These are from a House upon which the utmost reliance can be placed, and the quality of Dutch Seed is found superior. a 30

BRIGHTON MARKET.—MONDAY, June 30, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 242 Beef Cattle, 20 cows and calves, and 2040 sheep;

PRICES. Beef Cattle—Last week's prices were fully supported, about 70 Beef Cattle were from the neighborhood of Buffalo, N. Y. We quote prime at 6; good at 5 25 a 5 75; thin at 4 50 a 5.

Cows and Calves—Sales were effected at 19, 20, 23, 25, 28, 28 1/2, 30, and \$36.

Sheep—Dull. We noticed lots (most of which were Lambs) taken at 1 42, 1 50, 1 71, 1 88 and \$2; also lots with a larger proportion of old Sheep, taken at 2 25, 2 33 and \$2 50.

Swine—None at Market.

MISCELLANY.

From the Portsmouth Journal.

TO AN EARLY ROSE.

SAY—beautiful mingling of water, and dust,
 How?—where was thy fair form hid?
 When the branch that now bears thee, in fondness up,
 By the wintry blast was laid.
 Wert thou there, in the bark of that wither'd thing?
 Or down in the frozen earth?
 Or did part of thee lay in a wreath of snow,
 Which could boast of a cloudlet's birth?
 Wherever—sweet child of the elements,
 A lesson of truth thou dost bring;
 For much that seems dress to the human eye,
 May up into glory spring.
 But thou hast been nought save a simple bud,
 Through stormy, and sunny days—
 Now, thy tunic of green on thy stem is cast,
 And thou art all fragrance, and grace.
 So I—if unsear'd by the world's bright sun,
 And firm by its tempests driven;
 Shall throw off my vestment of changing dust,
 And bloom like thee, Rose, in Heaven.

S.

REMARK OF SIR HUMPHREY DAVY.

THERE appears nothing more accidental than the sex of an infant, yet take any great city or any great province, and you will find that the relation of males and females is unalterable. Again, a part of the pure air of the atmosphere is continually consumed in combustion and respiration; living vegetables emit this principle during their growth; nothing appears more accidental than the proportion of vegetable to animal life on the surface of the earth, yet they are perfectly equivalent; and the sexes, like the constitution of the atmosphere, depends upon the same unerring intelligence.

BURYING ALIVE.

WE have been furnished by a French gentleman, with whom we happened to converse a few days ago, on the subject to which it refers, with the following facts collected from medical history. They are painfully interesting, yet proper to be known, in order to prevent if possible their recurrence. Premature interments may take place in this country as probably as elsewhere. Physical organization is nearly the same throughout the whole of the human family; and we can conceive of no self upbraiding more deep or bitter than that which must be felt from the consciousness that a dear departed one had terminated life—not by the ordinary course of mortality, but by an unnecessary, premature consignment to the grave.—*N. Y. Com. Advertiser.*

"The diseases in which a partial and momentary suspension of life most often manifests itself, are asphyxia, hysterics, lethargy, hypochondria, convulsions, syncope, catalepsy, excessive loss of blood, tetanus, apoplexy, epilepsy, and ecstasy.

Among many cases which have been recorded the following are particularly striking:

Chancellor Bacon relates that Dr. Scott, nicknamed the 'subtle,' was buried alive at Cologne, and that recovering from his apparent death, he gnawed his hands, and broke his head in his tomb.

At Toulouse a lady having been buried in the church of the Capuchin friars with a diamond ring on her finger, a servant entered the vault to steal the ring; and as the finger was swelled and the ring could not come off, he began cutting the finger; but on hearing a loud shriek from the deceased the thief fell senseless. At the time of the

morning prayers, the monks having heard some groans, found the lady alive and the servant dead. Thus death had his prey—there was but a change of victims.

A street porter in Paris having died at the Hotel Dieu, was carried with the other dead into the same grave. Recovering his senses towards 11 at night, he tore open his winding sheet, made his way to his house, knocked at the door, which was not opened to him without some difficulty, and took possession of his lodgings.

In 1756, a woman in Paris was thought to be dead, and the body put on some straw with a taper at the feet. Some young men who sat up round the corpse, in a frolic overturned the taper which set the straw on fire. The deceased whose body the flames now reached, uttered a piercing shriek. Timely assistance was rendered, and she was so well recovered that after her resurrection she became the mother of several children.

On the 21st of November, 1763, the Abbe Prevot, well known for his literary productions, was taken with an apoplectic fit as he was travelling through the forest of Chantilly. Being supposed dead, he was carried to the house of the Mayor of the village, and the magistrate directed a post-mortem examination to be commenced. A piercing shriek uttered by the unfortunate man, proved that he was alive. He however, soon expired under the scalpel.

Dr. Devaux, a surgeon of St. Come hospital in Paris, had a maid servant, who had three times been carried to burial. She did not recover her senses the last time until they were lowering the coffin into the grave. That woman having died anew, she was kept six days, lest they should have to bring her back a fourth time.

A Mr. Rousseau of Rouen, had married a young lady of fourteen, whom he left in perfect health at his starting on a short journey. After a few days he heard that unless he returned immediately he would find his wife buried. On reaching home he found the funeral ready. In an agony of grief he had the coffin removed to his room and unscrewed. He placed the body upon the bed, and ordered twenty-five incisions to be made on it. At the twenty-sixth, probably deeper than the others, the deceased exclaimed, "how severely you hurt me!" Medical assistance was immediately given. The lady had afterwards twenty-six children.

The wife of Mr. Duhamel, a celebrated lawyer, having been supposed dead for twenty-four hours, the body was placed on a table for the purpose of preparing it for burial. Her husband strongly opposed it, not believing her dead. To ascertain it, and knowing she was very fond of the cymbal, and the tunes which cymbal players sing, he had one called. Upon hearing the instrument and the voice, the deceased recovered motion and speech. She survived her apparent death forty years.

Andre Vesale, first physician to Charles V. and Philip II. after attending a Spanish grandee thought him dead; and having obtained leave to examine the body, he had scarcely thrust the bistoury into it and opened the chest, when he perceived that the heart palpitated. The relatives of the deceased prosecuted him as guilty of murder, and the inquisitor as guilty of profaneness. Through the intercession of the king he obtained to be merely condemned to a pilgrimage to the Holy Land.

In the sitting, of the Royal Academy of Medi-

cine in 1827, M. Chantournelle read a paper on the danger of hasty inhumations. This led to a discussion in which M. Desgenettes stated that he had heard from M. Thouret, who had superintended the removal of the human remains of the cemetery and the charnel house Des Innocens, that many skeletons had been found in positions showing that the individuals had moved after their inhumation. M. Thouret had been so much struck with this, that he had inserted in his will an article relating to his own interment.

HOUSE FOUND IN A BOG.

At a recent meeting of the Society of Antiquarians, Mr. Mudge commented a description of an ancient house, discovered in Drum Relin Bog, in the parish of Inver, Co. of Donegal. It was formed of rough oak logs and planks, the mortices being apparently more bruised than cut, as if with a stone chisel and an instrument of that description was in fact found in the house. Any conjecture as to the age of this building must be extremely difficult, if not impossible. It appeared to have been overwhelmed by some sudden calamity, and probably the bog turf has grown considerably over it, the top of the roof being about sixteen feet below the level of the surface.—*Dublin paper.*

To Cure a Sprained Ankle pour on frequently a stream of SALT water from the nose of a coffee pot held up at arm's length.

GARDEN AND FLOWER SEEDS.

An excellent collection of GARDEN and FLOWER Seeds of very best quality, in papers of 61 cents each, constantly on hand and for sale at New England Seed Store of

GEO. C. BARRETT.

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

1 Case wet (but not damaged) Bishops Lawn.
 1 do. do. do. Book Muslin.
 Also, 1 do. Superfine 6-4 Cambric Dimoties, which will be offered by the Piece at 25 per cent. less than cost of importation. m 14

STRAW CARPETING.

ELIAB STONE BREWER, No. 414-Washington street, has received a lot of 106 pieces superior straw carpeting white and fancy checks, 5-4, 6-4, and 7-4 widths, which he will sell by the piece or yard at very low prices. Also, Canton Straw table matts. istf. a 16.

COMPLETE SET OF THE FARMER.

One complete set of 11 Volumes of the New England Farmer bound in excellent style. For sale at the Farmer Office. This will be found to make a valuable Library for an Agriculturist.

THE NEW ENGLAND FARMER

Is published every Wednesday Evening, at \$3 per annum, payable at the end of the year—but those who pay within sixty days from the time of subscribing, are entitled to a deduction of fifty cents.

No paper will be sent to a distance without payment being made in advance.

GRINDSTONES ON FRICTION ROLLERS.

The hanging of grindstones on Friction Rollers, and moving them with a foot-treadle is found to be a great improvement. The rollers almost annihilate friction, and as it is very easy to give them motion by the foot, the labor of one man is saved, and the person who is grinding can govern the stone more to his mind by having the complete control of his work.

Grindstones, hung in this manner, are coming daily more and more into use; and from the frequency with which they are employed, the apparatus sketched above, may well be numbered with the most important implements for facilitating the labors of the farmer as well as many classes of mechanics.

Stones of different sizes, and fitted as above may be obtained at the Agricultural Warehouse, Nos. 51 & 52 North Market street, Boston.

For the New-England Farmer.
SKINLESS OATS.

New York, June 28th, 1834.

MR. EDITOR, For the benefit of the agricultural interests of my native State, I enclose this slip taken from a stray paper, which, I hope may prove of some benefit to your valuable Society of Agriculture. J. BROWN.

Skinless Oats. At a late meeting of the Warwickshire Agricultural Society, a specimen of the *Avena* *Farina*, or skinless oat was produced by the Rev. Mr. Knott, which had been plucked that morning out of a piece of ground belonging to that gentleman at Wormleighton. It was produced from seed furnished to him by Mr. Trucker, of Heanton, Punchardon, near Barnstable, Devonshire. According to the account furnished by that gentleman, it was grown in the season of 1830, for the first time it was ever produced in Great Britain, by Thomas Drenzy, Esq. of Cleghem Hall, who obtained the seed through a friend of his at Rotterdam, whither it was imported from Shantung a remote district in China, and was quite unknown to Europeans till within these three years. The advantages which this extraordinary and valuable grain possesses over all other kinds of oats are numerous: When threshed from the sheaf it is exactly like oatmeal, and it is fit for immediate use for culinary purposes, and every other sort which oatmeal is consumed for, the grain being quite free from every particle of rind and husk.

The flavor is delicious, and it contains much more farinaceous matter. There is of course considerable saving of oats, and the expense of kiln-drying, &c. and one peck contains more nutritious food for a horse, than three pecks of common oats. The produce is most astonishing, the average being twenty-six barrels, of fourteen stone to the Irish acre, the exact quantity grown by Mr. Drenzy on one acre. It was not sown till the 4th of May, 1830, and was reaped early in August in the same year.—It is remarkably hardy, and well adapted to this climate.—*London Periodical.*

For the New England Farmer.

THE CICADA.

MR. FESSENDEN—Much alarm has been created among those whose reliance for a livelihood is on the fruits of the earth, by the annunciation that the land is this year to be overspread with Locusts. Many stories of the devastations committed by this fifth plague of Pharaoh have been collected and circulated; and it is doubtless impressed on the minds of multitudes, that we are, in reality, about to see this direful scourge of the East—that the earth is to be covered and the land darkened, and every herb of the land and all the fruit of the trees is to be eaten, and that no green thing is to remain in the trees or in the herb of the field. All this honest misrepresentation and consequent panic, only shows how much there is in a name. For these stories are in no important particular applicable to our insect. At your request, therefore, I offer the following, as the best account I can give of them. And why does not the entomologist do us great a service to the public, by being able to dissipate their groundless fears, as the astronomer, who by his labors, has taught us the cause, period and harmless nature of an eclipse, a phenomenon which is still regarded by the untaught savage with consternation.

The truth is, our Locust is not a *Locust*—it belongs to an entirely different order of insects. Its history, so far as I have been able to collect it is as follows.—It belongs to the genus *Cicada* of the order *Hemiptera*, section *Homoptera*. Some of the *CICADIADÆ* have long been celebrated for their musical powers; so much so, that a portion of them have been grouped together and distinguished by the name of *Cantatrices*, or singers. Their music, which is peculiar to the males, is not produced by the mouth, but by a musical instrument, something like a kettle drum in construction, situated under the chest and covered by two large scales or plates. They live on trees and shrubs, the juices of which they suck. For this purpose they are provided with a long, pointed tube, composed of several distinct pieces, which they fold underneath them when not in use. From the perforations which some of them make in a species of ash (*Ornus*) exudes the substance so well known to us under the name of manna. The female is provided with an ovipositor or auger, of a horny substance, about a third of an inch in length, usually resting in a sheath or groove in the body. This is composed of three pieces, two of which are spear-pointed and finely indented at the end with teeth like a rasp. With this she perforates obliquely the solid substance of the small twigs,

and then forming the three pieces into a tube, conveys her eggs through it into the opening. Having filled this with eggs, she moves a little, either along the limb or directly sideways, and performs the same operation until she has deposited all her eggs, which usually amount to from 500 to 700. The eggs are long, white and shining, and somewhat resemble herds grass seed. The perforations are marked by little elevations, caused by small splinters fixed at one end and detached at the other, thus serving as a lid or valve to the opening; and they look as if they might have been produced by shot, driven in at an angle of 45 deg. Virgil supposed that these grooves were actually caused by the bursting of the very shrubs from the loud and querulous music of the insect. They usually select dry twigs for this purpose, probably because the moisture of a green one would prove injurious to their eggs; and in the case of the seventeen year species, the shrub oak is most frequently sought. When the eggs are hatched, the young larvæ immediately enter the earth, which they reach either, by travelling down the tree, or according to some, by the dropping of the dead twig to the ground before they are hatched. In the earth they remain in a nymph state till the seventeenth summer, from which circumstance they receive their specific name, *Cicada septemdecem*. Of their development or mode of life in this state, little, if any thing, is known, though a course of observations is now in process from which we may hope to learn something, if the observers should be permitted to live out this insect's term of life. Probably, however, they are rather useful than injurious, by keeping down a superabundant growth of herbage.

Dr. Shurtleff, in a preceding number of your paper, by comparing the records of the appearance of the *C. septemdecem*, thinks there must be some mistake as to their period of appearance. This discrepancy is easily and satisfactorily removed. It is the same as to say that because calves may be born every month in the year, the period of gestation for the cow cannot be nine months. The seventeen year Cicada is in fact seen every year in some part of our land, and perhaps nearly every year in the same place, in small numbers. In 1831 I received specimens of it from Sandwich, Mass., in 1832 from Genesee Co. N. Y., in 1833 from Martha's Vineyard, and this year they are abundant in various parts of our land, especially at the south. Thus it will be readily seen how the same family or swarm shall appear and propagate only once in seventeen years, while members of other families may exhibit themselves at any time in the intermediate period.

There are several species of Cicada among us, to be found every year, but none of them in such vast numbers as to conceal the foliage and bend or even break down the branches on which they lodge, as does this species. Among them are the *C. pruinosa*, the most common, and the *C. tibicen*, which last measure two and a half or three inches in length, and it is said that the noise of a single individual is such that it may be heard a mile. The *C. septemdecem* may be distinguished from all the others in our land by its smaller size, being about an inch long, its black body, and the eyes

and nervures of the wings, usually of the color of brick dust or sealing wax.

As to their inclination or ability to do harm, these are both very small. What they do while under ground, as before observed, we know not. While among us, their only object seems to be, to pair, and deposit their eggs. For this purpose they live a merry day or two, subsisting on a few drops of sap, and stunning our ears with their noisy din, and then become a plentiful source of sustenance to many birds and beasts. It is said that the American savages have sometimes used them for food, but I am not aware that they are ever employed as such by civilized man. It is also said that life has been destroyed by them.—We can easily conceive them to have the power of inflicting severe wounds when confined in a hat or otherwise, by their powerful ovipositors, and these wounds may even prove fatal. But, on the whole, the Cicada is quite as harmless, and far less annoying than the mosquito. Its deafening din is far more tolerable than the shrill and quiet hum of the latter, and its hydraulic apparatus consumes a far less vital portion of our precious substance, than the sanguinary lance of the mosquito.

A short comparison of the Cicada with the true locust (*Gryllus*), will at once show the difference between the two insects, and the little reason there is to be alarmed at its appearance. The locust belongs to the order ORTHOPTERA, the cicada to the order HEMIPTERA. The form of the locust and its habits are the same as our grasshoppers, which are, indeed, our locusts;—that of the cicada, as is well known, is very different. The two grand differences, however, are, that the locust attains its whole growth above ground; and that, too, in the space of a month or two, and consequently requires a large amount of herbage to maintain its growth. While the cicada has obtained its full size and development when it first emerges from the ground, and requires little or nothing to support it during the few days of its existence. And again; the locust is furnished with powerful jaws for masticating his food, while the cicada has only a tube for taking in fluids, and is utterly incapable of devouring any thing. Apologizing for this long communication, I remain,

Yours, &c. AUGUSTUS A. GOULD.

July 3d, 1834.

IMPORTANT INVENTION.

Safety. THE apparatus for checking carriage wheels, invented by R. Jarvis, Esq. is worthy of public attention. It can be fitted to any vehicle, old or new, for a moderate expense, and is easily managed.

It will be useful in confining horses, or preventing them from running away, when harnessed to vehicles and left standing without being tied.

Applied to stage coaches, it will put the horses under the command of both passengers and driver; the means for checking either fore or hind wheels terminating inside of the coach, within reach of the former, and also forward within reach of the latter. Should the driver in stopping leave his horses untied, or should he attempt to race, or be thrown from his seat, or should the horses attempt to back over a bank or precipice, the wheels can be instantly checked by the passengers. So should the coach contain no passengers, and the horses attempt to back or run, the wheels can be checked by the driver.

It will be useful on fire engines, in suddenly

stopping them when necessary, and thus preventing the accidents that sometimes occur from their rapid movements.—*Boston Traveller.*

From the Cultivator.

CANADA THISTLE.

THE suggestion of our correspondent in the following communication, that frequent ploughing will destroy the Canada thistle, is in confirmation of the practice of Mr. Hillhouse, as related in the May number of the Cultivator. The object of both gentlemen was the same—to prevent the plant from vegetating; while the one used the plough, the other substituted the hoe for that purpose, and both it appears were effectual; these communications contain important suggestions, and we have no doubt they will be acted upon by some of our farmers the coming season.

We have this moment been called upon by a neighbor to the gentleman who sent us the above communication, who says the practice of killing the thistle in the above instance, as related by our correspondent, was so completely successful, that where any are now left, this plan to subdue them is invariably resorted to—that a small farm in the vicinity was sold a few years ago at the moderate price of not more than \$25 per acre, because the ground was almost covered with the thistle—that the method of frequent ploughing was adopted by the purchaser, and the thistles are so perfectly subdued that hardly a single one can now be seen, and this same farm would now readily sell at double the original price. We cannot for a moment doubt the correctness of the above statements, and if frequent ploughing is the remedy to destroy the thistle, a knowledge of the fact ought to be most extensively diffused.

A.

I am happy to perceive the attention of a subscriber is drawn to the destruction of the Canada thistle. What he writes is from actual experience, the best school extant. The gentleman's mode of destroying that most noxious of all weeds, (the Canada thistle) I conceive to be based on just principles, viz: that of totally depriving it of a top through one summer. This is an effectual mode of eradicating them; but I think we may pursue a system of management, where there are large quantities of this thistle in a more sure and effectual way, than the one in your May number of the Cultivator, signed by a Subscriber.—What I here state is also from actual experience. For the last four years I had two farms which were harassed more or less by the above named thistle, one of them being a small farm, was almost overrun with it, so much so, as to almost ruin both the grass and grain crop.—My mode of treatment is, to plant the field one year. That will subdue the sod. The next year commence as soon as the thistles come up in the spring to plough them, and continue to plough them, say once in two or three weeks, or as often as they come up or appear, until it is time to sow the field with winter grain. By this time the thistles if attended to as directed will be totally destroyed. I have killed last season full ten acres in this way; the season before as many more, and three years ago from one to two acres. Small spots may be wholly kept down in pasture fields by salting stock upon them, and at the same time see to them as often as once a week, that there are no tops left. If there are, strong brine, when the ground is moist poured upon them, will kill them, but if you kill all that are in sight to-day, in one week examine and

you will find more, so that it requires attention or else you will lose your labor; there is no half-way work about it; when they are bad in a stone wall the best way is to remove it to some other place not infected with them. The number of times of ploughing required to kill mine, has varied from five to ten times, and when the ground is bare, you can plainly see whether you have destroyed them or not.

If the above article should be the means of assisting the destruction on one square rod of ground covered with Canada thistle, the writer will be fully recompensed.

A SUBSCRIBER.

Chatham, Col'a co. N. Y. May 12, 1834.

From Goodsell's Farmer.

INSECTS ON APPLE TREES.

In many parts of the country apple trees are much injured by small insects upon the bark, which are commonly denominated lice.

These insects soon after they are hatched from the egg construct a covering over themselves, upon the bark, shaped somewhat like the one-half of a flax-seed, of a light brown color, which is capable of defending them from the weather, and also from many external injuries which might otherwise destroy them.—Beneath this shelter the parent insect supports itself, by perforating the bark through to the sap or young and tender part of the year's growth, upon which it feeds until the season arrives for its metamorphosis, when it changes shape, and deposits the eggs for the next generation and dies. These eggs hatch about the last of May, or from that time until the middle of June, according to the weather; after which they emerge from the shell made by the parent, crawl a short distance, generally upwards, fix themselves upon a smooth place on the bark, and in turn commence building each a shelter, for himself, perforating the bark and feeding upon the sap as before. By cutting beneath them with a sharp knife, a small brown speck will be discovered, indicating their perforation, and when they are very thick, the whole bark appears, when cut much injured, and of a brown color.

From the time of the hatching of the eggs, until they have formed their covering, they are easily destroyed, either by washing the trees thus infected with soap suds, or by washing and at the same time rubbing the tree with a brush, a coarse rag, or something of the kind, by which most of the insects will be destroyed by force, and those detached without being injured by force, will be destroyed by the solution.—Strong ley will answer the same purpose. Soft soap is sometimes used alone, which answers the double purpose of destroying the insects, and acting as a manure for the trees, as it is carried down to the ground by continual rains.

In applying soap or ley to fruit trees for the destruction of insects, it should be applied as far up the branches as possible, without getting it upon the leaves, as when of sufficient strength for the desired purpose leaves would be injured by it.

Some make use of lime instead of soap or ley, applying it as a whitewash; this gives the bodies of trees a very neat appearance, and no doubt prevents the ascent of many insects as well as the multiplication of others, but we do not think it so effectually destroys the small insects alluded to, as the other application.

*From the Cultivator.***THE CATERPILLAR.**

As much complaint is annually made of the ravages of the caterpillar among the farmers' fruit trees, and particularly in apple orchards, I feel desirous of rendering some service to the public by furnishing a remedy, which, from actual experiment, I am satisfied is effectual.

Place a sponge or swab made of rags, on the end of a pole, saturate it with lye made from common wood ashes; with this preparation give their nests a thorough washing early in the morning before these mischievous animals have gone abroad for their food. This will instantly prove fatal to them. Be careful to break the web of the nest because they are so constructed as to shed the rain and dews, the animal will thus escape. Not one of them can live a minute after being wet with this liquid.

Yours respectfully,

DAVID HUDSON.

J. BUEL—I see you have an article in the Cultivator, directing how to destroy the caterpillar.

I will state what I know to be a fact, that is, take a pail of soap suds, and with a swab attached to the end of a pole, swab the nest in the morning, and it will kill the worms and destroy the eggs. It is the best remedy I ever saw, and the quickest and cheapest.

A. BRIDGES.

Milford, May 17.

*From the Maine Farmer.***SPEAR GRASS.**

DURING the last season, a writer in your paper gave his brother farmers some very good and practical advice respecting spear grass. He asserted that it was a worthless grass, and easily removed, at least for the present in all arable land. From this hint one of my brother farmers informed me, that he set his plough a moving and turned in the worthless stuff, (that would not have yielded him more than enough per acre to have paid for the labor of mowing,) and sowed his land to oats and peas, and without manure. He procured a very large crop, and in addition he got rid of his spear grass at least for a number of years; for if he sowed it down to clover it would give a valuable return, and the land thus made to yield a good profit. I write to second the views of the writer above referred to, and to say that his hints have done good; and as I am not one who likes to see a farmer allow land to produce spear grass or any thing which gives him no profit, when it can be avoided at very little expense, and made to return him a handsome income, I hope all our farmers will plough up and destroy this pest, and that they will consider the difference between fencing and paying taxes for land that gives no profit, and the same soil rightly managed and giving a highly profitable crop. We farmers do not calculate enough.

A FARMER WHO SOMETIMES USES FIGURES.

LAND FOR CULTIVATION.

OUR correspondent in the following communication has touched upon an important subject. It will set farmers to thinking, and we trust lead them to important results. The writer is a practical farmer. We shall be glad to hear from him again.—*Portland Courier.*

"We believe that few farmers are fully aware of the importance of selecting the best land for cultivation. We will for example take two pieces of ground—With the same dressing and same

amount of labor, one piece will produce 25 bushels corn per acre, the other piece will produce 30 bushels corn per acre—making a difference (reckoning corn at the common price) of 5 dollars—sown to gain the different value of the crops on these two pieces will be two dollars per acre—and when laid down to grass mown for six years, the difference as above may be fairly estimated as decreasing from 2 to 1 dollar per acre. This will give an average difference of 2 dollars per acre for eighty years, a sum which at first glance would seem small and hardly worth the notice of the cultivator. But the question is, what is the difference of value in two pieces of ground! We cannot conceive the two dollars to be anything else than interest which will make the principal thirty-three dollars, the actual difference per acre between these two pieces of land. If we are right in the above conclusion (and if wrong we would solicit your correction, Mr. Editor,) it will be perceived that the relative value of land is far from being justly based, and that farmers should not be afraid of a little expense in clearing and fencing ground, where the soil is good and adapted to cultivation.

*From the Maine Farmer.***INDIAN CORN.**

I HAVE long been of the opinion that corn is the most uncertain and expensive crop our farmers attempt to raise, and that it would be well if the quantity should be limited to what is wanted for the fattening of their pork. Our seasons are not always sufficiently long to insure its perfection. Its growth, for a time is even more rapid than at the South, but does not all times arrive at maturity before the frost overtakes it. Much may be done to obviate this difficulty. An experiment was tried this season (it may not be a new one) to sprout the corn preparatory to planting; and it was attended with complete success. A hole was dug in the ground where a large heap had been burnt, to where the earth was about blood warm, four quarts of corn was put in and covered up with the warm earth taken out. The next day it was examined, and found sprouted. On the third day it was uncovered and taken out, bound together in one mass by the sprouts which were from an inch to an inch and a quarter long. In this case it was difficult to get the kernels apart without breaking the sprout, but that might be easily obviated by opening a larger surface to spread the corn in. I do not know that this has been practised by our farmers; if not it is worth trying. A pile of brushwood, the pruning of their apple trees, or even the small chips left in the door-yard, which every neat farmer ought to burn, will heat the ground sufficiently to try the experiment; but the case alluded to, was where logs had been piled and burnt off for the purpose of clearing the land; of course the ground was heated to a considerable depth.

PYRITES

—ARE inflammable substances composed of sulphur and iron or other metal, abounding probably in many parts of our country which are destitute of gypsum. In Flanders pyrites are used as manure particularly for grass lands, at the rate of about six bushels to the acre; the stone is sufficiently impregnated with sulphur to burn, when dry; when red with burning the fire is extinguished before it becomes black, and it is then easily reduced to powder.

MASS. HORTICULTURAL SOCIETY.

An adjourned meeting of the Mass. Hort. Society was held at their room on Saturday, July 5th.

There being no business before the Society, the sub-committee appointed at a former meeting made choice of the following committees, to make arrangements and preparations for the ensuing exhibition:—

To procure a suitable Hall for Exhibition, I. P. Davis, B. V. French, and J. P. Bradlee.

To solicit the loan of plants and flowers—and to ascertain the kinds and procure a list of such as it may be desirable to obtain—for Boston, I. P. Davis, Geo. W. Pratt, I. P. Bradlee, J. G. Joy, Wm. E. Payne.—For Charlestown, Lynn and Salem, David Fosdick, Thos. Mason, A. Houghton, jr. H. A. Breed, E. Putnam.—For Cambridge, Brighton, Watertown, &c. Jona. Winship, C. M. Hovey, David Haggerston, John Kenrick, J. W. Russell, Wm. Carter.—For Roxbury, Dorchester and vicinity, Saml. Walker, Thos. Brewer, John Lemist, M. P. Wilder, E. M. Richards, N. Davenport.

To attend to the financial department, procure tickets, &c. E. Vose, I. P. Davis, Dr. S. A. Shurtleff.

To conduct the necessary arrangements for the transportation of plants, to, and from the place of exhibition, Jona. Winship, Geo. W. Pratt, J. P. Bradlee.

Adjourned to Saturday, July 12, at 11 o'clock, A. M. CHAS. M. HOVEY, Sec. pro tem.

All the members named in the above committees are requested to meet at the Room of the Society on Saturday next, at the hour mentioned in the adjournment; as a prompt attendance is the only means by which the objects of the committees can be conducted with any effect.

EXHIBITION OF FLOWERS.

Saturday, July 5th, 1834.

Mr. SAMUEL DOWNER, Dorchester—large specimens of Greville Rose of various colors and shades.

Mr. THOMAS MASON, Charlestown Vineyard—*Amsonia salicifolia*, *Papaver warratah*, variety of Larkspur, do. Roses, double *Ranunculus*, *Anemones*, *Delphinium grandiflora*, Carnations, Moss roses, *Potentilla grandiflora*, and a variety of other flowers.

Mr. J. A. KENRICK, Newton—*Lonicera Fraseri* and *Chinensis*, *Calycanthus florida*, *Pæonia fragrans*, *Glycine frutescens*, *Spirea levigata*, *Magnolia glauca*, Roses, &c.

Messrs. HOVEY, Cambridgeport—Bouquet flowers, *Delphinium*, *Digitalis*, *Lychnis*, *Campanula*, Roses, Pinks, &c.

Mr. S. WALKER, Roxbury—Multiflora Rose, open culture, and specimens of various kinds.

Mr. WM. KENRICK, Newton—a great variety of Roses and other flowers.

Messrs. WINSHIPS—variety as usual.

By order of the Committee,
JONA. WINSHIP, Chairman.

FRUITS EXHIBITED.

Saturday, July 5th.

Royal Scarlet Strawberries from Messrs. HOVEY & Co.—fair quality.

Black Tartarian Cherries, from Mr. POND, Cambridgeport, and Downton Strawberries—all fine.

For the Committee on Fruit,
S. A. SHURTLEFF.

From Goodsell's Farmer.

EXPLANATION OF AGRICULTURAL TERMS.

(Continued from No. 49 of this Vol. N. E. Far.)

62. *Tiller*—is a term used to signify the branching out of a single grain as of rye, oats, or wheat, into several stalks. Where the individual kernels of any grain throw up many stalks, it is said to tiller well. Each shoot thrown out in tillering may be removed and treated as a distinct plant.—A remarkable instance of this is related in the fifty-eighth volume of the Philosophical Transactions. Of some wheat sown in June, one of the plants was taken up in August, and separated into eighteen parts, and replanted; these plants again taken up, divided in the month of September and October, and planted out separately to stand the winter, which division produced sixty-seven plants. They were again taken up in March and April, and produced five hundred plants; from which grew twenty-one thousand, one hundred and nine heads, yielding three pecks and three quarters, of wheat, all produced from one single grain.

63. *Ley*—a term used in agriculture, to signify land in a state of sward or grass. We frequently read of wheat being sown on a *clover ley*, by which we are to understand land, in clover, directly after mowing being turned up, and sown in wheat on the back of the furrows.

64. *Meadow*—grass land for mowing. In this country the word is seldom used to signify upland mowing but that which is low and moist, and seldom or never ploughed. In other countries and by some writers on agriculture in this country, it is the name given to all ground.

65. *Effluvia*—are those small particles flowing out of any substance, which produce in us the sensation of smell. Thus most flowers send forth effluvia; and substances in a state of putrefaction send forth effluvia of a very different nature.

66. *Chemistry*—is the science which enables us to discover the nature and the properties of all natural bodies.

67. *A Simple Substance*—is one which cannot be decomposed; or which is not produced by the union of two or more substances, such as iron, sulphur, &c. Sir Humphrey Davy, a celebrated chemist in England, reckons forty seven known substances in nature.

68. *A Compound Substance*—is one which may be decomposed; or which is produced by the union of two or more other substances of different natures. Thus, gunpowder is a compound substance, being composed of charcoal, sulphur, and saltpetre; and these substances, or those which united together, produce a compound substance, are called its *constituent* or *compound parts*.

69. *The Elements of Matter*—are the simple substances into which all surrounding objects are capable of being reduced. All the substances about which agriculture is employed are compounds; they consist of elements into which they are capable of being resolved. Of this no farmer should be ignorant; and he ought to attain at least to so much chemistry as to know the nature, the properties, and the combination of those elements (the number of which is very small,) which are continually working such wonders before his eyes.

70. *Analysis*—is the resolution or separating of a compound substance into elements or constituent parts.

71. *Caloric*—is the name which modern chemists have given to fire; it is that extremely subtle fluid which produces in us the sensation of heat.

The sun is the grand source of caloric; it is afforded also from combustion, and in various other ways. Thus take a small phial half full of water, grasp it gently in one hand, and from another phial pour a little sulphuric acid, or oil of vitriol as it is sometimes called, very gradually into the water. The phial will become hot, which is in consequence of the caloric disengaged from the mixture. This subtle matter pervades the pores of all known substances, most of which are capable of existing in *three different states*—the solid, the fluid, and the aeriform or gaseous state; and these different states depend on the quantity of caloric which may be present in any substance at *any one time*. The first of these termed the *solid state*, depends on the presence of a *small quantity of caloric*; such is water in the state of ice;—when the quantity of caloric or matter of heat is increased to a certain degree the body passes into the second or *fluid state*; such is the ice or lead when melted; and by still farther increasing the quantity of caloric or heat, it rises into vapor, called the *aeriform* or *gaseous state*, or simple gas. Almost all natural bodies are susceptible of existing from the mere expansive energy of caloric, in these three states; and the only difference among them is, that some require *less* and others *greater* portions of caloric to induce these changes. Water which usually exists in our atmosphere as fluid, can fluctuate by a very slight alteration of the thermometer, either into *solid ice*, or into aeriform vapor. All the metals exhibit the same phenomenon. If solid they melt by the application of fire into a fluid mass; and if that be carried to a given pitch of intensity, they fly off in fumes, and assume the gaseous state. The solid earth is not exempt from the dominion of this universal law. Flint and sand, when put into the furnace dissolves into liquid glass, and if exposed to a still more powerful heat, may dissipate in vapor and assume new aerial forms. Let it therefore be remembered, as an established principle in chemistry, that when different portions of *caloric* enter into combination with bodies, they pass according to the quantity, into the respective states of solidity, fluidity or aeriform vapor.

72. *Gas*—is any substance converted to vapor by the action of caloric. In other words, it is any substance reduced to the aeriform state by the action of caloric. By the *aeriform state* it must be remembered is meant a *state similar to that of air*; which is neither *tangible* nor *visible*; that is, it can neither be handled with the hands nor seen with the eyes. It may seem strange that the hard substance from which we receive so many knocks and brushes, should in any way be converted into such a state. Yet something of this is seen every day. A log which would require two men to lift, on being burnt is all converted into gas, except a residuum of ashes so small as to be collected into a measure and carried by a child. So in the putrefaction of an animal, the solid substance left is little more than sufficient to cover the ground: the rest, except some fluid parts which may have sunk into the soil, is converted into gas.

73. *Alkalies*—are substances of an acid burning taste. Their most distinguishing properties are, 1st, They change the blue juices of vegetables, as of violets or red cabbage to green. 2d, They render oils mixable with water, thus forming soap. 3d, They combine with acids, thereby forming various kinds of salts. There are only three alkali-

es; 1st, Potash, or the vegetable Alkali; 2nd, Soda or Mineral Alkali; 3d, Ammonia, or the Volatile Alkali. The two first are also called *Fixed Alkalies*: the latter, or Ammonia, is called the *Volatile Alkali*, because it exists as a gas, and is that substance which on opening a smelling bottle so effectually searches the nose and head.

74. *Acids*—are substances of a sour taste. The acids are very numerous. Their most distinguishable properties are, 1st, That they change to red those colors of vegetables which the alkalies change to green; 2d, They combine with alkalies, and thereby form a great many kinds of salts.—Thus the combination of muriatic acid with soda, forms common salt. Some of the acids are met with in a solid state: others in a fluid state, as vinegar: others in a gaseous state. Of the latter is Carbonic Acid, which requires a more particular description. The carbonic acid, when uncombined with any other substance, is always met with in a state of *gas*, and hence it is called *Carbonic Acid Gas*. It is the substance which was formerly called *fixed air*. It exists in a small proportion in the atmosphere. It destroys life and extinguishes the light of a candle when immersed in it. It is disengaged largely from liquors, such as beer, cider, or wine, when in the act of fermentation. It is this gas which produces the many unhappy accidents in some subterranean caverns, inclosed cellars containing large quantities of fermenting liquors, in some deep wells, and in bed-chambers, warmed by burning charcoal in pans. This acid combines with a great variety of substances, all which are called *carbonates of lime*, and the burning of limestone is for no other purpose, but to expel the carbonic acid, which is done by heat, in which operation the limestone loses nearly half its weight. The alkalies attract it from the atmosphere. It is present in pot and pearl ashes, from which it is disengaged by the addition of a stronger acid, as every one may have seen in throwing pearl-ash into cider, as some people do to drink in the morning. The acid in the cider in uniting with the pearl-ash, displaces the carbonic acid, which rises in the form of gas through the liquor, producing much foam with a hissing noise, called *effervescence*.

75. *Atmospheric Air*—or the air which surrounds the earth, is a mixture of two different kinds of air, called *Oxygen* and *Azote*. It likewise contains a small proportion of Carbonic Acid Gas, a substance already described. It is well known that no animal will live, or fire burn without air called *oxygen*, which is necessary for both. It is this which supports life and combustion; and when there is no oxygen, an animal will die, and a light will be extinguished as suddenly as where there is no air at all. All this may be made plain by a very easy experiment. Take a lighted candle, put it into a candlestick, and set it into a pail of water so deep that the light of the candle may rise three or four inches above the surface of the water. Then take a deep tumbler, or a wide mouthed decanter, invert it and let it down over the candle till the brim shall dip into the water. As the candle continues burning the water will be seen rising in the decanter till it shall be about one quarter full, when the candle will suddenly go out. Now the reason of water's rising in the decanter is, because the oxygen is gradually consuming by the lighted candle; and the reason the candle goes out is, that the oxygen at that instant is all gone, or has been

expended in the combustion. What is then left in the decanter, will be the other part or kind of air called *Azote*, and if a small animal should be introduced into this air, it would die as suddenly as if it had no air at all. Oxygen gas (for you must remember that every substance in the form of air must be called gas) is a very wonderful substance. It unites with iron when exposed to the atmosphere for any length of time, and converts it into rust, it unites with melted pewter or lead, and converts them into dross or oxide, as it is called; it unites with another kind of gas, called *Hydrogen* and forms water. Yes, what perhaps it may surprise you to know, *water* is not a simple as most persons suppose, but a *compound* substance, composed of Oxygen and Hydrogen gas. Both its decomposition and composition are common experiments in every chemical room. Oxygen likewise is one of the ingredients in the composition of acids, all which are compound substances; hence Oxygen has been called the great *acidifying* principle. Thus it unites with sulphuric acid, or oil of vitriol as it was formerly called: it unites also with carbon or charcoal, when burning, and forms carbonic acid gas, already described; and hence we see how the carbonic acid gas, which sometimes proves fatal in close shut bed-chambers, heated with burning charcoal, is produced. The oxygen in the atmosphere unites with the charcoal or carbon in burning, and thus produces this gas, so deleterious to life when breathed without a due proportion of atmospheric air mixed with it. These four elementary substances, *Oxygen*, *Hydrogen*, *Azote*, and *Carbon* possess a very wonderful agency in nature, and every one who has any wish to look beyond the mere surface of things, cannot but be gratified in knowing more about them. It is important that the character and distinguishing properties of each should be well understood. These are given in the following concise definitions, which are not to be forgotten; viz:—

76. *Oxygen*—is one of the constituent principles of water; it is called vital or respirable air, and is essential both to the support of life and combustion. This substance performs an important part in most of the changes which take place in the mineral, vegetable and animal kingdoms.

77. *Hydrogen*—is one of the constituent principles of water; it is very inflammable, and was formerly called inflammable air. It is the lightest of all ponderable substances. This is the substance generally used in filling air balloons. It is readily obtained by the decomposition of water. Vegetables and animals, also in a state of decay and putrefaction, afford it, and it is evolved from various mines and volcanoes.

78. *Azote*—is that part of atmospheric air which is incapable of supporting life or combustion. All combustible substances burn violently in pure oxygen gas, and if it was not diluted in the atmosphere by a large portion of azote, it would be impossible to extinguish any considerable fire when once lighted up, and something like the general conflagration of the whole world would immediately commence. Azote exists abundantly in nature, forming the greater part of the atmosphere, and is one of the principal ingredients in animal substances.

99. *Carbon*—is the pure part of charcoal. Carbon forms a large proportion of all vegetables; it exists also in animals, but its quantity is small.

From the Virginia Farmer's Register.

ON THE MANUFACTURE OF POTASH.

It is remarkable that the manufacture of potash which has formed so considerable and profitable an employment for the industry of the northern States, has never been in operation in Virginia. Of course no satisfactory answer to the following letter of inquiry on this subject was to be obtained at home—and it was therefore sent to a gentleman who resides at Cayuga county, New York, whose location, as well as his general information, it was inferred would enable him to give the statements required. He has kindly complied with the request, by sending the communication inserted below.

The enormous waste of wood throughout Virginia and the southern states, induces me to inquire whether a considerable saving to the country may not be effected, by converting a portion of it into potashes, and by preparing the bark of certain descriptions of trees, for tanning and dyeing.

In clearing our lands, it is the practice to burn all the wood which is not used for fence rails, and no care is taken of the ashes. It is well known that from the branches and twigs of oak, a larger quantity of potash is obtained than from the same weight of the trunk of the tree, and that the branches are entirely lost with us in clearing land.

Now my object in addressing you is to request that you will obtain and publish the most simple and clear directions for making and preparing potashes for market, embracing the cost of all requisite apparatus, labor, &c. and the quantity produced from a given weight or measure of white oak, red oak, and other woods common to our country. The preparation of bark for exportation might also be valuable, if the mode of doing it was made known to our farmers. QUERIST.

WILLIAM CULVER, Esq. from whom the following particulars were obtained, has been concerned in the manufacture of potash for many years.

It is estimated that 450 bushels of good house ashes will make a ton of potash. Some skilful workmen can produce more. The manager of his works contracted to make a ton from every 425 bushels; and he has even made that quantity from 420 bushels; but it is more than common workmen can produce.

Of field ashes about 550 bushels are required to make a ton. This difference is owing to impurities, and a want of compactness in the ashes. Great care should be used in scraping them up, so as to exclude as much dirt as possible. It requires more care to work them.

At this time, house ashes are worth ten cents a bushel, at the ashery, and field ashes seven cents.

One man can manage an ashery, consisting of the different vessels hereafter to be mentioned. There ought to be six leaches (or leach tubs,) each ten feet long, constructed in the following manner: Lay two parallel sills, one a little higher than the other. On these the bottoms of the leaches are laid—made of boards four feet long, not grooved and tongued, but breaking joints. These should be a foot high from the ground, so as to admit a trough under the lower edge to catch the ley, and to lead it into the ley tub, which may be a half hogshead sunk in the ground, and which will serve for two leaches.

The boards four feet in length which constitute the sides of the leach, are held together by two

rectangular frames; the lower one resting on the bottom is eighteen inches, and the upper, near the top of the leach, three and a half feet wide.

On the bottom of the leach lay small sticks crossing each other, to the height of two inches, for the purpose of letting the ley run off freely. On these place straw, to be four inches thick when well pressed down, to prevent the ashes from washing through and mixing with the ley. Three bushels of lime to each leach are spread on the straw; its effect is to facilitate the melting of the potash. Every third time that the leaches are filled, new lime is to be applied, after ejecting the old.

The ashes when thrown into the leaches must be made compact by pounding it down. In this way a leach will hold 60 bushels.

The leaches are worked in pairs. One pair may be running while the second is soaking, and the third is being emptied of old ashes, or being filled with new. This arrangement prevents the workman from losing time by waiting, or from being too much hurried at another time.

Two potash kettles of 90 gallons each, are wanted for boilers, and may cost about \$35 apiece. These are set in arches. Several sugar kettles, containing about twenty gallons each, will also be wanted for coolers.

The manufacture of potash is generally commenced in the spring, when there is no longer any danger from freezing.

Ley too weak to bear an egg, is not put into the boilers, but is used for wetting such leaches as have not begun to run.

During the boiling, a dipping pan is placed in each boiler, resting on the bottom, to catch the black salts as they settle; and when the pan is full, it is emptied from time to time. By this process, the ley will not become so thick, and consequently evaporate faster.

When the strong ley (such as will bear an egg,) from the two leaches, is all poured into the boilers, then increase the fire. For this purpose, good dry wood is necessary. The black salts are now to be returned to the boilers; and there will be a danger of the liquid running over. This is prevented by dipping it up and pouring it back into the boiler. Repeat it till this disposition to rise over shall disappear. Then raise the heat still more, till the potash is perfectly melted, and becomes almost as thin as water. It is then to be dipped out into the coolers, being careful to have them very dry. Let the potash stand till next day—it will crack into four quarters. Turn it out, and it is fit to barrel.

My informant suggests that there would be a great advantage in having some person to start the works, who was well acquainted with the business.

D. T.

LOCUSTS.

We have been disposed to ridicule the reports circulated in the papers, of the death of several children from the sting of locusts. But we learn that the bite, of this noisy visitor, has, in several instances, proved fatal. A black boy, in or near Newcastle, (Del.) last week, gathered several locusts, and put them in his hat, to be carried to school. While thus confined the animals bit his head in several places; in a short time the places bitten became inflamed; the head swelled very much, and the boy died in a few hours afterwards. We saw several sores on a person's hand, caused by the bite of locusts.—*Philad. U. S. Gazette.*

NEW ENGLAND FARMER.

BOSTON, WEDNESDAY EVENING, JULY 9, 1834.

MASSACHUSETTS AGRICULTURAL SOCIETY.

At the annual meeting of the Massachusetts Society for Promoting Agriculture held 11th June last, the following gentlemen were elected:

Hon. Thomas L. Winthrop, President;
Hon. John Welles, 1st Vice President;
Hon. Peter C. Brooks, 2d Vice President;
Hon. Richard Sullivan, Corresponding Secretary;
John Heard, jr. Esq. Treasurer;
Hon. John C. Gray, Recording Secretary;
Benj. Guild, Esq. Assistant do.;
Trustees—E. Hersey Derby, Esq., Hon. William Prescott, Hon. Daniel Webster, Israel Thorndike, Esq., Henry Codman, Esq., Josiah Quincy, jr. Esq.

CLOSE OF THE TWELFTH VOLUME.

THE present number closes the third volume of the new series, and the twelfth volume since the commencement of the New England Farmer. The termination of each volume presents a stage in our progress, in which we have been accustomed to look about us, and intimate what the view affords relative to the interests of the community of cultivators as well as to our own situation and prospects as regards the work in which we are engaged.

Many causes, since the establishment of our paper in 1822, have co-operated to encourage the hearts and strengthen the hands of the numerous and respectable class of mankind engaged in cultivating the earth. The progress of improvement in other arts has a tendency not only to augment the demand for the productions of agriculture, but to excite, enlighten and reward every effort to increase the quantity, enhance the quality and facilitate the means of obtaining those commodities which are indispensable to the existence of a great, active and intelligent population. Canals, rail roads, the multifarious methods and devices for employing steam, waterfalls, and other agents of super-human strength—laborers, which require no supplies of food or raiment, never suffer from fatigue, and never fail if skilfully employed to accomplish their tasks, have been set to work by mechanical ingenuity, in the service of agriculture; and made to reciprocate benefits with the great art, which is the source, support and indispensable requisite of all other arts. Agricultural implements, and the intelligence which renders them most effective have, also, since the period above mentioned been invented and brought into action in numbers and efficacy exceeding the most sanguine anticipations of the friends to improvement.

By the operation of the above mentioned and other agents in the train of causes and effects, connected with the progress of cultivation, lands in tillage have, in many instances, been made to double their products with the same amount of human labor. Improved breeds of animals, new articles and modes of husbandry, have also contributed to make the pursuits of the cultivator less laborious as well as more profitable. When Science speeds the Plough, Wealth and Honour are awarded to the Ploughman. With these considerations to cheer and encourage us, we propose to persevere in our attempts to render our journal still more useful and acceptable to the public. We solicit the aid of friendly and patriotic correspondents to enable us to accomplish those objects above mentioned. We should be thankful to receive for publication,

descriptions of improved implements, machines, &c. new and useful plants, improved breeds of animals, and all other articles useful or ornamental, which promise to give interest to the Farmer, and profit to its patrons and perusers.

Volumes of the New England Farmer for Agricultural Premiums. In the List of Premiums to be awarded by the Agricultural Society in Washington, Penn. in October next, we were much gratified to observe that sundry volumes of the New England Farmer are included. The most successful cultivators are to be rewarded by those most appropriate of all donations which not only afford encouragement and compensation for past, but contribute means for future improvement. We hope our New England Agricultural Societies will do likewise, and not suffer us to send all our good works to the other end of the Union, instead of distributing a part among our good neighbors.

N. B. Volumes of the New England Farmer, commencing on the 16th of July, 1834, will be furnished to Agricultural Societies, to be distributed for premiums in any number.

While speaking of encouragement afforded us by Agricultural Societies we cannot forbear to tender our thanks to the *Rhode Island Society for the Encouragement of Domestic Industry*, for their continued and liberal patronage of the New England Farmer.

The Index to the present Volume will be issued with the next Number if practicable, but if not, with the succeeding one.

From the Maine Farmer.

GARGET.

It cannot be otherwise than gratifying to the feelings of every one who is interested in the prosperity of our State, to view the general excitement which appears to be waking up in relation to the improvement of the breed of stock. But in proportion as our improvements progress, it becomes a matter of importance for us to acquire and disseminate every item of information within our reach for the prevention and cure of those disorders to which our cattle are mostly subject.

It is well known that the GARGET prevails among cows in this State to a very serious degree; and I believe in general the best cows are the most liable to have it, which often renders them as to milk, partially or wholly valueless. A friend of mine suggests the propriety and utility of raising Garget, (*Phytolacca decandra*.) His plan is to box up a small corner of the barn-yard and fill it with rich earth; in this the berries may be planted or the roots or plants set, so that the cattle may have free access to it through the season. He says that in the incipient stages of the disorder the cows will instinctively crop the leaves of the plant, and thus become their own physicians.

His cows have never been troubled with the garget since he has adopted this method, although he suffered considerably prior to it; and he very justly observes, that in those States where this plant grows in abundance, the garget among cows is unknown.

The *Phytolacca decandra*, or garget, is common in almost all countries. In Europe, it is found in Switzerland, Milan, Florence, Portugal, and Piedmont. I believe it is also a native of Japan. In America it inhabits a very extensive tract of coun-

try from New Hampshire to Mexico, and perhaps farther south. It generally grows along roadsides, along hedges, and in old fields. This is the proper season for setting the plants. The berries are at first of a green color, then red, and when fully ripe they are black; and the proper season for gathering them is in October, when they become soft and ripe. The root of the plant is to be gathered in November when the stalk is perfectly dead, and a bunch of berries may be planted in its stead at the same season of the year.

Its medicinal qualities have been held in high estimation by some, in Fevers, Cancers, Scrofula, Rheumatism, Gout, Dysentery, Eruptions, &c. It operates both as an emetic and cathartic, in its different preparations and application.

If a variety of names applied to a plant is in any way indicative of its usefulness, then surely this must be eminently so; for we find that in different places it is known by one or more of the following names: Garget, Cunicum, Cokecum, Julap, Poke, Poke-weed, Pork-weed, Pork-physis, Red weed of Virginia, Virginian Poke, Brauching Phytolacca, Skoke Cancer-root, American nightshade, and Red nightshade. But in New England, I believe it is mostly known by the name of Garget.

CAROLUS.

June 21, 1834.

ITEMS OF INTELLIGENCE.

The Locust. These noisy visitors have been with us about a month, and the extinction of the present generation of them is apparent from the numbers that are found dead, and the feeble tones of the remainder. The power applied to their incisors in penetrating the young branches of trees, wherein to deposit their eggs, is almost incredible. We have twigs of last year's growth, upwards of a quarter of an inch in thickness, penetrated to the heart by these insects.—*Harrisburg Chronicle*.

Northern Adventure. Among the adventurous excursions planned by Englishmen for the present summer is one to visit a mountain between the 66th and 67th degree of north latitude, not far distant from Tornes, at the extremity of the Gulf of Bothnia, from which point, during the latter part of the next month the sun may be seen at midnight. The facilities for this undertaking are, however, greater than is generally imagined. By the steamboats from Hull, Stockholm may be reached in eight days, and the river may be ascended in boats to nearly the point desired; while to those who prefer travelling by land, relays of horses, which are abundant in that country, are to be obtained on moderate terms. The natives go from great distances to visit the spot mentioned, and to pass Midsummer-eve on the mountain, of which a species of festival is made, (from the varieties of costume and rustic finery,) said to be of a very striking and picturesque effect.

Cat and Rabbits. On a journey recently, while stopping for a short time at the house of a gentleman in Orange, Vermont, we were somewhat interested and amused at seeing a lot of young rabbits nursed by a cat.—The owner of the cat had destroyed two of her kittens, preserving only one.—The night after she took to the woods, returning in the morning with two young rabbits, and the next night, repeating her visit, brought home a third, all of which she has adopted, and the kitten and three rabbits are thriving together, under the impartial and affectionate attention of Grimalkin.—*Portsmouth Jour.*

The present number of members of Temperance Societies in England and Wales is 80,198, showing an increase during the last month of 3,621, of whom 783 are the produce of 14 new societies.

There is an orange tree in Versailles which is still vigorous and flourishing, and is ascertained to be over 400 years old. It is called the Bourbon, and belonged to the constable of that name in the beginning of the 16th century, and confiscated to the crown in 1522, when it was already 100 years old.

Singular Tree. We have observed, on the farm of Mr. George Pettit, a mile below the village, a somewhat curious tree. A large chesnut, four feet in diameter, was felled close to the ground, some years since, and a number of scions, to the amount of twenty, have sprung out of, and ranged themselves around the edge of the stump in regular succession, forming a complete circle, and leaving the centre perfectly empty. These scions are now from three to five inches in thickness, and the whole resembles more the precision of art than the irregularities of nature.—*Hempstead (L. I.) Inq.*

Effects of the May Frost in Ohio. The following is an extract from a letter of a correspondent at Loydsville, Ohio, dated June 17, 1834:

"The frosts have been terrible. All the standard fruits are dead—one eighth exotic gooseberries left—more natives—currants plenty; also, native strawberries—the cultivated kinds chiefly killed. Grapes all killed, except a few dormant buds that pushed forward after the frost. The leaves of the fox grape were not killed. The Isabella stood the freeze on the 27th April—thermometer 27 deg. before sunrise; but was killed 15th May, thermometer 25 deg. All other kinds, including the wild chicken grape, were killed by the first frost. Forest trees were generally killed. No rain of consequence since last frost. The wheat killed has sent out suckers, and the crop will have short straw and heads, but may be tolerably fair."

To destroy Caterpillars.—To fifteen gallons of water add 1-4 pounds of common soap, the same quantity of flowers of sulphur, and 2 pounds of mushrooms, (the poisonous kind.) Put the whole over a moderate fire and keep it stirring. Caterpillars, grubs, &c. watered with this liquor, immediately perish.

This recipe is said to come from Germany, where it has extraordinary success.

Scotch Method of preserving Eggs. Dip them during one or two minutes in boiling water. The white of the egg then forms a kind of membrane, which envelops the interior and defends it from the air. This method is preferable to the varnish proposed by Reaumur.

Substitute for India Ink.—Boil in water some parchment, or pieces of fine gloves, until it is reduced to paste. Apply to its surface while still warm, a porcelain dish which has been held over a smoking lamp: the lamp-black which adheres to it will become detached and mingle with the paste or glue. Repeat the operation until the composition has acquired the requisite color. It is not necessary to grind it. It flows as freely from the pencil as India Ink, and has the same transparency.

The use of Gunpowder on the Fourth has caused a number of distressing accidents, but it is thought not so many as in former celebrations.

DISHLEY, OR NEW LEICESTER SHEEP.

Two Rams and one Ewe, with her Ewe Lamb of four months old, of the pure breed as above—were imported from England last year from one of the most celebrated flocks, superior as a large mutton breed, and also very heavy fleeces of long combing or worsted wool.

Also, a very fine, 3 year old Bull, 3-4 blood Durham Short Horn.

Apply to JOHN PRINCE.
Jumica Plains, June 25th, 1834.

WHITE DUTCH CLOVER.

RECEIVED this week direct from Holland 1000 lbs. superior White CLOVER, warranted free from any kind of foul seed, and at least worth one third more than American. This will be found an excellent Grass for Pasture land, &c.

at GEO. C. BARRETT, New England Seed Store.

ISLAND IN THE WINNEPISGEE LAKE FOR SALE.

Will be sold at public auction, on the premises, on THURSDAY, the seventeenth day of July (unless previously disposed of at private sale,) the Island in Winnepesaukee Lake known as MERINO ISLAND.

This island is situated within the limits of Tuftonborough, N. H. about 35 miles from Concord, and one quarter of a mile from the mainland. It contains between five and six hundred acres, and is admirably calculated for a sheep and dairy farm, for which it has for several years past been very successfully cultivated. It is in two parts, connected by a neck two rods wide. One part (of which about one half is cleared, and the other in forest) contains the pasture, nearly 300 acres in extent, of very high and sweet feed—the other part, about 200 acres, (of which two thirds are cleared,) contains all the buildings, which are extensive and very convenient, having all been erected by the present proprietor within ten years. There is a comfortable farm house, of 48 by 24 feet; a barn 80 by 40, with a shed up to the eaves on three sides, of 15 feet wide for sheep; another barn of 50 by 30 feet for cattle and horses; a dairy and cheese house, with ice house connected; corn-barn, and wind-mill, nearly new.

At the same time and place, will be sold the STOCK now upon the island, consisting of about 500 Sheep and Lambs, of the best merino and Saxony blood; an imported Bull (full blood North Devon); about 30 Cows and Heifers, chiefly of the Alderney and Durham breeds; a yoke of Oxen, and two yoke of Steers. The horned stock are all very superior animals, and the butter and cheese from this dairy has commanded the highest prices in Boston for the last three years.

Also, two MARES, four and five years old, sired by Barefoot, of much promise; one other Mare;—also the Swine—and all the Farming Tools.

The Steamboat leaves Alton on Tuesdays, Thursdays and Saturdays, and Centre Harbor on Mondays, Wednesdays and Fridays, and will land passengers on the island.

For terms and conditions of sale, apply to PRESCOTT & DERBY, No. 16 Court st. Boston, and for view of the premises to Capt. PILSBURY, on the island. jy 2

DAMAGED BISHOPS LAWN AND MUSLINS.

ELIAB STONE BREWER, at No. 414 Washington Street, will open for sale this day,

BRIGHTON MARKET.—MONDAY, July 7, 1834.

Reported for the Daily Advertiser and Patriot.

At Market this day, 290 Beef Cattle, 28 cows and calves, 3275 sheep, and 50 swine.

PRICES. Beef Cattle—A falling off from last week of nearly 25c per hundred lbs. the cattle generally being of an unusual good quality, a few were sold nearly as high as last week. We quote prime at 5 67 a 6; good at 5 50; thin at 4 25 a 4 75.

Cows and Calves—Sales were effected at 18, 21, 22, 24, 25, 27 1/2, 30, and one at \$40.

Sheep—There was a great difference in the quality, and sales were effected to correspond. We noticed lots taken at 1 33, 1 33, 1 42, 1 62, 1 71, 1 88, 2, and 2 17; also lots at 2 25 and 2 37. Weathers at 3, 3 33, and 3 50.

Swine—We noticed one lot of large hogs, more than half barrows, taken at 5c.

MISCELLANY.

TO THE SUN.

From the Pearl.

BY MISS A. C. LYNCH, OF HARTFORD.

Thou glorious lamp of Space! Thou that dost flood
The void of heaven with brightness! in thy glow
Unnumbered worlds, age after age, have trod
In their appointed paths, and yet thy flow
Of lustre hath not ebbed.—Before thy brow
The stars still veil themselves—thy burning glance
Is all unquenched, undimmed, unchanged e'en now
As when the finger of Omnipotence
Pointed to thee thy throne amid the vast expanse.

Yes, all unchanged.—As on that morn when rang
The shouts of joy as forth thy rays were spread,
While all the morning stars together sang,
So thou art now! The morning stars have fled,
The towering hill with age has bowed its head,
The sea has changed its home with the dry land,
The earth has gathered in her countless dead
Again and yet again—but thou dost stand
Exhaustless and unmoved, upheld by God's own hand!

Thy beams rest not alone where monarchs dwell,—
They linger round the cottage of the poor,
And pierce the gratings of the captive's cell—
And when thou lookest on the lowliest flower
That lifts its head to thee but for an hour,
Thy glances just as mildly, gently burn
As when thou gazest on the loftiest tower,
Or on the countless worlds that round thee turn.

Oh! what a lesson here might human frailty learn.
Thou lookest upon the earth, and in thy rays
She brings her increase forth. Thine early light
Unfolds the bud, and thy intenser gaze
The blushing summer flower. Thou takest thy flight
And o'er the earth then walks the starry night.
Thou guidest the waters of the unquiet main
Whose billows foam and tremble in their might—
For o'er the winds of heaven thou holdest thy reign
From the soft flower-kissed breeze to the wild hurricane.

When I behold thy bright, alchemic glance
A flood of gold-light o'er the landscape throw,
Or every cloud that decks the blue expanse
Beneath thy gaze with deepening blushes glow,
Or when I see thee tint the heavenly bow,
Or with thy gaze the ice-bound waters melt
As spring returns before thy burning brow,
I wonder not that Persia's children knelt
And deemed thou wast the Heaven wherein the Eternal dwelt!

Thou isle of brightness mid an azure sea!
As oft I gaze on thee at closing day,
I feel my spirit fluttering to be free,—
To cast its bonds of ignorance away,
And learn thy mysteries—and then I say
Peace my sad thoughts! but yet a little time
And your frail prison will have changed to clay
And ye shall stand before the throne of Him
To whose veiled brow of light this glorious lamp is dim!

FIRE.

ACCORDING to Pliny, fire for a long time was unknown to some of the ancient Egyptians; and when Euxodus, the celebrated astronomer, showed it to them, they were absolutely in raptures.

The Persians, Phœnicians, Greeks, and several other nations, acknowledged their ancestors were once without the use of fire; the Chinese confessed the same of their progenitors. Pomponius Mela, Plutarch, and other ancient authors, speak of nations, who, at the time they wrote, knew not the use of fire, or had but just learnt it. Facts of the same kind are also attested of several modern nations.

The inhabitants of the Marian islands, which were discovered in 1521, had no idea of fire. Never was astonishment greater than theirs, when they saw it

on the descent of Maghellan on one of their islands. At first they believed it to be some kind of animal that fixed itself to and fed upon wood. The inhabitants of the Philippine and Canary Islands were formerly equally ignorant. Africa presents, even in our days, some nations in this deplorable state.—*Park's Chemical Essays.*

ANTIQUITIES OF SOUTH AMERICA.

THE following article appears in a late number of the Monthly Review.

A German merchant residing at Valparaiso in Chili, who is a great amateur of antiquarian research, some time ago engaged an intelligent Dane named Kenons, to explore some of the wild regions of Chili, which probably had never before been visited by European travellers. This man is said to have made the most interesting discoveries. Among the Andes of Chilon he has found an extensive plain, over which were scattered the ruins of a considerable city. As the Indians of Chili have always been nomades, and as the incas never succeeded in establishing their power in that country, it may be concluded that the city above mentioned was built and inhabited by a civilized people, who have subsequently entirely disappeared. It is alleged that in other parts of South America there have also been discovered traces of high civilization, no remains of which are observable among the Indians who now inhabit those countries.

SAGACITY OF ELEPHANTS.

ELEPHANTS in peace and war know their duty; and are more obedient to the word of command than many rational beings. It is said they can travel on an emergency, two hundred miles in forty-eight hours, but will hold on for a month at the rate of 40 or 50 miles a day with cheerfulness and alacrity. I performed my long journey upon an elephant given by Ragobah to Col. Keating; nothing could exceed the sagacity, docility and affection of this noble quadruped; if I stopped to enjoy a prospect, he remained immovable until my sketch was finished; if I wished for ripe mangoes, growing out of the common reach, he selected the most fruitful branch, and breaking it off with his trunk, offered it to the driver, for the company in the houdah, accepting of any part given to himself with a respectful salaam by raising his trunk three times above his head, in the manner of the oriental obeisance, and often did he express his thanks by a murmuring noise. When a bough obstructed the houdah, he twisted his trunk around it, and though of considerable magnitude, broke it off with ease, and often gathered a leafy branch, either to keep off the flies, or as a fan to agitate around him, by waving it with his trunk. He generally paid a visit to the tent door during breakfast, to procure sugar candy or fruit, and to be cheered by the encomiums and caresses he so deservedly met with; no spaniel could be more innocently playful, or fonder of those who noticed him, than this docile animal, who, on particular occasions appeared conscious of his exaltation above the brute creation.—*Forbes.*

PRIVATE LIFE IN A PUBLIC HOUSE.

A PERSON from the country, who had been some months landlord of an Alnwick public house, was complaining to his friends of the dulness of trade, and said, if he could make up his mind to lead a retired private life he would certainly keep a public house at Alnwick.—*Newcastle Press.*

FOR THE CURIOUS GRAMMARIAN.

THERE is some ingenuity in the grammatical play upon the word *THAT* in the following lines which we copy from the Catskill Recorder, though they do not appear to be original in that paper. One would hardly believe it possible, without seeing an example, that any word in the English language was so variable in its signification, that it might be used seven times in succession without any intervening word, and yet preserve sense and grammatical correctness. The last line but one contains the word *that* seven times, which may be parsed as follows:—

The first is a conjunction; 2d is a demonstrative adjective pronoun agreeing with the 3d; the 3d is a noun, the nominative to *is* in the following line; the 4th is a demonstrative adjective pronoun agreeing with the 5th, the 5th is a noun in apposition with the 3d; the 6th is a relative pronoun referring to the 5th for its antecedent and governed by *begin*; and the 7th is a noun and governs *begin*.—*Portland Argus.*

GRAMMATICAL TAUTOLOGY.

I'll prove the word that I have made my theme
Is that that may be doubled without blame;
And that that *that* thus trebled I may use,
And that that *that* that critics may abuse
May be correct. Further the Dons to bother—
Five *thats* may closely follow one another!
For be it known that we may safely write
Or say, that that *that* that that man writ was right;
Nay, e'en that that *that* that *that* that followed
Through six repeats the grammar's rule has hallowed;
And that that *that* (that *that* that *that* began)
Repeated seven times is right!—Deny it who can.

GARDEN AND FLOWER SEEDS.

An excellent collection of GARDEN and FLOWER Seeds of very best quality, in papers of 61 cents each, constantly on hand and for sale at New England Seed Store of
GEO. C. BARRETT.

DAHLIAS.

A Collection of fine Double DAHLIAS, started in pots at 50 cents, for sale at the New England Seed Store, 51 & 52 North Market street.
